Easter trade here was very good. Harrisii in big demand with short supply. Roses were very good as were carnations.

Owing to the terrible dry spell here the seed crops of California in some respects, are going to be very short. Sweet peas for instance will be very short. M. Lynch, Timothy Hopkins and C. C. Morse predict a big shortage in sweet pea seed this year. These three firms have enormous quantities of them planted, but without rain they cannot accomplish anything. The weather is very hot.

The Midwinter Fair does not seem to help the trade very much.

Carbone's nursery at Alameda was sold by the sheriff the other day.

Mrs. Holbrow, on Polk St., has sold out to Mann & Shaw and has gone on a trip to Europe.

Carbone & Monti sold out to Figone Pelicano & Co. who are doing well.

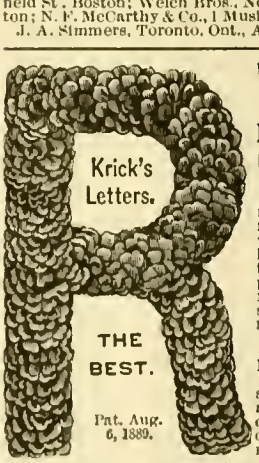
IMPROVED GLAZING.



GASSER'S PATENT ZINC JOINTS for putting glass makes greenhouses air and water tight; also prevents sliding and breakage from frost. Does not cost as much to heat a house glazed with the joints, thereby saving enough in fuel to more than pay the additional cost of glazing. The leading florists of the country are using them. Write for circulars with full particulars and price list.

Trading on Death.

One of the daily papers justly scores a florist in one of our large cities who has passed the bounds of all decency in soliciting orders for funeral work. The daily relates the case as follows:

"Not long ago the treasurer of one of the theaters passed away. The florist in question heard of the death and immediately hastened to a telegraph office, where he indited messages to the managers of well-known dramatic and operatic stars in various parts of the country. These messages related briefly the death of the treasurer and concluded with these words: 'Shall we send floral piece to funeral for you? Can insure you good press notice.' Think of it! A thrift which trades on death. And journalism must lend itself to the ghastly scheme by indorsing it through 'good press notices.' No reputable business man would sink so low as to solicit business by such questionable methods. That florist is one of the meanest men since Adam."

The serious injury to the standing and dignity of the trade by such bitter criticisms of those who disgrace it is difficult to calculate. While it may be impossible to drum the ghouls out of the profession certainly some steps should be taken to protect the fair name of the trade in the matter, for in the average mind the stain attaches to all the florists to a greater or less degree. We hold that the matter is of sufficient importance for the national society to take action upon. Let it be made a qualification for membership that the applicant can show a clean record, free from any stain through the employment of disreputable methods to obtain business. Let the public be well and thoroughly informed that the representative national association of the trade repudiates with disgust and loathing all who so transgress the bounds of decency as the man referred to in the extract we have quoted.

DO YOU WANT a list of the leading park superintendents of America? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

OUR trade directory and reference book for 1894 contains 270 pages of information of real practical value to every one in the trade. Price $2.00.

DO YOU WANT a complete alphabetical list of chrysanthemums in commerce in America, with class, and brief, accurate description of each? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

Funeral of the late Myron A. Hunt.

The earthly remains of Myron A. Hunt were laid to rest in Highland Lawn Cemetery, Terre Haute, Ind., last Thursday, April 26, with most impressive and appropriate ceremonies. In addition to his hosts of local friends and neighbors, and the florists of his own city, there were present from a distance the following friends in the trade: W. G. Bertermann, Anthony Wiegand and H. Rieman, Indianapolis; Fred Dorner, LaFayette, Ind.; E. G. Hill, Richmond, Ind.; J. M. Jordan and E. H. Michel, St. Louis; J. T. Anthony, J. C. Vaughan, P. J. Hauswirth, E. H. Hunt and wife, Miss S. Chandler, and G. L. Grant, Chicago; J. D. Carmody, Evansville, Ind.; J. S. Stuart, Anderson, Ind.; W. W. Coles, Kokomo, Ind.; R. R. Miller, Hinsdale, Ill.

The funeral services were held at the First Congregational Church, of which Mr. Hunt was a member, and were conducted by the Rev. Mr. Crum, pastor of the church, assisted by Mr. E. G. Hill, a close and intimate lifelong friend of our departed brother. The pall bearers included four members of the church and four friends in the trade as follows: John G. Heinl, Terre Haute; W. G. Bertermann, Indianapolis; Fred Dorner, LaFayette, and J. M. Jordan, St. Louis. The church was handsomely decorated with plants contributed jointly by John G. Heinl and his brother Lawrence Heinl, and on the platform were arranged among the plants the numerous floral tributes. Among the latter were a pillow, from the Society of Indiana Florists; a standing anchor, from the New York Florists' Club; a crescent wreath of roses, valley and cattleyas, from the Chicago Florists' Club; a wreath of camellia leaves, tied with purple ribbon, from the St. Louis Florists' Club; a handsome bunch of Uncle John carnations, arranged with Asparagus plumosus, from Mr. Fred Dorner, LaFayette, Ind.; a pair of cycas leaves bearing a crescent wreath of superb Bride and Bridesmaid roses, from E. Wienhoeber, Chicago; a crescent wreath, from John G. Heinl, Terre Haute; a cross, from Lawrence Heinl, Terre Haute; a pair of palm leaves, from the local Y. M. C. A.; a shield from the local Christian Endeavor Society, and others.

After the usual funeral ceremonies of the Congregational Church were concluded Mr. E. G. Hill delivered a very affecting address on the life of his and our dead friend. He said Mr. Hunt had entered the profession at a trying time in its history and had done much to assist in advancing it to its present dignity and standing. He quoted the well known remark of Canon Hole: "He who would have beautiful roses in his garden must have beautiful roses in his heart," and said "Myron A. Hunt had beautiful flowers—beautiful roses, in his heart and he nourished them with beautiful thoughts and an abiding love. He loved them next to his Creator and the wife of his bosom. I well remember the look of admiration and love on his kindly face as he showed me a flower of a beautiful seedling rose he had grown, saying: 'What a lovely thing it is! A gift to us from God, who vouchsafes to man so many beautiful things!' He loved everything in nature, which he accepted as visible manifestations of the goodness of the Creator to man. He was always an earnest supporter of the right and an opponent of the wrong. He was always found on the right side. No man can say that he ever received aught but evenhanded justice from Myron A. Hunt. And one of the most beautiful phases of his character was his tender love for her who had been his companion and helpmeet for more than a quarter of a century. The relations between this wedded pair were truly ideal. Let me read you the dedication of the useful and valuable book he recently contributed to the literature of the profession, 'How to grow cut flowers.' From this you can see the wealth of love for her that surged in his heart. It is as follows: 'To her who has walked by my side for nearly a quarter of a century, has tenderly cared for me in sickness, cheered me in days of adversity, and earned her full share of the rest that has come with the eventide of life, to my loved wife in this volume dedicated.' Every word came from his heart and we who know the intensity of his nature can understand what a shock to his reason was the announcement that this beloved wife was hopelessly insane—that while the body remained, the soul with which he had so long been in loving communion had fled to return no more. The cord that held both souls had broken, and his had gone to resume above the companionship so rudely rent here. The act that took the semblance of life from that clay was not the act of Myron A. Hunt but of the body from which the soul had already taken its flight."

Mr. Hill gave also a brief outline of the life of his friend, as covered in our announcement in last issue, and related various incidents illustrating his noble qualities of mind and heart. At times he was so deeply affected that he found difficulty in continuing and there were few dry eyes in the church when he concluded.

Pastor Crum also related numerous instances of Mr. Hunt's earnest religious feeling, his generosity and benevolence, and his active interest in all that would advance the cause of Christianity.

At the grave the ceremonies were brief and simple and on this beautiful spring day the mortal remains of Myron A. Hunt were placed in the bosom of mother earth in a lovely spot overlooking the broad valley of the Wabash. Peace to his ashes.

Mr. John G. Heinl generously took upon

himself the task of caring for the members of the profession from a distance who had been called to Terre Haute by the sad event. The visitors gathered at his store as they arrived and he had provided conveyance to the residence, which is some three miles from the centre of the city. In the evening all dined with him and enjoyed his hospitality and that of his charming wife and family until the time of departure of the various trains.

Mr. Hunt's affairs are left in an unfortunate condition. His will, made some time since, leaves everything to his wife and makes her executor of the instrument. As she is now insane she is of course incapable of acting. While the family have of course given these matters no thought as yet, it would seem that it will be necessary to ask the Probate Court to appoint a conservator for Mrs. Hunt and that he be given power to administer the estate. Of the seven children five are minors. The oldest son, who bears his father's given name, is 26 years of age (and not 20 as an error made it appear in last issue). He is married and is studying with a view to becoming an architect. He was unfortunately in Naples, Italy, at the time of his father's death and of course it was impossible for him to reach home in time for the funeral. The other two sons are aged 19 and 17 respectively.

The following from the Terre Haute *Gazette* of April 23 gives fuller details regarding the unfortunate event than we were able to secure in time for our last issue.

"The many friends of Mr. M. A. Hunt, who owns the rosary southeast of the city, will be greatly shocked to learn that, about 5 o'clock this morning, he shot himself through the heart, dying probably instantly. About five o'clock one of the men who works about the greenhouses heard a pistol shot and entering the room formerly occupied by Mr. Hunt as an office, found him lying dead with a bullet hole through his heart. He had no clothing on except an undershirt, a nightgown and a pair of slippers. The pistol, used by him for self defense in his journeys, was lying by his side and the left hand, which fired the fatal shot, was blackened with the burnt powder. Scarcely any blood was seen on the floor or on his garments, the hemorrhage having been internal. Mr. Hunt left his bed this morning while all his family were asleep and proceeded to his greenhouses which are possibly 300 yards east of his residence, without having been seen by any one.

"There is not the least doubt that Mr. Hunt was insane. Early in January he began to have violent pains in his head. While in Chicago on business about the middle of January his wife was telegraphed to go there as he was very sick. She found him in an almost unconscious condition and suffering from terrible pains in his head and several weeks passed before he was able to return home. In the meantime Mrs Hunt became insane, owing partly, doubtless, to her great anxiety for her husband. This greatly depressed him and he became gloomy and taciturn, declining, as a general thing, to receive calls from old acquaintances and friends who would have been glad to sympathize with him. He has for some months past given but little personal attention to his business, his sons and employes having looked after his affairs.

"During these months, though formerly a regular attendant at the Congregational church, he has been able to go but a few times. He has made mistakes in business and there have been increasing symptoms for several weeks that his mind was giving way under the terrible strain of his family troubles and his continued ill health. He has been able to sleep but a little for some weeks after two or three o'clock in the morning, when his dreadful headaches would commence, during the awful paroxysms of which he has seemed at times temporarily insane and the family have been carefully watching him for some time, fearing some such denouement. Yesterday he was free from pain and seemed comfortable and very happy. It is probable that early this morning his usual headache came on again, and during the attack he took his life.

"Some weeks ago Mrs Hunt was taken to Dr Fletcher's private asylum at Indianapolis. About ten days ago she was brought home again, her family thinking that the change might benefit her, but she rapidly grew worse and last Saturday the papers were made out and she was sent to the State Asylum in Indianapolis.

"Friends who drove out from the city early this morning, immediately on receipt of the dreadful news, say the most pathetic sight of their lives they witnessed in the greenhouse, where the body of this kind and gentle grey haired man lay surrounded by the almost frantic members of the family.

"No scrap of paper could be found except a tablet in the house on which Mr. Hunt was seen writing yesterday. There are four verses addressed to his wife, recalling the bright and happy days of their youth, expressing the hope that they might take no their old lives again here on earth and the belief that, if this is denied, they will meet in the life beyond. Few lines of deeper pathos have ever been written.

"In the greenhouse Mr. Hunt apparently wrote nothing this morning, but he took with him a locket containing something presented to him by his wife, also jewels which were the gift of the Christian Endeavor Society. He pushed his night shirt aside and fired directly over his heart.

"The family has the sympathy of the entire community. Mr. Hunt left a married daughter who lives in Boston, a married son, Mr. Myron Hunt, an architect who is studying in Europe, and three daughters and two sons who are still living at home. They are Misses Kittie, Fanny and Sarah and Messrs. George and Charles.

"Mr. Hunt had a very prosperous business and was in easy circumstances. He had recently purchased a beautiful site on the bluff near his present residence, which he had graded and planted with trees and was expecting to build upon soon. He was one of Terre Haute's very best citizens. He was generous to a fault and was one of the strongest supporters of the Congregational church and the Y. M. C. A., of which he was a member. His death is a public loss and he will long be remembered with affection."

It may be well to add here that the rumor circulated by a daily press dispatch to the effect that Mr. Hunt was in financial difficulties had absolutely no foundation whatever. The accounts of the various societies of which he was treasurer are all in first-class shape.

Carnations.

On account of the backward spring there are quite a number of carnations not yet planted out, and it may be well to consider a few points on that phase of carnation culture. In a former number I gave my ideas regarding the planting out of carnations, but a difference in the season sometimes necessitates a difference in one's plans. This is a business in which no iron clad rules can be laid down to be governed by, we must be governed by the weather and a hundred other variable circumstances. A carnation to make a real good plant should be planted out not later than May 15th. It being already a little late, extra care should be taken in planting. The ground should be freshly plowed and the plants put in just preceding a rain. Our weather statistics are near enough correct for us to tell when that will be. By using freshly plowed ground you will have a nice damp soil to plant in, and to make assurance doubly sure you should not rush the plants in carelessly, as is sometimes done to get to another job. Carnations are no longer a secondary flower and they should not be given secondary treatment. Plant them carefully and firm the soil well around the plants. If the rain does not come on schedule time go along and tramp them in carefully before they get a chance to dry out too much.

Under no circumstances put a plant out dry; if you are planting in nice moist soil have the plants nice and moist and if the soil should happen to be very dry have your plants quite wet, the excess of moisture on them will then moisten the soil immediately around the roots sufficiently to carry them for quite a while without rain. My policy always has been to plant out, as stated, immediately before a rain, no matter how dry the soil might be. It is a pretty safe rule to not water them in the field; of course there are occasional exceptions, but they should be actually suffering for water before it is given them in the field and then they should be watered very heavy; it is a mistake to put a little water on the surface, which does more injury than good.

Another safe rule to follow is to allow no careless or new employee to plant out your carnations. There are three periods in a carnation's life that should have the best of attention to make a success of them; first to get a good cutting, second to get them started nicely in the field, and third to get them started nicely in the house; all of these done well by men who know how to do it and you are on a fair road to success; done carelessly and you are on the road to failure.

Most of us are working men and I find it a good plan to work right along with my men when planting out and show them by example how to do it and see that they do it as good as myself or get out of the patch; there are no half way measures allowable in so important a job. ALBERT M. HERR.

A Word for the Bench.

In the FLORIST of April 19th Mr. Herr gives the cold shoulder to the bench system of growing carnations. My experience being strongly in favor of benches, I would like to testify in their behalf, for the benefit perhaps of the man who is still "on the fence" in the matter of beds vs. benches. Right here I will say, if you have a light, sandy soil, then the soil—solid bed—will no doubt fill the bill to the best advantage. If you are favored with a good strong loam (that will cut two or more tons of timothy to the acre) then I believe that four or five inches of such soil, coupled with *liberal* feeding in the shape of fine old manure applied as top dressing, will give a better average in quantity, quality, and net cash results than can be obtained by growing in solid beds.

In advocating the bench, I do not lose sight of the fact that some varieties of carnations will do better in beds than benches; perhaps the strong growing kinds, although in my bench of Hectors—measured this day—I have hundreds of blooms that can be cut with 2½ to 3 ft. stems.

I opine Mr. Herr will readily admit that, given a strong soil, the bench system has the call from Nov. 1st to May 1st. Now then, from May 1st on, let us see if we can make a good showing. Referring to my sales account for June, 1893, I find 400 F. Mangold plants gave me 4,225 long blooms, 1,060 short, this after continuous cutting from October 10, 1892. At this date, April 25, 1894, my house, 100x20, containing 2,200 mixed plants (benches all) is in very fine condition, and promises 25% better average than I got last year. My preparation for business is:

Sods cut and piled in early spring, mixed with one-third fine horse manure; kept wet to rot; turned over in August. Before placing in bench I like to put on bench bottom 1 inch of coarse manure. In the matter of top dressing I apply from 1st to middle of January one-half to one inch *very fine* horse manure; and again in March.

The above method has thus far been satisfactory to me. E. G. BRIDGE.

Woburn, Mass.

CRESCENT WREATH OF ROSES, CATTLEYAS AND LILY OF THE VALLEY SENT TO THE FUNERAL OF THE LATE MYRON A. HUNT BY THE CHICAGO FLORIST CLUB.

Carnation Edna Craig.

We mail to-day a photograph of a bed of Edna Craig carnations, the variety that has proven disappointing to so many growers this season. Among all the varieties that we are growing this one has proven the most satisfactory both in freedom of bloom, health, and selling qualities. This picture was taken when the crop was slightly past its prime, and does not show the crop at its very best. We have cut three such crops as this one, during the season, the color running very regular in all of them.

THE HIGHLAND FLORAL CO.
H. M. Altick, Sec'y. and Treas.
Dayton, O.

[The photo showed a bench of plants in good crop. The success mentioned is simply additional evidence of the now well established fact that a variety may do finely at one place and still be worthless at others. The soil and conditions supplied by our correspondent have evidently met the needs of this carnation and success has followed. Edna Craig was full of promise when introduced. But the fact that it has since "petered out," in the soil of the introducer, under the same conditions that contributed to its first success would indicate that the variety is decidedly unreliable.—ED.]

Coleus New and Old.

LOOKING FORWARD AND BACKWARD.

I am reminded by reading an article very recently on the carnation how very much you can look backwards and forwards at the wonderful genus of which the coleus is our most familiar acquaintance. Tacitus, the Roman historian, informs us that on his visit to Great Britain, A. D. 49, he found a species of this plant, which annoyed him very much by stinging his bare legs when walking through the thickets of that barbarous country. It was then he made use of that immortal couplet "Cosmopolite idiosyncrasy supersensitiveness," which boiled down into modern Anglo-Saxon means "you darned stinging creature." The peculiar idiosyncrasy of this plant was its fluctuating environment. You never knew when you were encroaching on the sanctity of his environment until you felt his sting. Eighteen centuries passed and notwithstanding the royal blood of a past dynasty it has never improved, it is not even an "Ultima Thule" to please the esthetical cosmopolitan of this comparatively enlightened age. From many thousand miles away a plant was introduced some 50 years ago and this is the parent of all our glorious many colored coleus. By the natural law of evolution and the work of man and artificial selection they attained a few years ago the zenith of their popularity, the blotches and stripes and various shades of their coloring and still unfolding possibilities bidding us looking forward in the hope that we may some day possess a coleus embodying all the defiantly beautiful, bewitchingly impressive, evolving betterments, flashing colors, deserving the salvos of all future generations in the mighty to come, possessing the constitution that will resist from the cradle of infancy the tendency not to deteriorate under the unavoidable modified diversified environment existing in the coleus belt; in fact inheriting such sexual ancestral forces with such a focalized occult force of heredity that it won't be troubled with mealy bug. W. S.

American Seedling Roses.

We are glad to learn that Mr. Fred. Dorner, La Fayette, Ind., has taken up the rose and now has many crossed flow-

ers setting seed. Mr. Elmer D. Smith, Adrian, Mich., is also raising seedling roses, and Mr. E. G. Hill has a large number of seedlings coming on. In the greenhouses of the late M. A. Hunt are several plants bearing seed, the flowers of which have been crossed. One hep on a Kaiserin crossed with American Beauty was very full and will soon be ripe. He had also crossed the Kaiserin with Jacqueminot. There are probably others at work and we may soon expect to hear of numerous American grown seedlings of promise.

Hardy Flowers for May.

I don't know how it may be with you on the prairies, but here at the East there is a very large and growing proportion of people who have a hankering after the good, old fashioned border flowers. That they are still more likely to be in demand is I think very likely. If florists, cottagers, and amateurs can but be led to aim for special seasonal displays of such plants, rather than the hap-hazard and promiscuous arrangements commonly seen, they will be able to point with more pride to their achievements. As a small contribution to this end I give you a list of a few of the spring blooming plants, both in small shrubs and herbaceous plants, which if only brought together in any one place will be absolutely sure to make a sensation—strong in proportion to the taste displayed in their disposition and blending.

Just here I wish to say a word to the ladies; I want them to do some little missionary work, and as but few of them read the FLORIST, I want the florists to urge it upon them.

I am down upon the practices of the unskilled laborers, black, white, and yellow, who pose as jobbing gardeners. These poor vandals absolutely ruin nine-tenths of the spring flowering shrubs all over North America. They start in with a garden shears at the close of winter and modishly, sheepishly, follow each other, and vie with each other in "trimming" them, and robbing them of their flowering wood, and every vestige of grace and material expression. One of the great railway corporations (I depart from my usual practice and name it, for it hasn't a soul to harrow!), the Pennsylvania, is a prominent leader in this barbaric work. I wish I could get at the President; I would try and discover if he knew any single thing on earth about other betterments than railway betterments, and if he would apply it to the shrub-butchers all along his system. Maybe some of your readers know him, if so, do please beg of him to issue a simple order to his "Shearers" forbidding them to touch the shrubs *until after flowering*, excepting the altheas and hydrangeas. Simple thinning of old and dead wood, and gross straggling growths, is all most shrubs require. Don't forget it, for I have known these men work themselves and their abominable practices into positions which are pointed to as "patterns" for the community; a tendency only too common if ten cents can be made by the laudation.

By far the greater portion of the taste and progress of American gardening must depend upon the florists and the ladies, and they should apply themselves in unison to the correction of a manifest evil—and that immediately.

With the larger shrubs thinned and getting a living show, the following list may be used to embellish many and many a garden and render it a perennial and characteristic pleasure. The florist himself, if he will set the pace, can often make more from garden than from greenhouse plants or I am much mistaken.

DECAY OF CALLA

Among small shrubs worthy his attention are Berberis aquifolia, Daphne Cneorum, Prunus Japonica, Rhodora canadensis, Rhododendron (Azalea) amœna, Early Gem, etc., Spiræa Thunbergi, Xanthoceras sorbifolia.

And of herbaceous plants: Adonis vernalis, Alyssum saxatile, Aubretia olympica, etc., aquilegias, Anemone pulsatilla, etc., Centaurea nigra variegata, Dicentra canadensis, eximia and spectabilis, Doronicum caucasicum, erythroniums, fritillarias, Iberis sempervirens, etc., Lamium maculatum, L. m. album, Leucojum vernum, Mertensia virginica, myosotis, Muscari botryoides, M. b. alba, azurea, etc., narcissus, Potentilla verna, Pulmonaria cærulea, Phlox subulata vars., divaricata, perfoliata, stellaris; Polemonium cæruleum, variegata; Senecio aurea, Saponaria ocymoides, Silene Pennsylvanica, Thalictrum dioica, trilliums, Trollius Japonicus, etc, tulips in great var., Viola pedata and others.

This is but a very partial selection, but I venture the assertion that there is not a single florist in all North America who can write to you and say that he has any considerable portion of them arranged and growing in such a way as to be attractive to customers, and I hope they will not be offended if I say to them that I think that is *just where* they *miss it*.

Trenton, N. J. JAMES McPHERSON.

Decay of Callas.

The calla is usually comparatively free from fungous diseases. However in December last specimens were sent from St. Louis, Mo., with the statement that the plants had been imported from California, apparently in perfect health, grew luxuriantly, but shortly after blooming decay set in, and the whole lot of a hundred quickly perished. Other roots from the same lot, but planted elsewhere, behaved in the same manner. Since then complaints have come from other localities of a similar rotting. The decay began at the top of the corm and in the insertion of the leaves at the crown. The engraving made from a photograph of a longitudinal section of one of the diseased specimens, shows in its central darker portion the area of the decay.

The only sufficient cause of the trouble is microbes which were found in great abundance in the disorganized plants which gave off an offensive odor. The individual germs were ellipsoidal, from ⅔ by 1½ micromillimeters in size and members of the genus Bacterium.

An interesting point in connection with the Missouri outbreak of calla disease was that other plants grown under similar circumstances, but not from California, have thus far escaped, while those of the same importation and grown at widely separated places have been similarly affected.

It is possible that the plants were all affected at the outset with the bacterial germs or else there was some other primary cause of the disease or predisposing condition that obtained before the importation was divided up among the several growers.

As a remedial suggestion owing to the fact that the somewhat ligneous corm, below its succulent tip, does not give way readily to the bacteria, it is possible that the plant may be saved by cutting off the diseased upper portion and permitting new suckers to form that may escape the decay. BYRON D. HALSTED.

Rutgers College.

Trees for City Use.

ED. AM. FLORIST: I was much interested in Mr. Meehan's article on "Trees for city use" in your issue of March 29. One seldom sees such good sense expressed regarding the planting and pruning of street trees, and it is hoped the article may have still wider publicity. The list recommended is certainly an excellent one and the suggestions regarding the management of street trees by the municipality is one that all lovers of the beautiful would like to see adopted. It has occured to me, however, that for smaller towns—say cities of seventy-five thousand population or less, a few additions could be made to the list. One misses the elm and the box elder particularly. Neither of these species does well in smoky cities, but both succeed in large towns, and nothing can surpass the American elm as an avenue tree. Even in towns of large size the elm does well. Fine specimens are growing in Rice Park, in the heart of St. Paul, and if I remember rightly, large elms stand in the little park in Cleveland where the Perry monument is. The elm and box elder are fine for village planting. There is a row of box elders, two blocks long, in one town that are model street trees, giving a shade not too dense for glints of sunshine to penetrate, and yet sufficient for the pleasure of the passer by.

Our American sycamore can be made as useful a street tree as the European plane,

BUNCH OF UNCLE JOHN CARNATIONS AND ASPARAGUS PLUMOSUS SENT TO THE FUNERAL OF THE LATE MYRON A HUNT BY MR FRED DORNER. LAFAYETTE, IND.

if subjected to the summer pruning that Mr. Meehan recommends.

If the trees are set inside the lot line, as happens in many towns, the hackberry and the thornless honey locust may be added to the list. The hackberry is one of our prettiest native species, and the locust—I do not know whether the thornless trees constitute a separate species or not—casts the most beautiful shadow of any tree that grows. C. A. KEFFER.

Columbia, Mo., April 4, 1894.

Philodendrons.

ED. AM. FLORIST: Kindly give me advice as to proper treatment of the philodendron—heat, water, etc., and method of propagation. Can they be grown from the long runner-like roots that grow from base of petiole? BARNES.

Philodendrons are stove arads, and luxuriate in a moist heat of 70 to 75 degrees. They require shading from direct sunshine at all seasons, though the well known P. pertusum will endure partial exposure, and is frequently used for outdoor decoration in the summer.

An abundance of water is needed for these plants, and the soil should be a loose compost of equal proportions of loam and peat, to which may be added some sand and chopped sphagnum moss—the pots being also well drained.

Propagation cannot be effected from sections of the roots, but the stems may be cut into short lengths (to include at least one joint) and partially buried in a mixture of chopped moss and sand, or in cocoa fibre, and if placed in good bottom heat will soon start into growth.

W. H. T.

Counting Lily Blooms on the Plants.

It is said that the Yankee way of answering a question is to ask another. Regarding the above subject on which an article appeared in the FLORIST two weeks ago I should like to inquire whether the Easter lily bud is any more of a flower than a calla bud is a flower? If I buy roses or carnations and they have several buds on them they are not counted as flowers; why should lilies? At Easter time Harrisii lilies are quoted wholesale at 12 cents each; I offer them at retail for 20 cents and then order five hundred. When they come there are but 300 lilies including large buds that would open in two or three days; the rest are small hard buds that might flower a week later and then bring three or four cents. Five hundred bought at 12 cents would be $60; three hundred sold at 20 cents would be $60; where do I get my profit?

I also wish to inquire whether any one can give a good reason why stale roses and carnations should be paid for at the same price as fresh ones, or carnations that are burst at the same price as those that are perfect? INQUIRER.

The One Judge System.

Mr. Ewing wishes to know why I alluded to the one judge system as un-American in principle. The best explanation I can give is that advanced in the paper to which Mr. Ewing refers, namely; that the one judge system is un-American in principle because it places too much responsibility on one individual.

With all respect to Mr. Ewing I must say that I can see no similarity between the position of a judge at an exhibition and that of the President of the United States. Still these things may appear differently when seen through Canadian eyes.

Toronto, I believe, is the place where according to our friend Ewing, they object to three judges because "one does not know who to kick," and because "two duffers can over-rule one man who does know his business." I am not quite sure on the definition of the word "duffer" but presume that from a defeated exhibitor's standpoint the duffer is the man who voted to give the prize to somebody else.

It is pleasant to know that our Toronto brethren have found a system which works well and gives them satisfaction, and this being the case they would be unwise to make any change. Still I am inclined to believe that but a very small proportion of those interested in exhibitions either in American or Europe would be willing to adopt the Toronto plan even with the satisfaction thrown in of knowing "who to kick." That the wisdom of one man is greater than the combined wisdom of several is a proposition which Mr. Ewing will find difficulty in proving to the general satisfaction.

WM. J. STEWART.

Blunders in the Mail Service.

As a remarkable example of the curious errors occasionally made by the mail service Mr. H. E. Chitty sends us three letters which he received from the dead letter office April 20. One of these letters was written and mailed by himself on Dec. 17, 1889, and the envelope that enclosed same was so plainly addressed to Mr. John McGowan, Orange, N. J., that a mistake would seem impossible. The envelope bears the Paterson, N. J., postmark, of Dec. 17, 1889, 5 p. m., and has stamped on its face the legend: "Improperly held by late postmaster." On the reverse appears the postmark of Florida, N. Y., also under date of Dec. 17, 1889. It seems never to have reached Orange, N. J., and as above stated it was returned to Mr. Chitty from the dead letter office April 20, 1894, four years and four months after being mailed. But most curious of all Mr. Chitty received with his own returned letter two others addressed to Mr. Mc-

Gowan, one written by Mr. John Thorpe, at Pearl River, N. Y., under date of Dec. 2, 1889, and the other written by Mr. J. N. May, Summit, N. J., under date of Dec. 6, 1889. All of these letters were of a similar tenor, all acknowledging the receipt of flowers of the Lizzie McGowan carnation, then a novelty.

As Mr. McGowan was then, as now, at the address that appears on the returned envelope, the failure to deliver was an incomprehensible blunder. And by what process of reasoning the bright intellect in charge of such matters at the dead letter office decided that the proper thing to do was to send to Mr. Chitty the letters written by Messrs. May and Thorpe will surely remain a mystery to all ordinary mortals. It would seem that in these cases the service had taken great pains to hunt out a wrong way when the right one would have been much the easiest. And judging from this example of its work the dead letter office at Washington must be in charge of a nearly dead man.

Hyacinths and Tulips.

Recent changes in fashion and fancy have borne heavily on these once popular flowers and the demand for them as cut blooms is now but a small fraction of what it was only a few years ago. There is a good market for them yet however as plants, if well grown and placed before the public in attractive shape.

Our illustrations are from prize winning pans of ten bulbs each as exhibited at the Spring Show of the Massachusetts Horticultural Society. The hyacinths were grown by W. J. Martin and the tulips by Chas. J. Dawson. Massed in this way one variety in a pan they make desirable window decorations and give a big show for little money. Large quantities of these pans are disposed of in the Boston and New York markets throughout the winter and spring. Fitted into pretty celluloid baskets or other receptacles and encircled by ribbon of appropriate color they are great favorites in New York city as Easter gifts.

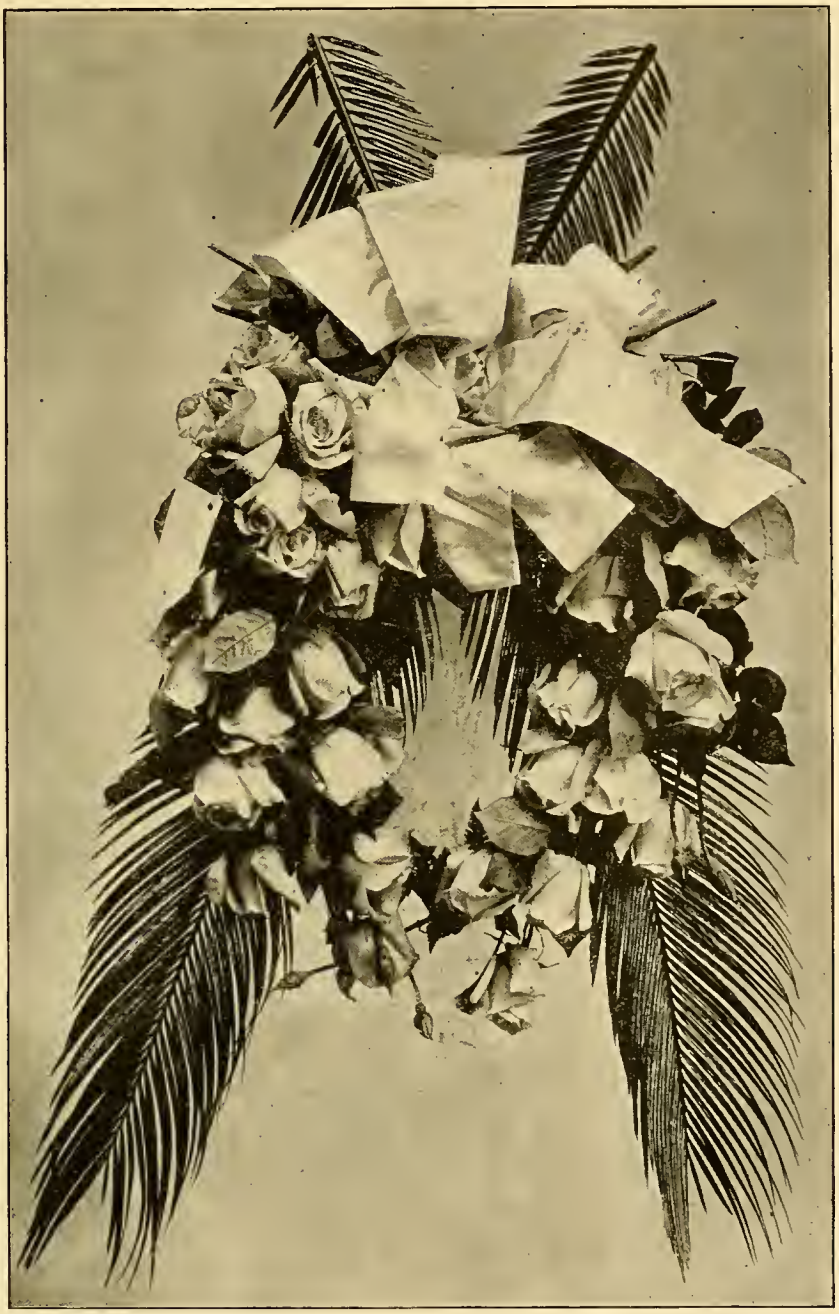
PAN OF LORD DERBY HYACINTHS

PAN OF WELL-GROWN KAISER KROON TULIPS.

Foreign Notes.

A recent writer in the *London Garden* speaking of violet Lady H. Campbell, says it favors the old Neapolitan in general appearance, and is not far behind in appearance. Its chief recommendation to him is its lateness, and it is much hardier than Neapolitan.

The April issue of the *Revue de l' Horticulture Belge*, in an article on chrysanthemum nomenclature, calls attention to the difficulty in finding any one plant under the alphabetical arrangement adopted by the compilers of most lists, namely, the using of the first letter of the prefix, whatever it may be. This writer advocates the only common-sense plan, that of using the name itself instead of the title prefixed, the plan used in the revised lists in the Florists' Directory.



The National Horticultural Society of Paris has organized a horticultural congress. Several questions relative to forcing are to be under discussion, both of flowers and vegetables.

Maranta (Calathea) Fascinator is described as one of the most beautiful foliage plants of recent introduction. It belongs to the same group as M. Massangeana, is dwarf, the stalks and reverse of the leaves being reddish purple. The midrib is white, the other ribs rose, and the main part of the leaf deep green, with silvery markings down the center, the plant is a native of Brazil, and luxuriates under stove treatment.

Hippeastrum brachyandrum is a fine amaryllid introduced from Buenos Ayres, which has been flowered at Kew. It has erect leaves, and a scape bearing a solitary flower, rose shading to wine-color at the base. Another interesting bulbous plant of recent introduction is Gladiolus platyphyllus, imported by Max Leichtlin from Caffraria. The flower is a beautiful yellow, traversed by red veins.

A new hybrid zygopetalum, the result of crossing Z. intermedium and Z. Gautieri is Z. Perrenoudi, which is said to show the character of both parents. The petals and sepals are glaucous green marked with brown; the labellum, very large, is a beautiful violet tinged with indigo.

A new orchid has been creating quite a sensation at the establishment of Sander & Co., at St. Albans. This is Miltonopsis Bleui nobilis. The flowers are very large, measuring five inches in diameter, the

CROSSED PALM LEAVES BEARING GARLAND OF ROSES (ONE SIDE BRIDES AND THE OTHER BRIDESMAIDS) SENT TO THE FUNERAL OF THE LATE MYRON A. HUNT BY E WEINHOEBER & CO., CHICAGO.

color flesh white and rose pink with a blotch of cinnamon in the centre of the blossom. The plant carries sixteen blooms.

A new ornamental gourd, introduced from Uraguay, is Sicana atro-purpurea. The fruits are described as about five inches long, cylindric-clavate, pale claret color, with a strong apple perfume. It seems probable that this would be a striking object for cultivation in our country.

One of the many interesting things in connection with bulb growing in Holland is the spring flower show which forms a feature at most of the large establishments. The show beds are planted with the newest and most remarkable varieties, a tent being placed over them during the flowering period. It is said that in consequence of the extremely favorable season of 1893 the hyacinths will be unusually showy this year.

At a meeting of the Royal Horticultural Society in March last Monsieur Maurice de Vilmorin of Paris presented an essay on the rare trees and shrubs in the Arnold Arboretum. The essayist spoke in high praise of the many rare species growing finely at this place, and of their arrangement. He was surprised to see the stuartias flourishing there, as they do not grow well in France, the same with Styrax Japonica. In the discussion that followed the reading of the essay Mr. Geo. Nicholson alluded to his recent visit to this country.

YOU CAN'T AFFORD to do business without a copy of our trade directory and reference book.

New York.

The market continues overstocked with flowers of all kinds excepting carnations, and the glut is further heightened by the receipt of early blooming outdoor stock. The prevailing warm weather is not conducive to the production of first-class flowers and much of the stuff coming in looks as though suffering considerably from "that tired feeling." White carnations and smilax alone are giving those who need them a chance to do a little hunting.

Ernst Asmus has come to the conclusion that the new system of growing roses in beds with the hot water pipes running underneath is of no advantage to him. He fixed up four houses in this way as an experiment last fall. He finds that they do not pay for the extra work of preparing and the cost of extra heating and will change them back to the old fashioned benches.

The only variety showing a marked improvement under the new conditions was Meteor. He found that Bridesmaids threw more flowers but that they were smaller in size. Speaking of Madame Testout he says that his faith in that rose has been greatly strengthened by his experience with it the past winter and he will grow more of it than ever next year. Brunners have been very handsome there this season. Captain Christy, of which he has been growing a small quantity, he proposes to discard; although the flower is handsome it is impossible to get good stems with it and hence it is not profitable to sell. The new rose Maman Cochet has so far proved useless with him, as he has been unable to get either buds or leaves on it, but he proposes to experiment further with this variety. Carnation Madame Diaz Albertini is looking very fine, the growth being extremely strong, and the flowers handsome.

A correspondent of the *Recorder* comes out with a warning to flower buyers against purchasing of the street fakirs, whom he characterizes as filthy and well calculated to spread smallpox and other contagious diseases. The retail dealers can do much toward checking the custom if they wish, by putting their prices down to correspond with the prevailing low wholesale rates. It is too generally the case that the public gets but little benefit of the low prices at which the growers have to let their stock go, unless they buy elsewhere than in the regular stores.

C. F. Wenderoth, of Avenue C, has been closed out.

August Millang, formerly Hanft & Millang, has given up his store on Sixth Ave.

Millang Bros. will soon give up their store on 28th street and make their permanent headquarters at the 34th street market.

Neal, of unsavory reputation in Washington, Chicago and elsewhere, is reported as about to start in business in New York once more.

Philadelphia.

Pennsylvania Arbor Day, April 27, was very generally observed in this city, and many trees were planted in the public parks. They are mostly dedicated to the memory of Philadelphia's distinguished citizens who have passed away; among those honored were Mr. G. W. Childs and Mr. A. J. Drexel. At Wootton, Mr. Childs' country seat, it had been his custom to have his distinguished visitors plant a tree and the lawn there is now graced with many fine specimens planted by some of the world's celebrities.

There is nothing new in regard to Hor-

ticultural Hall, although we are assured that everything is progressing smoothly and that before long final action will be taken and the work of rebuilding commenced.

Flowers are now abundant; there is plenty of almost everything except good hybrids, and as Beauties are now very fine their loss is not felt. J. W. Colflesh has a fine house of Jacqs; as he is the only grower of this rose in any quantity he has a ready sale, and at good prices, for all his stock, the best bringing $15 per hundred. Brides, Mermets and Bridesmaids, are still very fine. Heacock is sending in fine Bridesmaids, Evans also has good flowers. This rose will be planted quite largely about here the coming season, Robert Craig has sent in some very good Mme. Testout, which he has had no difficulty in finding a market for. We hear of several growers who will give the Testout another trial.

Except for a few daffodils from Newport and some outside tulips bulbous flowers are done for the season. Valley is in good demand, the price being $3 to $4 per hundred. Hostetter of Germantown still has some violets; they are really fine for the season. Sweet peas are very abundant, selling at from 1 to 1.50 per hundred; at these figures they seem to go very well.

For roses prices are about the same as last week, but with a drooping tendency. Carnations are to be had in quantity, but anything worth having still commands 1.50, while the fancies bring $2 and $3 per hundred. Murray of Atco, N. J., is sending in very fine long stemmed McGowans. There is quite a demand for yellow daisies, which sell readily for 2 per hundred. Harrisii lilies and callas bring $6 to $8 per hundred; smilax is scarce at 15 to 25.

The seedsmen are all now very busy and report trade above their expectations. Harry Michell had a narrow escape from fire a short time ago; the third story of his building he lets out to a fancy sign painter and fire breaking out in this room threatened destruction to the entire building, fortunately in answer to the alarm, a chemical engine was first to put in an appearance and confined the fire to this room, extinguishing it without damage by water, which would have been disastrous to Mr. Michell's stock. His store from cellar to roof is arranged in an admirable manner, and he certainly deserves the success he is having.

Mr. J. N. May was reported to have had a team of bowlers from Summit to meet the Phila. contingent last Thursday evening, but he did not put himself or his team in evidence, neither did some one else who was expected; however if he should make up his mind to bring a team he will not be sorry for it, for even if his team should not happen to be victorious they will not be able to say they did not have a good time, so say the Phila. boys.

The match series or trial games or contest from among the winners of which will be selected those who will represent the club in the contest at Atlantic City is to be started the first Thursday in May. The boys mean business this time, and every effort will be put forth to make the team a winner. K.

Acacias.

The cultivation of the acacia as a rule is not attended with any great difficulties, provided there is some attention paid to their requirements; attention they are entitled to, for they are all interesting, and quite a large number of the species, of which there are a great many, are exceedingly pretty and graceful when in flower.

ACACIA HETEROPHYLLA.

They will do admirably well in a cool greenhouse kept some few degrees above the freezing point. Some of them attain large proportions in a short period of time, while others are less vigorous; the latter therefore are more adapted for pot and small specimen culture. Amongst the latter are found the most graceful forms, such as pubescens, Drummondii, heterophylla, Riceana, cultriformis, and a host of others.

The slender twiggy varieties will strike root comparatively easy, Drummundii being one of the easiest that has come under my notice, pubescens being one of the most difficult. Indeed there are very few that succeed in rooting pubescens, though some claim that it is fairly easy to increase it from root cuttings, which mode I have not tried.

I find them to do well in a compost of fibrous loam, good leaf mould, and upland peat. The former equal to, or a little better, in quantity than the other two ingredients combined, with an additional portion of sharp clean sand. They require considerable pot room, and must not to any extent be confined in this direction, for they will soon resent it by showing a scraggy and stunted appearance.

It is hard to lay down recommendations as to the best and most graceful of them, each having a charm and grace of its own. Pubescens seems to take the cake with most people, especially with the ladies, and they know as a rule what is pretty and graceful. Its wavy and drooping habit is shown off to the best advantage on standards from five to eight feet in height. Drummundii, however, has a warm corner in my bosom, and deserves a place near the top of the class; its large yellow catkin-like flowers resting on deep green foliage makes it an object of great beauty. It is best in a pyramid form and requires little or no pruning. Heterophylla is a gem of the first water, its long and slender twigs clothed with numerous yellow flowers renders it an object of much grace. The flowering wood on this and similar kinds ought to be cut back considerably after flowering.

Acacia cultriformis is another beautiful variety, a more vigorous grower than any of the others mentioned, the color of the flowers being deep orange yellow. It is very distinct, the leaves being set on edge on the branches and peculiarly shaped, like the *coulter* of the plough, from whence it gets its name. It makes a fine standard; it requires to be pruned after flowering to within a few inches of the old wood.

Acacias are all benefited by use of stimulants occasionally, of a commercial sort, rather than the barnyard order. Most all of them do best planted out in a cool greenhouse, where such accommodations can be given them. The varieties above mentioned were selected for their good behavior and floriferous results in pots, to which selection a number of others could be added. KENNETH FINLAYSON.

Boston.

It is many months since prices were as low on roses, carnations and other cut flowers in Boston as they have been during the past week. Roses have suffered particularly in this respect, and there have been more of them coming in than the market, fakirs and all, could possibly

ACACIA DRUMMONDII.

consume. With carnations the trouble has been pretty well confined to the colored sorts. White carnations have sold fairly well but this cannot be said of any other kind. Puritan is one of the leading whites here among the late bloomers and is generally liked. It will be grown quite extensively for this market next season.

Outdoor daffodils will begin to come in in a day or two. This will finish what is left of the sale for indoor blooms which, however, cannot well be much worse off than they have been during the past week, a sample sale being the disposal of a lot of three dozen to a bootblack at the market in exchange for a "shine." Most of the violets now being received are the deep colored Cape Cod variety and this spoils the chances of the Marie Louise which is now of poor quality anyway. Sweet peas are getting more abundant and prices are lower. Smilax is quite scarce; if there was any special demand for it, it would bring a high figure.

Traveling men have been flocking to Boston in unusual numbers recently. There are now in the city Geo. Sykes, representing Hitchings & Co.; J. R. Frotheringham, for Lord & Burnham Co.; A. T. Boddington, for United States Nursery Co.; Martin Reukauf, for H. Bayersdorfer & Co.; A. Dimmock, for Sander & Co., and John Barclay, for John Gardiner & Co.

An enterprizing individual has brought from Florida a large shipment of tillandsias which he offers for sale in a temporary store, but although the plants are in good condition and prices very low, people do not appear to take much interest in the "Air Plant."

Chicago.

Moving day, May 1, has made a good many changes, particularly among the wholesale men. In the first place the Chicago Cut Flower Exchange has moved out of existence. The commission firms who occupied quarters on the floor of the Exchange have severally moved into their new homes. Corbrey & McKellar occupy a very pleasant suite of rooms at 64 and 66 Wabash avenue. Chas. McKellar is at present holding the fort at this establishment; he is trying in his usual way to mesmerize prospective customers with that sweet and winning smile pecularly his own. J. B. Deamud & Co. are now keeping company with Kennicott Bros. on the second floor of 34 and 36 Randolph street. Their rooms are pleasantly situated on the first half of the floor. Prince & Co. have taken a room at 42 Wabash avenue also on the second floor. The growers who occupied tables at the Exchange have formed a company and bought the assets of the Cut Flower Exchange, in the shape of furniture, etc., and will operate as "successors" to the old corporation. A room 50x34 has been rented at 59 Wabash avenue, second floor. The following have taken tables on the floor: The Niles Centre Floral Co., Geo. Klehm, Amling Bros., J. Tonner, Rockafellow, and H. Hansen. The Niles Centre Co. intends to carry on their shipping business as formerly, handling their own stock exclusively, as no regular commission business will be allowed under the new rules.

Complaint of poor business is universal. In retail circles nothing whatever seems to be doing. There is here and there a little funeral work, but nothing else of note. Transient trade is almost entirely monopolized by the street merchants, who fairly swarm in the down town district.

The market is in worse condition than ever. The extremely warm weather towards the end of last week rushed the crop forward at such a rapid gait that even with a good business it would have been difficult to dispose of it to advantage.

There is no settled price for anything. Nominally roses are held at $1.50 to $2, but in reality the bulk of the stock is sold for much less. Bridesmaid, Meteor, Jacque and Beauty are the only roses at all in demand and some sort of a price is obtained for them. Good Beauties bring from $12 to $20, Jacqs $8, Meteor and Bridesmaid $3 to $4.

Carnations have at last been carried down in the general slump. The best stock is sold at 75 cents, the bulk going at from 50 to 60 cents, and in large lots at even less.

In bulbous stock, valley has been scarce at $3. Tulips, daffs and Dutch hyacinths are coming in freely from the open ground but there is little demand for them. Tulips and daffs are quoted at $1, Dutch hyacinths at $2 to $3. The few violets sent in are sold readily at 75 cents. The sale for arbutus is almost entirely restricted to the street. The quality this year appears to be inferior to former seasons.

At the club meeting held Thursday the matter of providing new quarters came up for consideration. In the absence of President Hauswirth, who in company with G. L. Grant, J. C. Vaughan and J. T. Anthony, attended the funeral of M. A. Hunt, Mr. Edgar Sanders acted as chairman pro tem. No report being made from the trustees to whom this matter was delegated, action had to be deferred. Meanwhile the effects of the club will be taken care of by Geo. Klehm and temporarily stored at the quarters of the new exchange.

Action was taken on the sudden death of M. A. Hunt and the following resolutions were unanimously adopted:

WHEREAS, The Club has learned with profoundest sorrow of the death of Myron A. Hunt, an honorary member of this body, a man universally honored and highly respected by the entire profession of this continent, whose liberal, broad and advanced ideas and rigid integrity ranked the very highest in our midst, be it

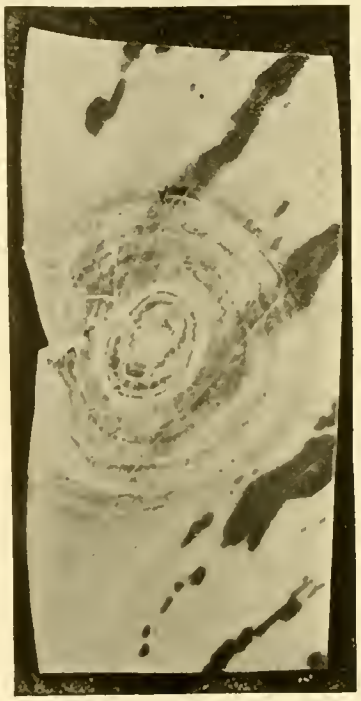
Resolved, that this Club extend their heartfelt sympathy to the members of the family of our late associate in this hour of their great affliction.

Resolved, that the secretary be instructed to forward a copy of this resolution to the family of the deceased.

E. H. Hunt has removed to 68 Lake St. The main floor of the new quarters will be devoted to the seed trade and florists' supplies. The second floor will accommodate the cut flower business of the firm.

H. F. Halle and wife will leave on an extended European trip about the first week in July.

The situation at Lincoln Park remains about the same. Superintendent Pettigrew has not yet been removed and acting on the advice of his friends he has not resigned. The latest effort toward retaining his services was made by the North Town Board who have made an urgent request—almost a demand—that he be not disturbed. As the Board is the body that makes the appropriations for the maintenance of the park its voice ought to carry some weight. But it is unlikely that anything can now stop the governor in his mad course. He undoubtedly realizes that nothing he may now do will remove the stigma of his actions up to this time, and probably does not care what further results follow. Even the practical politicians have deserted him, feeling probably that they could not afford to link themselves longer with the most unpopular man in the state. The governor is at present at Hot Springs, Ark., and on his return he will probably take official action, and few doubt that that action will be the summary removal of President Waller of the Board of Commissioners, and Superintendent Pettigrew. Mr. Waller has improved his time during the last few weeks in preparing statements of the affairs of the park in refutation of the silly charges made by the governor's henchmen. The daily press have given space to same but with deprecatory editorials, taking the stand that there was no call for a gentleman of his standing to defend himself against such silly charges from such dubious sources.



The tulips are now in splendid bloom at the park and everything is looking well.

Mr. Geo. Miller is preparing to rebuild his burned greenhouses at Hinsdale and expects to have every thing in shape again before a great while. He is convinced that the fire was incendiary. The barrel of gasoline near which the fire started was fully 25 feet away from any fire or light and every precaution had been taken in the use of the fluid. The gasoline was used to run a pumping engine. After the fire the iron faucet of the barrel was found, turned wide open. Mr. Miller believes that the incendiary turned the faucet open, allowed a considerable quantity to escape, and then dropped in a lighted cigar or match and ran. The gasoline must have been pretty well run out of the barrel as there was no explosion. The fire ran the length of the shed with frightful rapidity. Mr. Miller found the gasoline pumping engine very handy but will not have any more gasoline around his place with which to tempt fate, and will employ some other power in future.

Joe Curran at the telephone—"Hello! Say, what do you mean by charging me for 20 bunches of violets when there are only 19 by actual count?—Mistake? I counted them myself and give you my word that the mistake is on your side, and by the great horn spoon I expect you to make it right!—Of course! Did you think I was born yesterday?—Never mind, one bunch counts big the way business runs now.—Is that a joke?—All right I'll do my laughing after I close up to-night. Business is too solemn now to permit even a smile during business hours. Good bye."

Anthracnose of Dieffenbachias.

The successful growing of the dieffenbachias in their best estate is greatly retarded by an anthracnose, and in some places they have been given up. The plant sickens through and through, becomes feeble in leaf, the dwarfed foliage fails to develop the charming variegation characteristic of healthy plants, and finally the leaves become spotted, turn brown and die. The cause of this trouble is a fungus of the genus colletotrichum which by means of its microscopic filaments penetrates all parts of the plant, particularly the leaves. The blanched portions of the foliage are the least able to resist the inroads of the fungus, and are the first usually to show unmistakable signs of the presence of the parasite. Sometimes the disease starts at a point in the middle

ANTHRACNOSE OF DIEFFENBACHIAS.

of a leaf and spreads from there in all directions.

The engraving shows a portion of a leaf, the picture having been taken by direct printing by the sun upon the sensitized paper, and therefore true to life in its many details, the only point to be borne in mind being that the colors are largely reversed. Certain small specks may be seen in the diseased areas, and these are the places where the fungus has developed its masses of spores. By means of these spores, which germinate in a few hours the anthracnose is able to be spread to new plants. It is not known how wide a range this fungus has and it is possible that it grows upon other plants than the dieffenbachias. BYRON D. HALSTED.

Rutgers College.

St. Louis.

Warm weather appears to have commenced in earnest, and the expected result is shown in the improved market trade, which is much better than last week; the prices realized however, are considerably lower than in former seasons, buyers apparently being limited in regard to amount; shipping trade is also good, and is about holding its own with last season; the prices realized on this class of trade are about the same as in former years, owing to its being ordered from catalogues.

Quantities of cut flowers are being received as a result of the higher temperature, and there is a heavy loss in all kinds, there being very little demand; the best stock alone sells, it being impossible to give the poor stock away. There are fine specimens of all the varieties in season being received by the various commission men, but trade is nothing like what it should be; prices are merely nominal, the wholesalers being glad to get any price whatever. Beauties have been in fair demand but have suffered with the other stock.

A special meeting of the club was called on the 24th, to take some action in reference to the death of Mr. M. A. Hunt, the call was promptly responded to, and a set of resolutions drawn up and forwarded expressing the sorrow felt by members of the organization. A wreath was also forwarded by the club, and Mr. J. M. Jordan was sent on in person to represent the St. Louis Florist' Club and to show in a slight measure the respect and esteem in which our late fellow craftsman was held.

The beds in all the city parks have been ablaze the past two weeks with Dutch bulbs, this being especially noticeable in Forest Park, where large quantities of tulips have been used the past season; the show has been worth seeing and everyone visiting the parks has left delighted with the display.

Quite a novelty was noted in the city during the past month; it consisted of a show window in one of the large down town stores arranged to represent a bit of nature; the floor was nicely sodded, and all through the sod were various varieties of wild flowers in bloom. The idea was well carried out in the surroundings, and the execution of the details was well attended to. R. F. T.

Catalogues Received.

Wm. Preer, Columbus, Ga., chrysanthemums; Newport Nursery Co., ornamental trees, shrubs and plants; same, hardy herbaceous plants; C. J. Speelman & Sons, Sassenheim, Holland, bulbs; Williams & Sons Co., Batavia, Ill., plants; same, tree and plant labels; K. G. Dekker, Chicago, plants and nursery stock; F. Sander & Co., St. Albans, England, new and rare plants; Wm. Cuthush & Son, Highgate Nurseries, London, Eng., nursery stock; Chas. Vuylsteke, Loochristi, Ghent, Belgium, palms, azaleas, etc.; W. J. Hesser, Plattsmouth, Neb., decorative plants; H. F. Michell, Philadelphia, bulbs and seeds; James Veitch & Sons, Chelsea, England, plants; Jules De Cock, Ledeberg-Ghent, Belgium, plants; I. L. Pillsbury, Macomb, Ill., plants.

Crude Oil for Fuel.

Replying to R. E. Moir, crude oil could be shipped to Massachusetts for fuel and save money over coal if properly handled. It should be shipped in tank cars and to store a car load a large storage tank would be necessary. To compare cost of coal and oil for fuel purposes figure 125 gallons of oil as equivalent to a ton of coal. If Mr. Moir will write me I will give details of the burner I use.

Woodmere, Mich. GUS. KNOCH.

WHEN writing our advertisers please use one of your printed business letter heads or enclose your business card.

News Notes.

ROCHESTER, N. Y.—Chas. Barthold has started in the nursery business here this spring.

POTTSTOWN, PA.—Edwin Wickersham & Co. are adding a rose house 18x100 and a violet house 10x30.

TACOMA, WASH.—William Russell, formerly of Ford River, Mich., has located here and will start in business.

NEWBURG, N. Y.—Henry Carter, a florist of this city, made an assignment to Leander Brown on April 21.

GLENDALE, MASS.—Diehl & Towle, Meadowside Conservatories, is the name of a new florist firm just started here.

WESTERLY, R. I.—The Botanical Society has received several hundred specimens from C. H. Dennison of Brooklyn, N. Y.

SIBLEY, ILL.—C. Hokanson has taken charge of the Burr Oaks Greenhouses and will make a specialty of violets and pansies.

NEW HAVEN, CONN.—Geo. A. Dickerman, of 619 Chapel street, made a voluntary assignment on April 20. Fred Betts is named as trustee.

MINNEAPOLIS, MINN. — William Rath, for some time with E. Nagel & Co., has now taken a similar position with J. B. Heiss, Dayton, Ohio.

COATESVILLE, PA.—James Brown, Jr., has secured a site for a greenhouse plant and will begin at once the building of three houses 16x100 each.

RIDGEWOOD, N. J.—The Thurston greenhouses and nurseries have been purchased by Messrs. Thompson and Hampson of Paterson, who will continue the business.

ELMIRA, N. Y.—Mr. Grove P. Rawson, who has passed the greater part of the winter in the tropics, arrived home on April 16, having had a long and tempestuous voyage.

HELENA, MONT.—Mrs. Mattie Miller, the florist, has a seedling fuchsia, 3 years old, which is 5 feet in height, 18 feet around the top and 6½ inches around the stem at the surface of the soil.

CLIFTONDALE, MASS.—A thief broke into the office of David Allan and stole some books and other articles on the night of April 18. Among the books taken was the American Florist Co.'s Directory. That thief knew what was good.

NEW BEDFORD, MASS.—The premium lists for the seventh annual Chrysanthemum Exhibition of the New Bedford Gardeners' and Florists' Club have been completed. Schedules and entry blanks may be obtained from the secretary.

NEWPORT, R. I.—The Newport Horticultural Society's fifth annual chrysanthemum show will be held at Masonic Hall on Nov. 6, 7, 8. Schedule of premiums may be obtained from the secretary, Mr. Alex MacLellan, Ruggles Ave., Newport.

TACOMA, WASH.—The Tacoma Amateur Rose Club has been organized with officers as follows: P. V. Cæsar, Pres.; Mrs. L. P. Bradley, Vice Pres.; J. M. Winslow, Sec'y. A constitution has been adopted and meetings will be held the first Wednesday of each month to discuss the cultivation of roses and other flowering plants.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—As rose grower, or general florist: lately employed by Dingee & Conard Co.
G. F. LONGSDON, 844 W. Lake St., Chicago.

SITUATION WANTED—By young woman to learn general greenhouse work; Wisconsin or neighboring states preferred. Address
MISS MIRIAM JEWETT, Sparta, Wis.

SITUATION WANTED—By first-class florist with life experience; age 32; able to take full charge of commercial or private place. Address
N M, care American Florist, Chicago.

SITUATION WANTED—As foreman for commercial place; well up in roses and general plants; 18 years' experience; can handle men; good references. Address W S, care American Florist.

SITUATION WANTED—By young single man; 5 years experience in growing roses carnations, violets and general stock; commercial or private; references. P P, care American Florist.

SITUATION WANTED—As second gardener in a private establishment, or as general nursery hand; good experience in all branches; English, age 27, single, abstainer. F. HILL, W. Porter St., Oswego, N. Y.

SITUATION WANTED—By a florist, 28 years of age; good propagator, grower and forcer of roses; is competent to take full charge of growing cut flowers and plants. Address G. KROITOR,
care A. Dittrich, Kensington Sta., Philadelphia.

SITUATION WANTED—As working foreman on commercial place, well up in growing roses, carnations and general florist stock; age 37, married. Good references. State wages. Address
J R, care American Florist, Chicago.

SITUATION WANTED—By single young man as first-class florist and salesman; ten years' experience in New York stores; willing to go any distance from New York; best reference. Address
FLORIST, 68 W. 43d St., New York City.

SITUATION WANTED—By first-class designer, also willing to make himself useful in greenhouse if necessary; single man of 30; first-class references. Will work for moderate salary if steady place. Address C W, care American Florist.

SITUATION WANTED—As manager or foreman; thoroughly versed in growing cut flowers and plants; has lived in some of the leading places in England and this country; over 20 years' experience; good references. When applying give particulars.
FLORIST, 129 N. Clark St., Chicago.

SITUATION WANTED—By a practical Scandinavian, 18 years' experience, married, as a working foreman or gardener in commercial or private place; thoroughly understands all branches of the trade; highest references; state wages; west preferred. Address PRACTICAL, care American Florist.

SITUATION WANTED—By a good florist and gardener in a commercial or private place; thoroughly competent to manage place, in forcing roses, carnations, bulbs and general florist stock; German, single, 27 years of age; good references from former employers. Address F. C. R., care Lakewood Greenhouses, Minneapolis, Minn.

Cash with order or C. O. D.
JAMES CHALK, Norristown, Pa.

ROSE GROWER WANTED

WANTED—A thoroughly competent man to take a position as foreman in a first-lass establishment within a few hundred miles of Chicago. Must be a man who can grow roses and carnations of the very best quality. Must be temperate, thoroughly experienced and reliable. The best of references required from reliable growers. This will be a good and permanent position to a good man. Any such who would make a change within the next few months will do well to correspond with us. Address
"LA FRANCE," care Am. Florist.

Splendid Business Opportunity

The widow of the late Robert J. Purvis, being unable to continue the business, will sell at a low price the stock of 35,000 plants, tools, etc., used in the business of her late husband. Everything in first-class condition. The six greenhouses can be leased for a term of years at a low rate. A splendid opportunity for an energetic young man with some capital. Address
MRS. R. J. PURVIS,
EDGEWATER, CHICAGO, ILL.

A RARE CHANCE FOR INVESTMENT

FOR SALE.

Columbia Farm, containing over 20 acres arable and grazing land, climate one of the finest in the world. Frost and malaria unknown. Lilies, narcissus and amaryllis grown in open ground throughout the winter. Enough Harrisii and other Bulbs will be furnished to stock the farm, so that new proprietor can enter at once into business, which should be started not later than August next. Our Harrisii Bulbs have a world wide reputation, and a good practical manager can secure handsome profits. Sold because other business claims my attention. Communicate with
R. H. JAMES, Proprietor, St. Georges, Bermuda.

NOTICE.

Chicago Flower Exchange.

At a special meeting of the Stockholders of the Chicago Cut Flower Exchange, held at No. 45 Lake Street, Saturday morning, April 28th, it was resolved to discontinue the business. All persons having claims against the Chicago Cut Flower Exchange are requested to present same at once, and those indebted to said Exchange are requested to make payment without delay to
GEO. KLEHM, Sec'y,

Price $2.00.

AMERICAN FLORIST CO.,
CHICAGO.

Cincinnati.

Very few of our florists are suffering this week, in fact they are very well pleased with the trade they are having. Huntsman & Hardesty had the decorations for the Brud—Rhodes wedding, which was a very fashionable one, and L. H. Kvrk & Co. made the bride's and bridesmaids' bouquets.

A foreign society paper states that the daffodil is quite the thing in England and as America apes after the English to a certain extent, daffodils ought to be good stock to have for next Christmas and New Year's.

J. A. Peterson is building two new houses, one for violets, the other for propagating.

Peter Herb is having a good sale of rooted cuttings of Adelaide Kresken carnation.

A few handsome blooms of yellow mums were received recently from E. G. Hill & Co., Richmond, Ind. They met with ready sale.

Stock in general is good and prices remain a little firmer this week. White stock of all kinds is quite scarce, especially carnations and Brides. American Beauty is more plentiful and sells readily at 25 for good flowers.

H. L. Sunderbruch has returned from a few days fishing and hunting at St. Mary's. "Did not see any fish or ducks."

The announcement of the death of Myron A. Hunt was a great surprise here. Much sorrow is expressed as he was held in high esteem by all who knew him. E. G. GILLETT.

"BRICK" is the title of a new trade paper devoted to the interests of the brick-making industry, published by Windsor & Kenfield, Chicago, who also issue that handsome publication, the *Street Railway Review*. The title is certainly a model of brevity, and is at the same time fully descriptive of the industry represented. We are always in sympathy with true brevity—that which says much in few words—and "Brick" will make no mistake in keeping its contents in line with its title.

YOU CAN never invest $2 to better advantage than in a copy of our trade directory and reference book.

Chrysanthemums.

Now is the time for benching or prize growing. Buy no rubbish, but freshen your stock with the very finest novelties and extra large flowering varieties, all suitable for cut bloom, at prices lower than old played-out kinds are offered by others. STRONG, HEALTHY PLANTS, NO ROOTED CUTTINGS; 100 plants, 20 kinds 5 of each, $4.00, post free $4.50, or 100, all different, my selection, at same prices.

A. Starnes (yellow),	J. Hill (dark),
M. A. Wheeler (yellow),	Niveus (white),
Pres. Smith (pink),	A. T. Ewing (pink),
A. Wood (dark),	G. R. Gause (bronze),
J. Williams (white)	L. Mennad (dark),
M. Sievers (yellow),	J. G. Whilldin (yellow),
Kate Brown (white),	Mrs. J. Jones (white),
Black Beauty (dark),	Col. Smith (bronze),
Roslyn (pink),	Golden Gate (old gold),
Portia (pink),	Sun God (yellow),
Autocrat (yellow),	Ivory (white),
Old Homestead (white),	Summit (lemon).

With each 100 I add one each of the following, which alone are worth the price:

Mrs. E. G. Hill, Silver Cloud, Great Republic, Gen. Gth, Mary Hill, Frank Hatfield

Don't miss or pass this unparalleled offer, it will not appear or be made again.

T. H. SPAULDING, Orange, N. J.

THOS. A. McBETH & CO., Springfield, Ohio.

A NEW INDUSTRY.

SEEDLINGS OF

Tuberous Begonias, Gloxinias, Calceolarias

We make a specialty of growing the above plants for florists; having every advantage, we can furnish a superior article. The seed used is the best obtainable, regardless of cost; in Double Begonias we have our own strain, which brings fully 90 per cent of full flowers. All plants sent out are strong thrifty stock from flats, ready for 3-inch pots

Begonias and Gloxinias are ready through May and June, but Calceolarias are only grown on contract, delivery October.

Experienced florists know that *good* seedlings contain finer varieties than the low priced mixtures of Begonia and Gloxinia bulbs. We enable every florist to raise his own bulbs at a nominal cost. Try us.

PRICES: Gloxinias, Calceolarias, Single Begonias, $2.00 per 100; Double Begonias, $3 00 per 100. Delivered by mail or express. Orders booked now.

Address THE AMERICAN FLORIST CO., Chicago.

IN OUR ISSUE for the 17th of August, 1893, we called attention to the fact that the Society of American Florists had provided for the preparation of a list of decorative plants handled by the American trade, to be adopted as the official list of the Society, with a view to securing a uniform and simple nomenclature in the trade. The committee appointed for this purpose has now begun work on the list, with Professor William Trelease, of the Missouri Botanical Garden, St. Louis, as chairman, and desires three copies of each catalogue issued by any American dealer within the last year. These should be sent at once to the chairman of the committee, at St. Louis, marked on the outside, "For the committee's use." We cannot too strongly urge upon every American dealer who issues a catalogue, or who advertises in the journals, the importance of at once complying with this request, so as to simplify the task of the committee, which is at the best a very laborious one; and we are certain that if the wishes of the Society are carried out, the trade will be very much benefited thereby.

C. A. HAYNES, senior member of the firm of C. A. Haynes & Co., New York, custom house brokers in the horticultural trade, died suddenly last week. The business will be continued under the same firm name.

HENRY NUNGESSER, New York, has admitted Marshall H. Duryea as a partner, and the business will be continued under the title, Henry Nungesser & Co.

VISITING NEW YORK: H. W. Buckbee, Rockford, Ill.; John Frazer, Philadelphia.

Clamp Iron for Swing Shelf.

I send herewith a sketch of a clamp iron for a swing shelf that I have found extremely useful, the ease with which it can be lowered or raised nearer the glass giving it an immense advantage over a

fixed shelf. The idea is probably old, but I never happened to see it in use for the purpose and having found it so useful myself I thought there would be others not familiar with it and whom it might also benefit.

As shown in the sketch the device consists of two irons clamping the iron pipe post fastened by two bolts. By loosening the bolts it can be placed at any point on the pipe that seems desirable. The irons I use are 10-inch, carrying a 12-inch shelf. The thing was so simple we made the pattern ourselves and had the irons cast. The two irons and the two bolts cost about 18 cents a set.

You will benefit the American Florist by mentioning it every time you write an advertiser in these columns.

Toronto.

The voice of the bull frog may be now heard in the land, trees are bursting into leaf, gardeners and florists are unapproachable, seedsmen are working day and night, summer is coming and springtime is here (28th April). I mention the date because it is quite possible and even probable that the thermometer may get down in the depths again before this appears.

Cut flowers are very plentiful but prices—well the less said about them the better. Butchers and grocers are selling roses. One of the largest stores in town (where they sell everything, from a paper of pins to a barrel of whiskey) has started into the florist line now, the first in this city to do so. It takes the entire cut of one of the large growers but I have not yet heard with what success.

At the next regular meeting of the G. & F. Association Professor Panton of the Agricultural College, Guelph, will lecture on "Fungi." A social programme has been arranged also. The meeting will be open to all interested. E.

Interesting Questions.

At a recent meeting of a certain amateur horticultural society, the, question box disgorged the enquiry, "Why does Turkshead cacti grow tall instead of round"? The member called upon for an answer replied that he would explain the matter if any body would tell him "why the pumpkin grows round and the cucumber long." Those people must be hard up for subjects.

CONSTANT READER.—It would be impossible to tell you a remedy for "spots on palms" until the character of the disease was determined. Send a piece of a diseased leaf to Prof. Byron D. Halsted, Rutgers College, New Brunswick, N. J., with a request that he name the disease and best remedy or preventive. He makes a specialty of investigating fungous and bacterial diseases of plants. If it is anything new he will likely prepare a descriptive article for our columns.

PANSIES,

THE JENNINGS STRAIN.

THE DIRECTORY

For 1894

IS NOW READY.

St. Paul, Minn.

Trade for the week has been good, an improvement over the previous week. The bright warm weather has brought things forward rapidly and an abundance of fine bloom is now being cut. Prices however remain firm, the best stock selling readily, and there is no glut of anything in the market. Blooming plants are selling fairly well and help to increase the total sales to as high a point as has been reached this year with the exception of Easter. Quite a number of weddings have occurred, as the "mating season" is now on, which have taken some flowers though we have learned of no very extensive decorations.

Department stores have again begun their flower and plant sales, selling all kinds of potted plants at from 8 to 10 cts. each, cut roses at 40 to 50 cts. per doz., carnations 12 to 25 cents per doz., etc. One Minneapolis house recently disposed of 50,000 carnations at 1 cent each. This probably accounts for the large shipments from Chicago noted in your last issue, and fully sustains my argument in a previous number that if they could not buy at home they would elsewhere.

L. L. May & Co.'s establishment is now much like a bee hive. They are shipping immense quantities of plants and report their trade ahead of previous years. Roses, small fruits and shrubs are selling best, while the call for other plants is also very large.

E. F. Lemke has commenced building three more houses. This doesn't look like dull trade or a poor year with him. We hear of more greenhouses to be built this summer. This is very encouraging and would indicate that St. Paul florists have not had so poor a year after all. It would also indicate that with some the demand is keeping ahead of the supply.

In going through the city we see but very few beds of tulips and other spring flowering bulbs. This seems to the writer an unpardonable omission and suggests an opportunity for our florists to drum up a trade in this line. With the present low prices of bulbs and the increasing desire for flowers among our people, a great deal more ought to be done in the bulb line. Nothing is handsomer on the lawn than a well arranged bed of tulips or crocus. A word to the wise is sufficient.

We have heard nothing about a "mum" show for the twin cities. Can't our florist friends drop their petty differences, form a strong society, work together for the common good and show the rest of the country that Minnesota is keeping pace with them in the floral business! We have the florists, the houses, the flowers, the plants, in fact everything needful but unity, rose shows, chrysanthemum exhibitions, carnation exhibits, etc. Cultivate a friendly feeling, get acquainted, drop your jealousies and work together, and you will see better prices, better sales, better stock and better times.

Our Holland friends are still coming. Visitors last week, L. Van Leeuwen, Sassenheim, Holland; J. B. Van Der Schoot, Hillegom, also Mr. Wm. Currie of Milwaukee. FELIX.

Verbenas, Postpaid.

Best varieties of pot plants, $2.50 per 100.

ROOTED CUTTINGS, to close at once, 50 cts. per 100; $3.00 per 1000. As a Special Inducement we will send the Rooted Cuttings PREPAID.

A RARE OFFER! Elm and Ash, Catalpa, Box-elder, Cherry and Lilac Trees, at 20 per cent. discount for cash the balance of the season. Send at once.

2½ to 6 ft. Elms $4.00 per 100.

WILLIAMS & SONS CO., Batavia, Ill.

Manufacturers of "BATAVIA LABELS"

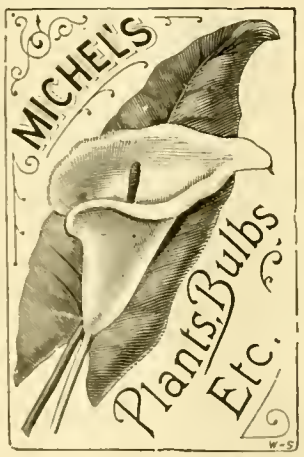
Mention American Florist.

A Few Gems

YOU OUGHT TO HAVE.

FUCHSIA LITTLE BEAUTY.—A Gem of the first water for florists and market gardeners; will produce triple the amount of flowers than any other sort, and a very early bloomer, single blue corolla; sells at first sight. Price $1.00 per 12; $7.00 per 100.

PETUNIA PINK BEAUTY, the best selling plant for any florist, color most exquisite rose, finely fringed and filled; grow a big house full of it and it will net you a quicker net profit than any other plant—$1.00 per 12; $7.00 per 100.



MARGUERITE CARNATION, finest strain for summer bloom; will give you flowers for 5 months outdoors in greatest abundance; $3.00 per 100. $25.00 per 1000.

CHRYSANTHEMUM THE QUEEN, the white Chrysanthemum for the million as pot plant or cut flowers; largest flowers without too much care; $5.00 per 100; $45.00 per 1000.

OUR NEW ROSE AMERICAN PERFECTION.—This sport will produce twice the flowers than Mermet or Bridesmaid on strong erect stems, and flowers will last a week in perfect condition, a vivid rose; also the finest bedder among Teas. Try a hundred; you will not repent it. Only $6.00 per 100, $50.00 per 1000, from 2-inch pots. Send a list of your wants. Address

GENERAL LIST.

Alyssum, double, $2.00 per 100.

Abutilon SOUV. DE BONNE, one of the finest novelties of the year; leaf distinctly and sharply banded with white, very large orange flower on stems 9 inches long, young plants, $2.00 per dozen.

Aloysia Citriodora, $4 per 100 (fine stock).

Asparagus plumosus, 3-inch, $15 per 100.

Begonia Thurstonii, the most useful Begonia extant, fine for bedding or for ornamental specimen, $4 per 100.

Calla Little Gem, the true dwarf Jersey variety, plants from 5-in. pots, 35c each.

Cissus discolor, ornamental greenhouse climber, 50 cents per dozen.

FUCHSIAS, Novelty, **JUPITER**, strong free growing variety, as grand as **Phenomenal** and freer in bloom; color rosy violet, bright red sepals—$1.50 per dozen.

Mrs. E. G. Hill, $3.00 per 100.

Phenomenal, $4 per 100. All the above is extra nice young growing stock.

FICUS VARIEGATA (Golden variegated Rubber), 4-inch pots, $8.00 per dozen, magnificent plants.

GERANIUM MRS. POLLOCK, 50c. per doz.

HELIOTROPE. We had to refuse many orders for the fine French varieties early in the year; we now have these in bright young stock as follows:

Mme. A. Carriere, $1.50 per doz., bright blue, white eye, immense panicle.

Picciola, $1.50 per doz., rosy violet, white eye, immense panicle.

The above are novelties of 1894.

Mme. A. Dubouche, v'lv'ty violet
Mireille, very light
Countess Mortmarte
} $5.00 per 100

The above are very remarkable for their dwarf habit and the immense panicles of bloom.

LANTANAS, two new dwarf varieties, very low in habit. **F. Givandeau**, pink and orange, bordered bright rose.

Amiel (semi-dwarf), reddish orange, yellow center, $1.20 per dozen.

PETUNIAS, DOUBLE. A fine new strain of strong constitution, beautiful in coloring, very large, nicely assorted. $3 per 100.

Palm Areca lutescens, 3-inch, $7 per 100.

NEW SALVIA, THE PRESIDENT, very dwarf, color extremely bright, an early bloomer, per dozen $2.00.

Worcester, Mass.

Cold weather and a severe snow storm on April 12th, the date of the second exhibition of the Horticultural Society, made it risky to move plants openly and kept the out of town exhibitors away, consequently the number of entries was small and the show a disappointment. Those exhibitors that did brave the weather brought only good stuff and captured all the first and second premiums but thirds and fourths went begging.

The display of cut flowers was excellent and made a brave show; there were six entries in this class of 20 vases and the following premiums were awarded: H. F. A. Lange, first; W. J. Wood, second; F. A. Blake, third; the same awards were also made for the unlimited basket.

Hyacinths were not very numerously represented, there being but two exhibitors, Edward Hale and H. M. Chace, whose displays contained some splendid plants and were awarded first and second respectively. The display of narcissus was very good and comprised good varieties that showed careful culture. H. M. Chace first and H. A. Jones, second premiums. Tulips were conspicuous by their absence and the display of zonal geraniums was not up to the standard.

The next show is scheduled for May 10 and calls for hyacinths and tulips (open culture). Azaleas (mollis), pansies, pelargoniums and cut flowers.

The market is overstocked with first-class stuff and trade is very unsteady; prices only fair.

Early flowering shrubs, fruit trees and bulbous stuff were considerably damaged by a heavy fall of snow on April 11 and 12. SEEDLING.

10427. 75 cts.

New Catalogue (No 4) containing over 1000 Ornamental Cuts for Florists' use, such as envelopes, letter-heads, bill-heads, cards, advers., floral designs, etc., at from 30c. and upward. Price of Catalogue 25c. (deducted from $1.00 order).

H. W. TURNER, Chrysanthemum Specialist, SHARON, PA.

Fenster Pappe,

A Substitute for Glass. Stretch FENSTER PAPPE taut and use batten in nailing on to sash. Then paint the rough surface thoroughly with boiled linseed oil until it shows a gloss. Let it become THOROUGHLY DRY before using, when it is claimed to do service for years. The application of the oil makes FENSTER PAPPE sufficiently translucent for plant life.

IT IS USED as a covering for cold pit sash; excellent for use in palm or fern houses; to grow strawberry plants, early vegetables, tobacco, etc., under. A most handy article as a protection against the direct rays of the sun.

TRY a roll of eight yards as a sample, which will cover about four sash, for $1.00. Original rolls, 36 inches wide, 110 yards long, for $9.00. For further particulars address

August Rölker & Sons, Sole Agents, 136 & 138 W. 24th St, New York.

Some "Poutry."

Only very poor roses, which fall easily apart,
I give those for nothing, by the pint or the quart,
But the fragrant and fresh ones, the best of my roses,
Those you can't get the smell out of (with all your big noses,)
Which are grown by myself, as is home made bread,
And are useful for weddings, for births and for deaths.
You can't get those cheaper than up on Eagle stre-t,
Where I always with pleasure my customers meet.

The above adv. in rhyme I cut out of a Dunkirk, N. Y., paper. The gentleman infers that he also keeps a bakery. If he intends to keep on writing his advs. in "*poutry*" I should recommend him strongly to visit the Quaker City and take a few lessons from the "Bard of Darby Road," whose Byronic style is so charming and yet so easily read, so unlike Browning or Whitening. W. S.

A Remarkable Case.

A letter to the Secretary of the Horticultural Society: "SIR—I particklу wish the Satiety to be called to consider the Case what follows, as I think it mite be maid Transaxtionable in the next Reports.

My Wif had a Tomb Cat that dyd. Being a torture Shell and a Grate favirit, we had Him berried in the Guardian, and for tho sake of inrichment of the Mould I had the carks deposited under the roots of a Gosberry Bush.

(The Frute being up till then of the smooth kind.) But the next Seson's Frute, after the Cat was berried, the Gosberris was all hairy—and more Remarkakle, the Catpilers of the same Bush was All of the same hairy Discription.

I am, sir, your humble servant, THOMAS FROST."—*Exchange.*

Messrs. Kroeschell &
41 to 59

Chicago.

Gentlemen:

Last season we purchased three of your Improved Green House Boilers. They have done heroic service the past winter — Clipping every claim you made. Since Feb. 25th one large boiler has been doing the work of two, heating six houses 185 ft. + 24 ft., with 9 pipes (4 inch) each; i.e. about 26000 square feet of glass, the hot water being forced through nearly two miles of 4 inch pipe. While the weather has been mild we doubt this showing can be excelled. Needless to add your boilers please

Yours Very Respectfully

Hot Water Under Pressure.

In your issue of February 1st your correspondent is evidently laboring under a misapprehension as to what a closed system of hot water heating is. The system he describes is not a closed system at all, but an open system pure and simple, with elevated tank which gives a constant pressure at all times, while the closed or pressure system has an expansion tank of sufficient capacity to retain expansion of water when heated, *closed entirely*, with safety valve, etc., at pressure required, just the same as for steam, the pressure being obtained by heat and *not* by expansion tank being elevated.

As to the merits of this system, so far as our experience goes, its advantage does not lie in economy of either fuel or attendance but in economy of construction, as a system of this kind requires less pipe and a higher initial temperature can be obtained, in fact the same as steam under the same pressure, so that this system can be put in just the same, so far as radiating surface is concerned, as steam, and has the additional advantage of a minimum amount of heat in mild weather, while with steam 212° would be of course the maximum.

If we were advising your correspondent we would say let well enough alone. If his apparatus did not give heat enough then we would say close it providing it was strong enough to stand the pressure, and he would be able to get a higher initial temperature.

As to claims of economy for this system over other properly constructed systems, it has none whatever. Water is a medium through or by which heat is conveyed and it is immaterial whether it is conveyed in a large body of water at a slow circulation and low temperature or in a small body at a high rate of speed and temperature, *the quantity of heat* conveyed is just the same.

From our standpoint we can see no room for a controversy between different systems. They all have their advantages under certain conditions, and these conditions should do all the arguing in the matter of choice of systems.

Hoopeston, Ill. A. L. SHRIVER.

[As the above touched upon technical matters about which exact information from a trained engineer was desirable, we submitted the article together with a copy of the notes that appeared in our issue of Feb. 1, to Mr. Lincoln Pierson of the Lord & Burnham Co., with a request for his opinion as to the correctness of the views expressed in the article. Mr. Pierson replies as follows: "I have looked over the communication which you enclose and believe that your correspondent's views are correct so far as regards the closed tank or "true pressure" system of hot water heating. The method described by Mr. May in his article is not the true pressure system, although by some people it is supposed to be. The true pressure system can only be obtained by means of bottling up the apparatus, or in other words, closing it entirely to the atmosphere."—ED.]

TO TAKE PLACE OF WIND MILLS

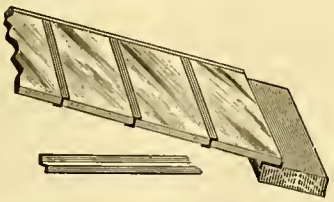
HOT AIR PUMPING ENGINES

A Windmill

Is unreliable because it depends upon the elements for its power; hydraulic rams also depend upon favorable conditions and waste as much water as they secure. Steam pumps require skill and hand pumps demand labor and time. The

DE LAMATER-RIDER OR DE LAMATER-ERICSSON Hot-Air Pumping Engines

are especially designed for pumping water, and from shallow streams or any kind of well. They are simple, safe and reliable, require no steam and have no valves. They require very little heat to operate them, and can be arranged for any kind of fuel.



Send for illustrated catalogue to

THE DE LAMATER IRON WORKS,

87 South Fifth Av.,

NEW YORK, N. Y.

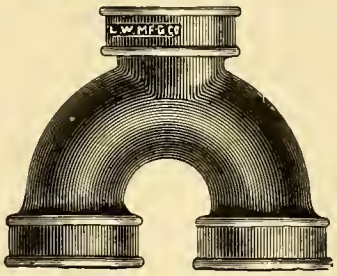
IMPROVED GLAZING.

GASSER'S PATENT ZINC JOINTS for butting glass makes greenhouses air and water tight; also prevents sliding and breakage from frost. Does not cost as much to heat a house glazed with the joints, thereby saving enough in fuel to more than pay the additional cost of glazing. The leading florists of the country are using them. Write for circulars with full particulars and price list.

J. M. GASSER, FLORIST,

Euclid Avenue, CLEVELAND, O.

THE CHAMPION Automatic Ventilator.



The cheapest, easiest to operate, and by far the best machine in the market. Don't buy a Ventilator until you have seen my illustrated descriptive circular, which will be sent you free, giving prices, etc. Also Champion Soil Pulverizer and Sifter.

Address, E. E. WOLF,

Box 114. SPRINGFIELD, O.

Greenhouse Pipe and Fittings.

Large quantities of our Pipe are in use in Greenhouses throughout the West, to any of which we refer as to its excellent quality.

Pipe can be easily put together by any one, very little instruction being needed.

DO YOU WANT Mr. Scott's seasonable hints for the year in book form, so that you can refer readily to his suggestions for any week in the year? You will find them in this form in our trade directory and reference book for 1894. Price $2.00.

DO YOU WANT a list of trade organizations, both national and local, with names and addresses of principal officers, time and place of meetings and other information? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

OUR trade directory and reference book for 1894 contains 270 pages of information of real practical value to every one in the trade. Price $2.00.

Specialties in the Business.

[A paper read before the Gardeners' and Florists' Club of Boston by William Scott, of Buffalo, N. Y.]

The status of and way in which the florist and nursery business is carried on in the United States cannot be compared with that of Europe, or in other words Europe is no guide for us. Regarding the early history of floriculture in New York it is said that when Andrew Reid purchased a flower for his shoemaker's shop, it attracted the attention of a passer by and he purchased it. Mr. Reid procured another and that finding quickly a buyer, Mr. Reid was led into keeping a store for the express purpose of selling plants. This story (perhaps mythical) is as nearly true as I remember it. But if you doubt it a far more reliable and very modern instance of a man embarking in the flower business exists in one of the largest and best known cities of Ohio. This man, whom you all know, was 17 years ago a letter carrier. His wife kept an ice cream stand in a very small store and properly thought that a few bouquets (so called) would help make her ice cream attractive. Ladies came in to refresh themselves and asked if the bouquets were for sale. They were, and more were secured in their place until the shrewd proprietor saw that it would pay to make a specialty of flowers as well as candy and ice cream. Soon the flower trade outgrew the other and after many changes, always upward, that man to-day owns 80,000 feet of glass and his store in the city is equalled by few in the country and surpassed by none. I am only giving you these instances for the purpose of showing how comparatively modern is the florist business as it exists to-day in America, and if I may be allowed to digress for a few moments I can remind you all that it is within the memory of almost the youngest member here, when stores entirely devoted to flowers did not exist even in the great eastern cities of New York, Boston or Philadelphia. By degrees they grew; one started and then another and to-day florists' stores occupy the most prominent and high priced localities in all our large towns.

The growth of our business surpasses in my opinion all other contemporary industries, and is so remarkable that it has intoxicated with its exuberance many of those who are engaged in it. The remarkable growth of the business which I may call the sale of flowers has been altogether more rapid than can reasonably be attributed to the growth of population. It has surpassed what you expect from that cause more than tenfold. It must be attributed to a higher cause than numbers and that is the vastly increased taste among our wealthy people for something of an artistic and refined nature. They have indulged in flowers to their hearts' content until flowers have become as much a necessity in their houses as pictures and plate. They are a luxury which cannot be dispensed with. The priceless pictures of Raphael or Michael Angelo may adorn their walls but they have become tame in looking at them and it takes a bunch of American Beauty, with nature's sweet odor, to arouse enthusiasm in the over pampered breast. Flowers have come to be universally used in this country and in all the civilized countries of Europe (there are several that are not). In fact there are many occasions in our social life where we cannot do without flowers in whatever sphere of life we are; and this is not a passing fashion.

The brief review I have given of the business is only to impress upon you the magnitude to which it has grown, and to dispel from the hearer any idea that we must be guided by what they are doing in England and Scotland, or more properly the British Isles. They have always been famous for having the finest establishments in the world in a general business, while France, Holland and Belgium have been known to have the greatest places devoted to specialties. Our business here however has nothing to do with whatever they have done because our surroundings and demands and people are as different as highly civilized people on the same globe can be.

Now, gentlemen, I have come down to what I proposed to talk about. In cities of less than fifty thousand perhaps a general business must be carried on to ensure general patronage; but as the vast majority of the floral business is represented in the cities of fifty thousand and over it is to the man who is contributing his products to the large cities that I presume to give a little advice. To the man who is already well started, who grows carnations in the winter, bedding plants in the spring and 'mums in the fall, and who caters to the public the year round for cut flowers and plants, I have little to say, because he has a business that has probably paid him very well and he would sacrifice something to make a radical change. But to the young man who is about to start out with his little capital in the florist business (perhaps mostly for gain and many times largely because he likes it) I say, make a specialty of some particular branch. This has become almost a necessity if the florist wishes to rise above the level of common mediocrity or even get a substantial living.

Now what are the specialties? In a broad sense they can be classed into two great divisions, the grower or producer and the retailer who faces the consumer and extracts from him the money and from whom the money passes down to the grower and his assistants. I shall never forget the wise words of a gentlemen you all know so well, Mr. John Westcott, of Philadelphia, who, when walking up Broad street last November remarked to me that a grower should never keep a

store. To me who was in that fix I thought it strange but with his explanation I entirely agreed. And this was his argument: "If you grow and keep a store you are bound to sell your own stuff first even if it be not A 1; you want to sell that before you buy other flowers. In selling this second-class stuff you will very likely have dissatisfied some of your best customers who demand only the best, while the storekeeper who grows nothing is not bound to buy anything except it be A 1, and can keep up the quality of his goods without much trouble. If one grower does not have the desired quality another will." To quote still another friend, there is indelibly impressed on my memory the remark that was made to me eight or nine years ago in Buffalo by a gentleman whom you all know—Mr. Wm. J. Stewart—that in a few years if I kept a store I should not be growing as well. That sounded to me very strange at the time but nevertheless he was right. Not only are store keeping and growing two entirely different businesses but the grower's business now-a-days can be divided into half a dozen specialties, and that with advantage. When you have only two or three varieties of plants to grow you can bring all your skill to bear in growing them to perfection. You will grow them with relatively less labor, you will get a reputation for that article or class of business and can be depended on to fill orders for the same at all seasons and fill them well. Remarking to a renowned botanist but a few days ago that there was a great study in our plants, he said "yes, there is a study of a lifetime in a single plant." If this is true surely to grow a few species to perfection is enough for anyone to aspire to. It may not be as interesting to the real lover of plants to have to confine his collection to a few popular plants but to be commercially successful it is absolutely necessary that he does not spread himself all over the vegetable kingdom. The ladies in the business I am sorry to say have the greatest weakness for making their greenhouses more like botanical collections than commercial collections in which there are dollars and cents.

Twenty years ago there was scarcely an establishment in the country exclusively devoted to the growing of cut flowers. Now there are hundreds and many of them growing only one kind of flower, and wherever they have devoted their entire energy to one class of plants and religiously adhered to that specialty they have been successful. The rose has taken the time and attention of more men and occupied more glass than any other flower, and wherever an intelligent man has devoted his entire attention to the rose he has invariably been richly rewarded. The carnation occupies now decidedly the second place in the estimation of the public and millions of feet of glass are devoted to producing this most popular flower. Many men have made a specialty of the carnation and have made money by it, giving their whole attention to it and growing the flowers to such perfection that there is always a demand for their quality of goods. I know of men who were very successful with carnations and making money but were not satisfied; they must go into roses and their income has in consequence been much curtailed.

Another man devotes his glass to the forcing of different bulbs. This, the past year or two has been anything but lucrative and if it continues so these men will go into some other department of the business which is at present more profitable. We have firms in the east as well as the west who are making a specialty of smilax; one firm in Ohio grows nothing else the year round and they are very successful in every way. Some growers in the east are "smilax kings," so great and powerful is their sway among the trade. Other men have made an exclusive business of growing adiantums, the favorite maiden hair fern. In the neighborhood of all large cities there is room for many thousands of feet of glass devoted to this indispensable favorite, and if well grown it will yield a rich harvest to the cultivator. It is never overdone and while there is not much profit in a few slug-eaten, picked-to-death plants in a retail greenhouse, there is a rich revenue to the man who grows ten thousand feet of bench room of it and does it well.

There are other men, and very prosperous men, in the business who leave roses, carnations and other flowers alone and who grow what may be called market plants, or fine plants for the stores. They retail nothing but grow large batches of popular plants and do them so well that their products always command the best price. There are others who grow nothing but palms, making a specialty of these beautiful plants and growing them so perfect that their stock is always in demand.

There is in every city of any size a large demand for plants to fill veranda boxes and vases, as well as flower beds. To do justice to these and grow flowers too is almost impossible and they should be carried on in different establishments. There are in this branch of the business a few months in the summer and fall when the houses will be comparatively unoccupied, but there is always something to be found to fill up the short gap. Chrysanthemums can be grown and flowered and out of the way before the bedding plants need much room.

Then there is the purely market grower who has large quantities of the popular cheap plants and disposes of them in the public market. My first venture in the commercial line was in this way and I never made more money in proportion to the size of the place than I did then. I had no retail business to bother me. I grew large quantities of the then popular plants such as geraniums, fuchsias, calceolarias, show pelargoniums and several others. I got my ready money and returned home happy. There is to-day in the neighborhood of every large city plenty of room yet for some first-class market growers.

I believe I have said enough to show you that in my opinion there are many branches of the business, each one sufficient to occupy the time and brains of any intelligent man. I have not nearly covered the ground in which specialists exist; neither do I say but what with a shrewd and careful management occasionally it will be found profitable to occupy your glass for a time with a crop outside your specialty. But as a rule the successful man will be found devoting his time and energy to some particular branch and doing that with all his might.

The education of the young American florist is also more adapted to specialties than to a general business. Most of our older school of gardeners have been graduates of the private gardens or nurseries of Europe, where, rough as the life was, they were supposed to learn every kind of garden operation, from laying sod to tying out a specimen heath. They know how to nail a peach tree to a wall and how to handle a spade, but let the best of that school stand up against the young American at the potting bench and he would not be in it. At the same time our young American who is such an expert with the pots and soil and sticks, is too often a very useless creature when you want him to do something outside. He has never had an education that way, which only shows that in our business as in all other industries we are up to the times and what is known as division of labor exists.

In conclusion, young man, and it is for you I write—find out to what particular branch of the business your taste leads you, then embrace it and work at it with all your strength and intelligence. You will find there is as much compensation in one branch as another. The man who is paying rent for a five thousand dollar store is perhaps making no more clear profit than he who has two houses of violets. Whatever you do, if you are in the vicinity of a large city, don't go into the general business and undertake to supply everything in the trade. If you succeed in pleasing your customers you will be a short lived wonder and as bald headed a victim as your humble servant, whom you can take as a horrible example of that class which has foolishly dabbled in every branch of the business.

[See Boston notes for discussion.]

The Pelargonium as an Easter Plant.

The accompanying engravings are from photographs sent us by Mr. Aug. S. Swanson, St. Paul, Minn. He writes:

"I believe the pelargonium will take a prominent place as an Easter plant. I had about 100 plants in 7-inch pots that were very fine. Each plant was from 4 to 5 feet across the top, from 2½ to 3½ feet in height, and with from 20 to 30 trusses of bloom and from two to three times that number of bud clusters. There seems no great difficulty in having the plants in fine condition for Easter. The varieties I grew were Mme. Thibaut and Mrs. Sandiford, and a curious thing about them is they are intermixed and some plants are half one variety and half the other. I have had several plants of which one-half would have the pink blossoms of Mme. Thibaut while the other half would be pure white.

"The plants were some that had been left over from last summer's sales and they had received rather rough treatment during the winter, being thrown under the bench of a violet house in the fall to make room for other things. They were left there till about the middle of January when they were taken into a light house with hydrangeas. While the hydrangeas were too late for Easter sales the pelargoniums came too early and had to be transferred to a cool house and retarded by maintaining a very low temperature. In my opinion they will make very satisfactory plants for Easter. Their greatest defect is that the flowers don't last as well as one would like in a close and warm atmosphere, as in a living room. They have an exasperating tendency to shed their petals, but their other good points are so numerous that we can overlook this fault.

"The photographs were taken in the store where the plants were displayed for sale at Easter, and as there was a continuous stream of people passing and no space to spare there was no opportunity to place them to advantage. Still probably they give a better idea of the plants than a mere description."

DO YOU WANT a list of the leading park superintendents of America? You will find such a list in our trade directory and reference book.

PELARGONIUM AS GROWN BY MR. SWANSON FOR EASTER SALES

Growing Dutch Bulbs in America, Also Lilacs for Forcing.

The past season has been a most disappointing one to those engaged in the forcing of bulbous stock, particularly as regards tulips and daffs. Although the prices at which imported stock is offered this year is lower than last year, still the figures asked by our friends from Holland are such that when the grower considers the returns from cut blooms realized this past season actual loss must inevitably be the result of an investment in this stock.

We doubt if the tulip ever becomes as popular a cut flower again as it was 4 or 5 years ago, but yet this flower will always have its admirers. Large quantities were sold last season, and probably will be in the future, but fancy prices are a thing of the past. The grower cannot afford to pay from $10 to $20 per thousand for bulbs when the flowers will not sell for any more than the cost of the bulbs.

We have been watching with considerable interest the experiment in bulb growing at the Klehm Nurseries, at Arlington Heights, Ill. Some 3 years ago we had occasion to make mention in these columns of what at that time was entirely the experimental stage in this enterprise. Since that time much progress has been made. It is demonstrated here beyond all doubt that bulbs of various kinds, particularly tulips, daffs, lilies and valley can be grown of good forcing qualities and at a much less cost than the figures asked abroad.

Let us look at the tulips first. At the time of writing, May 2, the earlier varieties, such as Chrysolora, Yellow Prince, La Reine, etc. have gone out of bloom. Tournesol, Thomas Moore, Crown Prince of Austria and many other intermediate sorts are at their best, making a grand show. But most of the plants are not allowed to develop their blooms in order to strengthen the bulbs, yet enough flowers are gathered and sent to the market to nearly cover the cost of growing the bulbs, although the prices realized this year are very low.

The varieties grown are such leading sorts as are desirable for forcing, but all varieties do not succeed equally well. Crimson King, Duc von Thol, red and yellow, are found doing but poorly. These sorts neither make strong bulbs nor multiply fast enough to make growing them profitable. On the other hand Chrysolora, Yellow Prince, Kaiser Kroon, La Reine, Proserpine, Coleur de Cardinal, Tournesol, Thomas Moore, Crown Prince of Austria and others thrive exceedingly well and multiply rapidly. All these sorts have been tried for several seasons and found to force equally as well as imported stock. Besides the above named varieties there are other sorts not classed as forcing varieties, such as Parrot, Gesneriana rectified and yellow. The imported stock of the parrot tulip, as is well known, cannot be depended upon to yield more than 50% of bloom. Here we note that a bed containing some 5,000 bulbs of only medium size shows scarcely 5% blind. It is Mr. Geo. Klehm's opinion that this variety, with home grown stock can be profitably used for late forcing, he having tried it successfully in a small way. The same might be said of Gesneriana.

Now let us look at the cost of growing them. We find this spring between 350,000 and 400,000 bulbs grown on about one-half acre of ground. The soil is a deep, rich, dark and rather heavy clay, altogether different from that found in the bulb growing districts of Holland. The ground is tile drained and has been under high cultivation for a number of years. The value is about $250 per acre which is $125 for the piece devoted to tulips. It takes three years to grow a bulb to a forcing size. This would make $375. At 6% the interest in round figures would be about $24. Take the lowest number, 350,000, grown on this area, the cost per 1000 for the land would be a trifle over 70 cents. The bulbs are taken up and replanted every year. The cost of this is estimated at 50 cents per 1000 each season, for three years therefore $1 50. No cultivation is needed until the leaves have died off. The bulbs are grown in beds about 5 feet wide, quite closely together so that no weeds appear until the tops dry up. After that the ground is hoed over once before the bulbs are taken up about July 1. Cost of cultivation per 1000 for three years 75 cents, making a total cost in round figures of $3 per 1000. But as stated before, the cost of cultivation can be covered by the sale of cut blooms if situated near a flower market. But care must be taken in cutting the flowers, at least one leaf should remain as otherwise the bulb is injured. On the whole not much dependence should be placed on the revenue from this source. It is much better to sacrifice the flower. The blooms may be allowed to remain on the plants until they are nearly gone but should then be whipped off.

The natural increase of the bulbs depends somewhat on the varieties. Some of the most expensive sorts, such as Cottage Maid and Proserpine, which our friends on the other side claim increase but slowly and retain their high figures largely on that account, are found quite prolific here. The average increase of most varieties of fair sized bulbs is 3 to 1. Of the whole number of bulbs grown between 75,000 and 100,000 will be of suitable forcing size next fall.

As before stated the bulbs are taken up about July 1 and cured in an airy shed. Those not required for forcing are replanted between the middle of August and September 10. No mulching of any kind is required to keep them from freezing out. The bulbs are not planted as deep as is the practice abroad, the average depth being about 3 inches.

In daffodils quite a number of varieties are grown but the bulk of the stock consists of Von Sion. Daffs do very well but require somewhat different treatment than do the tulips. For several seasons the bulbs were taken up and replanted every year but no headway could be made with them. As treated now the bulbs are left undisturbed until of a forcing size, the small brood being replanted and left alone for three years, when again the forcing size is sorted out, and thus a rotation of different batches is kept up.

Lily of the valley is grown very successfully. About ¾ of an acre is planted out, these are grown in rows 22 inches apart and ½ inch in the rows. These are cultivated by horse power, or mule power rather. Mr. George Klehm is the happy possessor of a veteran mule that is worth

his weight in gold. A thousand dollars wouldn't tempt George to part with this animal. He is ready to lay a wager of a hogshead of wine (we counted 13 of the latter in the wine vault and can vouch for its being the genuine stuff) that this same mule will travel up and down between rows not more than 6 inches apart and not once step on a plant. Forcings from these pips have been made several seasons with the very best results. Our summer season being warmer than in Europe the pips ripen much earlier and for early forcing particularly the home grown stock is superior to the imported. We couldn't obtain exact figures on the cost of production, but the figures as estimated are far below that of imported stock.

A number of varieties of lilies are also grown with success. L. longiflorum thrives like a weed and multiplies like a mushroom. There are at present about 4,000 plants of this variety in the greenhouses just coming into bloom, being the strongest and most vigorous plants we have ever seen. The bulbs are planted on benches, 8 inches between rows and 6 inches apart, each bulb averaging two stalks with from 2 to 6 blooms to the stem. L. auratum, roseum, rubrum, excelsum also thrive well, all being perfectly hardy, wintering without the least protection.

We note a departure at this establishment in still another field which has never been, at least to our knowledge, much explored before and that is the growing of lilacs for forcing. The call for lilacs is constantly increasing in the winter season, and would increase much more if the flowers could be grown at a lower price than is the case at present. This of course can only be done when the price of stock is lowered. So long as we are using imported stock at $40 to $45 per 100, the flowers cannot be forced with profit at a less rate than is at present charged for them. But if the cost for stock can be reduced one-third and the price of the flowers one half, lilac is destined to become much more popular than it is now. And not alone for cut blooms. Grown in pots it will be found profitable, especially at Easter.

The stock grown here is grafted on California privet, which is done in the winter season. The grafted stock is then packed in flats, kept moderately wet and started to grow in the greenhouse. About the first of May these are planted out in the nursery and in two years make fine plants of the size usually imported. The stock is as easily grown as lilac on its own roots. Not being subject to disease there is no loss except occasionally from the attacks of the grub worm.

The cost of grafting is not very great. A man can easily set from 800 to 1000 a day with a boy to do the waxing and packing away. The cost of privet stock is from $18 to $20 per 1000. The loss from grafts not setting is small. Out of 4,000 grafted last winter not more than 20 have failed. Mr. K. stated that stock can be grown at a good profit to the nurserymen at $15 per 100.

All the stock of hybrid roses used for forcing is grown on the place, all grafted on Manetti. The tap roots of the Manetti are cut up into pieces 2 to 3 inches long, being what are known in nurserymen's parlance as "rat tails." From 5 to 10 pieces of a one Manetti stock are made on to which the different varieties are grafted. In two years strong plants are procured ready to force.

We also note that in the greenhouse department such varieties as La France and Beauty are grafted in the same way. No advantages are claimed for grafted stock over that grown on its own roots but it is found that cuttings taken from these varieties root very poorly, and grafting is found to be surer and quicker work than rooting cuttings.

Carnation Notes.

Presuming that they are all planted in the field there is very little more to say in regard to their culture, but they will still require constant care and attention. If you are growing a general line of stuff other things will be taking up your time but under no circumstances neglect your carnations; if they need topping, top them; if they need hoeing, hoe them.

There should never be any weeds in your patch to hoe out; they should never be allowed to start. A good rule is to work them after every rain; this keeps the ground nice and loose, does not allow the weeds to start and the loose ground acts as a mulch to keep the plants in good growing condition. By going over your patch after every rain the work is not so hard and there is very little more time consumed taking the whole summer together than there would be if you allowed the ground to become hard and the weeds to get a start on you before working them.

There is quite a diversity of opinion as to just the proper time in a carnation plant's growth to top it. Some favor topping them quite young and down to the second or third joint from the ground. This method does unquestionably make a fine looking plant. It has however some serious disadvantages connected with it. In a very heavy rain storm (such as we often get during the summer) it being so close to the ground will be splashed full of mud, which lodging in the joints will stay there and affect the health of the plant. The foliage being so near the ground makes a harbor for all kinds of insects. The same faults follow such plants when planted in the house, and they are like a great many more things, not so good as they are good looking. Topping a plant too soon or too low also affects its root development. All of these things are not immediately noticable but it is well to remember that there is from twelve to fifteen months' work ahead for your plants to do yet and everything possible should be done to keep them in good healthy working shape.

I have always made it a rule to allow my plants to get well started in the field before topping them. We then do not attempt to finish them all at one time but go over the patch, taking out all that are large enough to leave five or six joints to the plant. By leaving this number they are not so likely to break shoots near the ground and the plant is not checked enough to injure its roots. Of course there are exceptions; if we find a plant is not growing up nice and straight on account of being top heavy we take it out farther down, the object being to have for planting in the fall a medium sized plant, nice and straight and stocky. It may be a month before they all get topped this way but it is better than taking them out too soon.

I always attend to this part of the business myself, as it gives one a good opportunity to personally inspect every plant in the patch, and keeps me posted as to the exact condition of my plants and the prospects for next season. It is not an awful jolly job to go over fifty thousand plants, but anyone who expects to make any money out of carnations and has not unlimited capital to start with will have to get down and hustle or be a back number. The price of success in this business is eternal vigilance and an awful lot of good hard brain work and it is becoming more so every year. ALBERT M. HERR.

Chester County Carnation Society.

The regular meeting for May was held in the room of the society May 5, with but few members in attendance, as many were still busy planting out.

A letter was read from F. Dorner & Son, La Fayette, Ind., acknowledging receipt of the gold medal awarded at the meeting of the American Carnation Society for carnation "The Stuart."

The thanks of the society were extended to the American Florist Co. for a copy of the new directory.

The society expressed its appreciation of the notices of our meetings and for timely articles on carnations by the West Chester *Village Record*.

E. Swayne, speaking on planting out, said he was growing plants in trays mainly and when dry the plants were watered over the top, which he thought retained more soil than when roots were dipped.

Pres't Ladley reported young stock of Buttercup in 2¼x3-inch pots at least double the size of plants of same age grown in flats. Sec'y Shelmire grows all his stock in pots and thinks he cannot afford to do otherwise.

From reports made the total plant for this season by members of this society will exceed 750,000.

A number of seedling blooms were shown; several by C. S. Swayne, all on extra long, strong stems; one by E. Swayne, almost pure yellow, had been cut 15 days, a stem 28 inches long, of magnificent proportions; when cut measured 2⅝ inches and to-day measured 3 inches and in excellent marketable condition. These were nearly all seedlings from Cæsar crosses. C.

Carnation Rust.

Look upon the rust just as the rose growers do upon mildew, as an evil that is bound to come and do serious damage if preventive measures are not adopted. A rose grower no longer even dreams of attempting to grow roses without using sulphur in some form to kill the spores of mildew in the atmosphere. He can't see the spores, but he knows they are there. It is now just the same with the carnation rust and similar fungous diseases of the carnation. You can't cure the plants when the rust has once got a hold and you can't detect the presence of the rust until serious damage has been done. But you *can* prevent the spores from germinating on or in the plants by the application of fungicides as a *preventive*. We may set it down as practically useless to attempt to keep carnations free from fungous pests unless preventive measures are adopted and followed up regularly, just as we now use sulphur to *prevent* mildew, and tobacco to *prevent* greenfly. The following mixture will *prevent* rust:

Dissolve one pound of sulphate of copper in two quarts of ammonia in a 2-gal-

PELARGONIUMS IN MR SWANSON'S STORE AT EASTER.

lon jar. When dissolved add another quart of ammonia and stir well. [The liquid can be kept in this form for some time and used as needed.] Add a pint of this solution to a barrel of water and syringe the plants with a force-pump every two weeks. And don't let the time for spraying pass without attending to the operation. To insure against forgetfulness take your calendar and mark a cross on the dates upon which spraying should be done for the remainder of the year.

This constant spraying will do more than prevent rust; it will prevent other fungous diseases from getting a foothold. And should you accidentally import some rust affected plants the disease will be confined to those plants, for the spores cannot germinate on the sprayed plants if the spraying has been thoroughly and constantly done.

Ridding Carnations of Red Spider.

ED. AM. FLORIST: In your issue of April 26, Mr. A. M. Herr requested some one to suggest a practical remedy for the spider. As I have rid my plants of the pest more than once I take the liberty to advance my plan which is, take clear water, heat to a temperature of 135°, apply with a hand syringe, making sure to get under the foliage; do this 3 days in succession, weather permitting, using the middle of the day for the time of action.

But there is no excuse for having red spider. With us carnations will take all the syringing needed to keep down the pest. I have been growing carnations for 19 years, syringing foliage from bottom to top throughout at least three times a week at this time of year, and in midwinter at least twice a week, first having picked all open flowers, for I admit that the flowers will not stand much, but the foliage will, and if it happens to cloud over close up the houses and start up a little steam until dried off, as I do not like to have them wet over night. I have never had disease of any kind, nor red spider, only in odd corners due to neglect of the waterer. I believe that if all carnation growers would use the hose a little more freely there would be less disease and less spider. If the soil is too heavy to take much water this can be remedied by mixing a fair proportion of sand with it.

Westerly, R. I. H. SIMPSON,
Foreman for S. J. Reuter.

Staking Carnations.

I have noticed in the AMERICAN FLORIST descriptions of various methods of staking carnations, but I think my plan is better than any that have been described. I weave a wire frame as wide as the bench and in sections 6 feet long, with a 6-inch mesh. This is placed over the bench of plants being held at a suitable height by uprights attached firmly to the side of the bench. The uprights are provided with eyes so that the frame can be carefully raised as the plants grow and thereby kept at the most convenient height. The frames will last for years with care and are a great saving in labor over staking, and in time in picking the blooms also. It is often difficult to cut a long stemmed bloom from a plant that has been tied up to a stake without untying the plant and then retying after cutting. J. NORRIS.

Montreal.

Packing and Shipping Cut Flowers.

I would like some information about packing and shipping cut flowers. How long a distance can cut flowers be shipped and arrive in good condition? A. J.

The question is so broad that the answer must necessarily be a general one. In deciding how far flowers can be shipped to arrive in good order, we must take into consideration what the flowers are, how they have been grown, the season, the weather, etc. It may be stated broadly that outdoor grown flowers will not stand as long as those grown under glass. This is especially true of roses, which are of little use twenty-four hours after being cut out of doors. Flowers grown cool and slowly matured will stand more handling and last much longer than those which have been forced under excessive heat, and it need scarcely be added that they will carry farthest in cool weather.

It is the practice of large growers of flowers for market to put the blooms as soon as cut, in a cool dark place for a few hours with the stems well immersed in water so that the pores become well filled; this makes a great difference in their keeping qualities.

But few sorts of flowers will stand wetting of the blooms. Plenty of moisture for the stems and foliage but none for the petals is the rule to be observed. Violets, and sweet peas are ruined at once if wet, and the same is true to a greater or lesser extent of carnations, lilies, mignonette and many other sorts.

In warm weather, also in cold weather if the flowers are to be transported in a warm car, ice should be used to prevent their getting heated but always taking precaution that the ice cannot soak the blooms as it melts, also that it is so confined that it will not when reduced in size by melting slide round in the box and thus do injury.

All kinds of flowers are injured more or less by being packed in deep boxes unless provision is made by the use of slats or shelves to protect those on the bottom from the weight of those on top. Nothing is better than a number of shallow trays or boxes placed on top of each other.

The buyer receiving flowers from a long distance should at once after unpacking them cut an inch or so off the stem and place the flowers in water in a cool place for a short time before using them.

It is well to remember in conclusion that flower buyers are more critical now than they were a few years ago. Flowers were shipped long distances and were acceptable in localities where the local supply was not equal to the demand even though they showed signs of fatigue from the long travel. Flowers which were accepted without question a few years ago in such places would be valueless to-day, as the buyers have been educated up to the point where they will be satisfied only with stock that is not only perfectly fresh, but has also all the other requirements of first-class goods. S.

Snails on Mushrooms.

We have a large bed of mushrooms under a carnation bench but are much troubled with snails that eat the mushrooms. We have used all sorts of things to catch them, have placed lime around the edges, etc., but the trouble continues. How may we get rid of the snails? There is a tile drain running under the greenhouse to carry off surface water from high ground. Could they come from that? It does not open into the greenhouse. L.

Regarding the snails on mushrooms I would state that I have been troubled with them in the same way and under the same conditions as has your correspondent. While the beds were showing a heavy and paying crop I used the usual remedies, such as cut potatoes and apples and in this way got a few of them, but if Mr. Snail came across a fine tender mushroom in his travels he ate the mushroom and didn't seem to be at all anxious to hunt up the potatoes or apples. So I made up my mind to experiment when the beds were nearly spent, and there would be little to lose. I gave the beds a good

liberal sprinkling with slacked lime. Of course it killed the snails. What I was anxious to find out was how it would affect the mushrooms. What were above ground it did not hurt in the least and the beds have produced as many mushrooms since as I expected them to do even if I had not applied the lime. I don't know if any one has ever done this before; I never heard of any one doing it. I intend to test it on some that are showing a heavy crop to see whether it will have any bad effect on the mycelium and will notify you of the result.

Milton, Mass. GEO. M. ANDERSON.

Carrying over La France and Perle.

In reply to the inquiry by "T. K." about carrying over La France and Perle for next season in the benches they are now growing in would say that the best method I have ever found to treat such plants is: When the season for blooming is over this year or, in other words, when the demand for the roses warrants the discontinuance of cutting flowers from them, begin by withholding water slightly from them at first, giving all the air that is possible both night and day, gradually reducing the amount of water till the wood becomes fairly well ripened. This process will take from four to six weeks, then go through the plants, carefully pruning out all the small spurry wood, reducing the longer and strong shoots somewhat but still leaving plenty of green leaves on them to maintain the roots in a live active condition, then scrape off as much of the old soil from the surface as is practicable without destroying too many roots. When this is done mix some good fresh soil and manure, about four parts of soil to one part of manure, fill up the bench as full as it will hold, leveling it all off evenly; first be sure that the soil and manure are thoroughly well incorporated as it would be very much better to take well decomposed manure, not less than nine or ten months old, as green manure is not conducive to free action of the roots at once. When this is done start syringing overhead two or three times a day, gradually moistening the whole soil in the benches, but do not flood them till the eyes have started into active growth. By this time probably it would take from two to three weeks from the time of starting to get them into active growth, then they will take very liberal waterings and should never be allowed to get dry again, that is, not dust dry.

This, in all probability, would bring the season up to the end of September; presuming that you started to rest the plants the first of July it would be the middle to end of August before the pruning and surfacing could be carried out, so that it would make it the end of August virtually. This would mean, by the time the plants get into active growth, the middle or end of September, from this time on they will be in bearing condition and if properly cared for will produce fine heavy crops of flowers.

When the roots have thoroughly filled up the soil liberal applications of liquid will be of great benefit to them, in this latter case be very careful not to make it too strong and an application once in two weeks will be sufficient to carry them through and past the holidays, after that of course according to the strength of the plants so must be regulated the amount of food given to them, such as mulchings of manure, additional amounts of liquid, etc.

To carry old plants over in shallow benches requires a little care and good judgment, and where the soil is naturally good enough to do this they oftentimes will do very well and in fact do as much the second season as for the first, but it requires a little care and great attention and a little more labor. JOHN N. MAY.

Foreign Notes.

Marechal Neil rose blooms have been hawked about London streets this spring at a penny each.

The practice of throwing paper serpentines on trees in the boulevards prevails to such an extent in Paris that the removal of it has cost the city the past year 1700 francs.

A movement is on foot to revive the exhibition of laced florists' and garden pinks in London, and a show is projected for the week of June 11, to be held probably at the Royal Aquarium, Westminster.

A correspondent of the *Journal of Horticulture* complains that the English sparrow has been busying himself in cutting off the cherry blossoms. The blooms are seized by the calyx and plucked so that the whole flower is removed and dropped at once, the ground being covered with the blooms nipped off in the manner described. What has our friend W. R. Smith to say to this?

The London *Garden* says: "It appears that raisers of new cyclamens have really arrived at a stage when to attempt further advance in size of bloom or variety of coloring means a downward step. In a large group we saw lately, purples, magentas, and shades of the same objectionable colors predominated. Nothing is worse than a magenta-shaded cyclamen, especially when the flower gets a little past its best, as it dies off of quite an ashen tone. By striving after novelties of this kind the whole race is likely to become thoroughly spoilt. One only requires a few clear self kinds and in a good strain or selection many fine types may be picked out, rose, crimson, pure white, and others, all beautiful in color and form. Of recent years the Persian cyclamen has been greatly improved, not only in habit or growth, but in the flower itself, this being larger, more massive and borne on a sturdy stem."

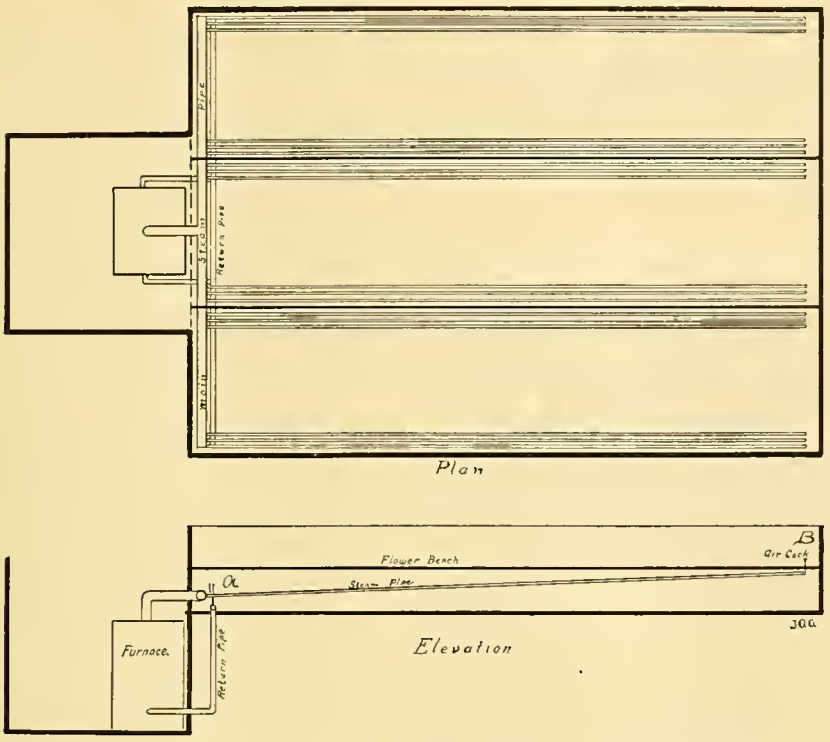
A correspondent of the *Journal of Horticulture* writes: "divide pyrethrums and make new beds is the somewhat loose advice given to readers of a provincial newspaper by some amateur correspondent. I should like to know on what experience that advice is based. My own is that no hardy plants divide so badly as do pyrethrums. In the trade nursery, where the work of propagating is performed with considerable success, the rule is to take off young shoots in the spring with pieces of root, if possible, attached; if not done as ordinary cuttings insert them singly into tiny pots, in sandy soil, root them in warmth, and thus increase stock. If the roots be lifted as above advised and be divided there is always the gravest danger that the young shoots will be severed from the roots, and thus can only be propagated as cuttings. Even when successfully divided the plants take a long time ere they get hold of the ground, often suffering much in drought because they are shallow rooted. Amateur gardeners could soon lose their stock in this way."

The Single Pipe System.

ED. AM. FLORIST: Judging from the number of letters of inquiry I have received about this one pipe system of heating there is evidently a great interest manifested in it, and as I cannot spare the time just now to answer all letters, as I should like, I thought a few remarks in your admirable paper would relieve me of considerable work that to me is harder than running greenhouses, and put the matter before the craft in a manner plainer and more comprehensive than replying to individual letters.

If the system has features about it that are better than the old plans of piping, then all ought to know it. There is no patent on it and all can try it. If you feel that a little more heat is needed in some house over head or under the bench tap one of your pipes and run a pipe where you want it, only give it a rise all the way with cap and air cock at the other end, and try it next winter. You don't have to change your whole system to try it, although that is not giving it a fair show like plan enclosed.

In this plan I have tried to make it appear plain so that any one can understand it. There are two ways to run the main flow pipe, up or down from boiler. I have them working both ways. In the up plan it is necessary to provide a drop pipe just after leaving the main to receive the condensed water returning from the small pipes and being connected with a return pipe run to bottom of boiler. If a pipe for over-head is needed put in a tee at any point, or a cross as per plan, at A. I think this up plan the best as it gives us dryer steam, but costs a little more for fittings. In the down plan the main falls from the boiler to its extreme end and is then connected at bottom with return pipe to boiler. All the pipes running from main in this case return their condensed water to main and it is carried along to end of main to return pipe. All pipes to rise from main enough to drain them of all water, and to be capped and air cock put in.



Under benches where it would be awkward to get at them I have small ¾ pieces of pipe to come through the benches with air cock on top, B, leaving space for expansion and contraction of pipe.

Many have inquired about size of pipe. Anything that you can use in any other system you can use in this. I am using lots of old 3-inch that I once used for hot water. Am also using lots of 1-inch. My preference however, if I was going to buy new pipe, would be 1½-inch to 2 inch.

It is understood that this whole system is regulated by the air cocks at end of pipes. If you don't want to use a house or a pipe keep the pipes closed. If you want to use one or two pipes, let the air out and they will soon be giving off heat, while the others along side will be cold. When pipes are in use I keep them open a little all the time. I prefer them to automatic valves as the latter fail to work after a little while. You will notice we have no large brass valves to open or shut or to pay for.

The only trouble with this system is it is so simple that people think it cannot work right, but I assure you after four years trial I have no desire to go back to the old system. THOS. FRANKS.

Champaign, Ill.

THE SINGLE PIPE SYSTEM OF HEATING GREENHOUSES AS USED BY MR. THOS. FRANKS, CHAMPAIGN, ILL

Miscellaneous Seasonable Hints.

As the season comes round some truisms will have to be repeated at the expense of being thought barren of new ideas. Don't let your fires out to save a little coal where you have coleus, cannas, acalypha and many other plants. And if you do let them out in your houses where you have geraniums, fuchsias, heliotrope and that class of stuff then leave plenty of ventilation on day and night. It is not the low temperature that will do harm to these plants, but the damp and unhealthy atmosphere which always occurs without fire heat when the house is shut closely down.

If there is a grain of goodness in overhead heating for rose and carnation houses all sane men must agree with me that for the cultivation of soft wooded plants on benches it is an unmitigated abomination. As I have three houses with the hot water pipes above the benches and a good many more heated in the good old fashioned way I know by dollars and cents whereof I speak.

Don't let your plants get crowded for the next three weeks. It will be the end of May before there will be much decrease in your stock of bedding plants, but there is no excuse for want of room now, even a cold frame now will take care of many plants better than a cold greenhouse, especially bedding geraniums, annuals, feverfew, etc. Stand them over for the last time and give ample room for them to develop their bottom leaves, instead of their turning yellow, and don't let them flower themselves to death before the time you want them to look their best. This is particularly true of the show pelargoniums. They won't stand any continued moisture on either flower or foliage.

It's about time now to fill hanging baskets. I believe in the style of basket used in this city, which is of wire lined with green moss, for reasons explained in my notes of last year, but whatever style you use be sure the soil is very rich. Some coarse bone dust is good; it tells on the end of the journey. The "vines" are the most essential part of a hanging basket. Different localities have different favorites; with us senecio, money vine, variegated glechoma, nasturtium, lobelia, vincas, variegated and green, ivy geranium, sedums, and several others are used. Common as these plants are they have the desired quality of growing and keeping green in the trying ordeal of a windy veranda. For middle plants there is nothing better than a good dwarf geranium, with some achyranthes and compact growing coleus. If the baskets are filled to order ask if they are to be exposed to the full rays of the sun, or in a shady situation, and then fill accordingly; the result will be satisfactory, and will redound to your credit and future business. You will be asked often how to water hanging baskets; tell them to let the hose run onto them or on them until they are thoroughly saturated, or even better, take them off the veranda on to the grass, where a good and sufficient watering can be given, but never let them be immersed in a tub for ten or fifteen minutes in perhaps nearly ice water. They are not aquatics, and will rebel against this treatment by simply giving up the ghost.

Hydrangeas that were not forced for Easter will soon be coming on in good style. They will sell better about the end of this month than at any other time. It will pay you to select a number of the best plants and put into 8, 9, or 10-inch pots. You will get a much advanced price over those starved in smaller pots, and will be far more satisfactory to the purchaser, who generally buys them for a plant to stand on the stoop or veranda. Hydrangeas are the grossest of all feeders, and should have a rich soil and solid potting.

Don't fret about your carnations being planted out until the 15th of this month. There is no time lost. Great big plants are not desired; a medium sized, healthy plant, is all you desire. Remember I am only referring to the florists of this latitude, but the same advice will extend over a considerable latitude.

Don't neglect, before you sell out all your stock, to plant out sufficient for your own use. You ought to have the best and healthiest of all if you wish to perpetuate a good vigorous stock of all kinds of bedding plants. Philosophers tell us there is no real reason why a plant should not be just as vigorous propagated from a cutting for many years as from a seed. There is no time or place to enter into that discussion in these notes, but depend upon it, in common practice they are wrong; and it behooves you to select only the very healthiest individuals of a variety or species if you wish to have that species with you in a healthy state. Propagation by cutting or layers is merely a multiplication of the individual. Seed alone can produce a true separate individual by nature's way.

A Subscriber want to know how to rid coleus of mealy bug. At this time of year, when they will soon be all planted out, good advice would be to get rid of all the mealy bug stock, and in the fall procure cuttings of absolutely clean plants, but if that is not practicable, you can with skillful syringing (while watering) rid them of mealy bug. They can't put up with a good cold bath applied with some force from a hose. An emulsion of kerosene is death to them, but coleus is very soft, and the danger is you can hurt them while you are killing the bugs. A quarter of a pint of kerosene in a pint of milk thoroughly stirred for a quarter of an hour and then added to 3 gallons of water is a cure for this pest. On cycads and palms you can use this without any fear of injury, but coleus are very soft.

The same Subscriber asks how he can hold chrysanthemums in 4-inch pots. There is no way of "holding" them; they must be shifted into larger pots, planted out on the benches, or the tops taken off and rooted, and the old plants thrown away. This is a good time to plant on benches in the best of soil, those flowers that you want extra fine results from. For the main crop of flowers wait another six weeks before planting, and for the ideal market plant the first of June is plenty of time to plant in on the benches. There is a broad rule which will stand good in chrysanthemum culture, which is, don't let them get "hard wooded;" keep them growing, and if you can't do this take off the cutting and throw the old plant away.

W. S.

The One Judge System.

Mr. Stewart is a little sarcastic—unnecessarily so it seems to me—in answering my simple request for an explanation as to how this system was un-American, and he has after all devoted very few words to the gist of the question. His letter clearly shows that he has given the subject very superficial consideration and that he is simply defending an assertion made at random. Perhaps this is hardly a suitable place to enter into an argument to prove that the one judge system is in perfect accord with the American constitution, but I should be quite willing to try and enlighten Mr. Stewart through private correspondence if he—a Bostonian—is not above receiving light from a simple Canadian.

Mr. Stewart is giving Toronto too much honor when he calls the one judge system the "Toronto plan." If he will turn up the AMERICAN FLORIST of October

29, page 268, he will find there a letter from Mr. W. T. Bell, of Franklin, Pa., strongly advocating this very system and stating that the secretary of a society in that state had told him, "We adopted the one judge plan several years ago and find it far superior to the three or more plan." It seems almost superfluous to say that the system originated neither with this society nor at Toronto.

I have a very strong impression that a *large* proportion of those interested in exhibitions in America had adopted the "Toronto plan" before Mr. Bell's letter was written or have done so since.

To come down to plain, practical experience—an ounce of it is worth a ton of simple assertions supported only by sarcastic inuendoes—I say that the one judge system has proved itself over and over again to be more satisfactory to exhibitors. It is all very well in theory to say that the wisdom of three men must be greater than the wisdom of one, but unfortunately for this theory—as in the case of many others—it is not a necessary sequence in practice that the judgment of three men is any better nor indeed always as good as the judgment of one. And in the case of "duffers" (by which term I mean men who do not thoroughly understand the work in hand; I should have remembered that it is not customary in Boston society to use slang words) the ignorance of two men will over-rule the wisdom of one, and the ignorance of one will often result in a compromise—not a correct judgment.

I admit that the responsibility of the one judge is great and it is necessary that he be a thorough expert, but thanks to the great advance horticulture has made lately there are now plenty of good men to be obtained who are willing to "face the music" (more horrid slang) in the interests of horticulture. A thorough expert will not be afraid to assume the responsibility, but it will be better for his own interests not to judge in his own city.

Of course in the one judge system it is not essential that the same man should judge everything in the show, there may be one for plants, one for cut flowers and another for designs, or one for every class for the matter of that, but it is essential that every *section* should be judged by one man.

I don't wish it to be understood that I am defending the World's Fair system of judging, which was a complicated combination of the one judge system and some other system which it is doubtful if John Boyd Thacher himself understood. From all I have been able to gather the exhibitors would have been better satisfied if the latter part of the combination had been left out altogether. I think that the exhibitors in the classes judged by Mr. Nicholson, of Kew Gardens, will agree that no three judges could have given better judgments than he did, but were the awards given according to his judgments? I have had very little information on this point and am not hinting at any crooked work, but I say that if the one judge system had been adopted—in the Floricultural Department at least—at the World's Fair exhibitors would have been better pleased with the results.

Mr. Stewart says in his essay that this is a subject which all the Florists' Clubs and Horticultural Societies should seriously consider. I am of opinion that most if not all the clubs and societies have already done so and that after such consideration the large majority of them have arrived at the conclusion that one judge gives more satisfaction to exhibitors generally than three. At any rate until much more potent arguments than Mr. Stewart has advanced the clubs and societies may rest happy in the belief that the one judge system properly carried out is *not* un-American in principle, whatever other faults it may possess.

A. H. EWING.

Toronto, May 5, 1894.

Boston.

At the May meeting of the Gardeners' and Florists' Club the announcement that Mr. Wm. Scott of Buffalo would read a paper before the club brought out a large attendance, many of those present being personally acquainted with the essayist and all knowing him well through his instructive notes in the AMERICAN FLORIST.

The routine business having been disposed of, President Welch introduced Mr. Scott, who was accorded a most flattering reception, and after a few introductory words proceeded to read his paper on "Specialties in the Business," which we present in full in another column. The subject was calculated to excite considerable discussion on the various points touched, and the announcement by the President after the close of the lecture that the essayist would now be pleased to answer any questions which might be propounded to him was the signal for a regular battery of conundrums which kept Mr. Scott busy for the next hour and occasioned some pretty lively talking from the floor.

Mr. M. H. Norton started the ball by asking Mr. Scott whether he believed it right for wholesale dealers to supply retail orders, a subject upon which Mr. Norton has had a grievance for lo, these many years. Mr. Scott said that they had only one wholesaler in Buffalo but that if they found him touching retail business they would barricade his door and turn him out of the town. This reply apparently gave extreme satisfaction to Mr. Norton and his sympathizers, but a counter suggestion by a member on the floor as to the just deserts of a retailer who would seek to do wholesale trade or who ignoring the wholesaler should secure supplies from private gardeners, apparently frightened the hen off the nest and the matter was dropped abruptly.

Mr. Warren Ewell then asked Mr. Scott's opinion regarding the sale of plants at auction. Mr. Scott replied that he had been once of the opinion that the auction business was deleterious to the trade at large but he had changed his opinion and now believes this to be a useful medium for the disposition of stock and one that should be upheld. Mr. Winfried Rolker who was present agreed with the speaker and advocated the auction as the best means for the disposition of fall bulbs. He believed that it would be well if this method should take the place of the present system of soliciting advance orders in spring, provided high grade bulbs were thus handled and an effort made to disabuse buyers of the impression now existing that the auction is only used to unload over-stocked or inferior goods.

Jackson Dawson took exception to the views expressed by the essayist on the subject of specialties and inquired where the all-round gardeners would come from to produce the elegant plants found in fine private collections if all the young men were to confine their efforts to the mastery of a single specialty. To which Mr. Scott responded that there is not one private place in Buffalo extensive enough to employ one first-class gardener, and Sam. Coleman with characteristic bluntness remarked that the best inducement offered to a young private gardener to-day is that he may hope to earn coachman's wages.

Mr. Dawson next sprung the question as to the wisdom of the importation of plants that can be grown in this country and incidentally referred to the injury done to the trade by the selling of imported stock such as budded roses, etc., by the dry goods houses at starvation prices. The general opinion on this subject seemed to be that there is in this country every requisite of climate, soil, etc., for the production of all plants and bulbs needed by the American trade but that the great drawback in American competition with the foreign producer lies in the cost of labor.

A motion offered by Mr. Hatch thanking Mr. Scott "for his patience and kindness in listening to all they had got to say" was adopted. The American Florist Co. was also thanked for the gift of a copy of the Directory of florists, nurserymen and seedsmen.

Resolutions of respect to the memory of the late M. A. Hunt and extending the sympathy of the club to his bereaved family were unanimously adopted. In accordance with the new program the club will not meet again until September.

The pansies at D. Zirngiebel's are well worth a visit this spring. They are finer, if possible, than ever before. Each season seems to develop brighter colors and new combinations. Mr. Zirngiebel buys the finest seed he can procure, constantly, and if anything superior is found in them the new blood is introduced into his stock, and this together with incessant care is the secret of his success. The extra fancy strains are so finely bred, however, that anyone buying them for bedding out purposes will be disappointed in the results. They must have protection from wind and weather, but they fully repay any care that can possibly be bestowed upon them.

The cut flower trade has been about as dull as it could be since May came in. All kinds of stock are very plentiful. Outdoor flowers are considerably ahead of the average blooming time and it will take some steady cold weather to hold back the usual Decoration Day reliables for that occasion.

The Public Garden is gay with hyacinths, tulips and narcissi and pansies, daisies and myosotis are now at their best. The slopes of the Back Bay Fens are bright with wild violets and ground phloxes and great masses of forsythias and spiræas make a glorious show.

A sad accident occurred on Saturday at the residence of Prof. Watson at the Bussey Institute whereby a girl of 19, employed as a domestic, lost her life. Her clothing took fire from a match while she was lighting the gas and she was fatally burned before help reached her.

J. C. Hovey, the seedsman, well known as the son of the late P. Brown Hovey, of the old firm of Hovey & Co., died on May 1 after a long illness. He was a member of the Mass. Horticultural Society and has served on several of its important committees.

Visiting Boston: J. A. Fraser, representing Wm. Hagemann, Philadelphia; S. Skidelski, for E. Kaufmann, Phila.; H. S. Van Waverin, for Segers Bros., Holland; Wm. Scott, Buffalo; O. J. Dorn, Syracuse; Winfried Rolker, New York; Burt Eddy, Chicago.

The May exhibition of the Massachusetts Horticultural Society was held in their hall Saturday, May 5th, and brought out a very beautiful display of plants and

flowers. Calceolarias were shown by John L. Gardner, D. F. Roy, gardener to E. S. Converse, and W. F. Gregory. The plants were very fine, the former capturing the first prize for the best six plants and Mr. Roy first for specimen. Messrs. Norton Bros. showed two large handsome plants of Hydrangea Otaksa and a beautiful plant of Dendrobium thyrsiflorum. Tulips and narcissus were exhibited by John L. Gardner, R. & J. Farquhar & Co. and Bussey Institution and the latter also made a fine display of ixias and flowering shrubs. John L. Gardener also made a display of stove and greenhouse plants containing three very fine ericas, Cavendishi, tincta alba, and magnifica. Denys Zirnigiebel and Joseph S. Fay made displays of pansies, the former taking both first and second premiums.

The collections of wild flowers made by George H. Grinnell, Mrs. P. D. Richards, Eleanor and Mollie Doran, and Mary E. Loud, contained many rare specimens and attracted a great deal of attention, as did the displays of cut flowers shown by Francis Brown Hayes, Mrs. E. M. Gill and Mrs. A. D. Wood. Two beautiful vases of carnations Nicholson and Ada Byron were shown by Wm. Nicholson. Jackson Dawson exhibited two new beautiful shrubs, Prunus spinosus fl. pl. and Spiræa angusta which were awarded first-class certificates of merit. The latter is a valuable acquisition, very early, perfectly hardy and superior in foliage and flower to Spiræa Thunbergii.

Andy.

Anybody at all familiar with Horticultural Hall in Boston knows Andy, who has been a faithful and obliging attendant there for the past twenty years and has made himself as indispensable almost as the building itself. Andy's full name is Anthony Riley. He was born a slave on the plantation of Robert E. Lee, in Virginia. It is quite interesting and amusing as well to hear him relate how when in camp with General Lee in 1862 he sloped off at night with one of the General's best horses and made tracks for the Union Army. Andy lacks but a few months of being sixty years old although he does not look it. He is brim full of fun and a great favorite with the boys, for whom he is always ready to go any length to do a service.

Philadelphia.

The first auction sale of the big four, Messrs. Harris, Craig, Burton and Lonsdale, will be held at August Rolker & Sons' rooms in New York the coming week. The stock to be offered is first-class in every respect, and no doubt the returns will be found very satisfactory. These gentlemen have established a reputation by the excellent stock sent to previous sales that always insures them a good class of bidders, willing to pay remunerative prices.

Those who make a specialty of bedding plants are now very busy; their houses are full of spring stock which is in most cases in perfect condition. Jacob Becker of 53d and Market has a very fine stock of pot roses, all marketable and in very fine condition. All the roses that are forced for cut flowers during the early fall and winter are potted up about the middle of January and after being kept cool for a month or so are then given more heat and when the time for planting arrives they are in fine condition and better than dormant stock of the same kind potted up in the fall. His stock this season consisted of over 25,000 plants in 5 to 7-inch pots. Prices for this stock run from $3 to $6 per dozen. Geo. Uber of 55th, near Woodland avenue, is very strong in geraniums and his 6-inch stock is the best we have ever seen. They are a good size, carrying from 3 to 6 large flowers and a lot of buds. Most of the geraniums for this market are grown in 4-inch pots and sell for from $7 to $8 per hundred. Some of the smaller growers sell their own product four for a quarter.

"ANDY," MAJOR DOMO OF HORTICULTURAL HALL, BOSTON.

We imagine it would take a magnifying glass to find the profits.

About 15 years ago the first organization of the trade grew out of an effort of the growers to fix the wholesale price of 4-inch pot geraniums at $10 per hundred. They could not be grown for less, at least this was the opinion at that time, and we believe that there has never been a meeting so numerously attended by members of the trade in this city before or since. It was an honest effort to establish a small margin of profit on a very staple plant, but it failed, and for years $8 per hundred has been the price. Those grown in 5-inch pots bring $10 to $12 per hundred, and 6-inch stock sells for from $16 to $20. Verbenas, petunias and all small flowering bedding plants bring from $3.50 to $4 per hundred, and the same may be said to be the price for coleus, alternanthera and all such plants for carpet work, although the latter class have been sold out of 2 or 2½-inch pots as low as $2.50 to $3 by the thousand lots. Griffen Brothers of Frankford have a very fine lot of bedding plants and one of the best in variety. The retail store men do not do much in plants, as at the very small margin the street dealers seem to be willing to take there is little or no profit when those that go to waste are counted up.

The cut flower business is falling off very rapidly, last week being remarkably dull. Prices of flowers have dropped in consequence and stock of almost all kinds can be had in quantity at the buyer's price. Outside valley is now in and while it lasts the price of this flower will be low. Sweet peas are very abundant and carnations can be bought for $5 or even less per thousand, the fancies being $2.

The fakirs have had a busy week, giving a goodly portion of their stands and baskets to lilac, which has been both plentiful and fine. Violets, both cultivated and native, are done.

The smaller tea roses are now to be had for from $1.50 to $3 per hundred, the larger stock, such as La France, Mermet, Bride, etc., bringing $3 to $5. All large quantity lots go at from one-half to two-thirds less. Beauties are fine and the best sell for $3; Jacqs, $12 to $15.

The last meeting of the Florists' Club was well attended and all listened with great interest to Mr. J. Westcott's remarks on how best to entertain the visitors next summer. There is one thing certain—that anyone who attends the convention will be made to feel glad he came. If half of the good things materialize that are promised for the meeting at Atlantic City next August, those who stay at home will never forgive themselves.

Appropriate resolutions were adopted on the death of Mr. M. A. Hunt, whose untimely death called forth deep expressions of sorrow and sympathy for his family:

There is a plan on foot to enlarge the membership of the club by having an associate membership composed of others than those engaged in the trade. Quite a number of persons have applied for admission who were refused on account of a clause in the constitution which says that members must be closely identified with the business, must either be florists or dealers in florists' supplies. The new members are to enjoy all the privileges of the club room, but are to have no voice in the management. K.

New York.

There is an excessive supply of flowers and trade continues very dull. Roses are still overstocked but there are indications that the supply will soon decrease, and much of the stock shows the weakening effect of the hot weather. A few good ones bring a fair price but the balance has to be sold very cheap by the thousand. Jacqs when good are in fair demand but large hybrids and American Beauty sell poorly.

Carnations are very plentiful. White and the extra fancy varieties are the only kinds for which there is any call. Sweet peas, with the exception of the white ones, are getting plentiful and the prices are down. For novelties there are a few corn flowers and white and purple campanulas coming in which sell well because they are few. Some splendid Cattleya Mossiæ and Lælia purpurata are to be had. These come from Julius Foehrs.

Wagon loads of outdoor lilac, Narcissus poeticus and lily of the valley are coming in every morning and these with apple blossoms and other outdoor bloom serve to make the florists' windows attractive with but small expense. Violets, tulips and daffodils have come to the end of their engagement and will appear no more until next fall.

Many of the clerks in the wholesale places where many roses are handled have taken to wearing kid gloves at their

work. This is not an indication of any new development of dudeism but is done as a precaution against sore fingers. There appears to be an unusual amount of that trouble this spring, resulting from thorn pricks and aggravated as many believe by some of the preparations used on the plants by the growers as fertilizers or insecticides.

There have been numerous recent changes of business locations. F. D. Hunter has moved across 30th street and his address will hereafter be No. 55. Millang Bros. have given up their store on 28th street and will henceforth make their headquarters at the 34th street flower market, where they have fitted up a fine establishment with large refrigerators and other conveniences, and the rooms will hereafter be open all day. It is understood that H. W. Baylis will soon move from his Broadway location to the store on 28th street vacated by Millang Bros. Mr. Dick Young has given up his venture on Sixth avenue and his smiling countenance may now be seen as of yore at the 30th street establishment of his brother John.

But the most notable business change has been the abandonment by "George the Greek" of his Broadway store. He found that something besides a mere store on Broadway is necessary to catch the fashionable trade of the tenderloin district, and that street fakir methods are not acceptable outside of certain neighborhoods. Much solicitude was expressed by thinking people at the time of Mr. Preamus' bold break lest it might be the entering wedge which would in time injuriously effect and break down the dignity and standing of the florist business, and it is with much satisfaction that they see the dangerous attempt abandoned.

Ernst Asmus was taken with a severe attack of fishing rod fever last week. On his return from the trout brooks of Dutchess county he will doubtless be feeling much better.

I. Forsterman has been in poor health this spring and contemplates a trip to Europe in a short time.

The C. F. Wenderoth, formerly of Avenue C, mentioned in our last issue, is in no way related to Fred B. Wenderoth, with Ed. Jansen.

Buffalo.

Your correspondent has been away in the beautiful city of Boston this past week and has scarcely had time to ask the fraternity what they are doing. There are no big parties or high toned weddings going, of that I am sure, and business can be called only fair. Outside flowers begin to cut a prominent figure in the stores and market. Roses are beginning to show the usual decrease in size and the carnations are plentiful but not as good in quality as they were two months ago. Good violets are still coming in plentifully from Corfu and other villages in Genesee county.

Plant trade seems to be opening up early this year and the uninformed are ready to buy geraniums and other tender plants for their garden until warned by the conscientious Buffalo florist that "it is not yet safe for a week or two."

The Buffalo Park flower gardening will I hear be a great improvement on former years. They have had plenty of time and plenty of stock to get up a good collection and this year perhaps the flower beds will compare favorably with those of other cities. Flower gardening, while perhaps not an absolute necessity in a public park like ours, is almost an essential, especially to please a class of citizens who compose the great majority of our people, and whose limited education does not allow them to see as much beauty in a well assorted group of flowering shrubs as in a bed of scarlet geraniums. It is just as proper to cater to this large innocent class as it is to be produce features which can only be enjoyed by the favored few whose fast nag speeding on beautiful driveways allows them to see the whole park system in a day. If artistic flower gardening is attempted in our parks on any scale it should be well done or entirely left alone or it is only a reproach to the management. Ragged beds of marigolds, zinnias and other annuals are hardly good enough to satisfy even the uneducated taste. The park greenhouses, situated at West Seneca close to the city line, are well taken care of by Mr. Simpson, who is a thorough all round gardener.

The Botanic Garden is now an assured fact and while road making and other heavy work will be pushed to completion a good deal will be done before fall toward getting the garden under way. A large collection cannot be got together in a day but this is the beginning of what some day may be one of Buffalo's best known institutions. It will gratify all his many friends here, as well as the hundreds in the profession in other parts of the country, to know that Professor John F. Cowell has received the appointment of superintendent or director of the Botanic Garden. It would have been impossible to find a more suitable man for the place even if the continent had been searched. Mr. Cowell is a thorough botanist and has the advantage of an early horticultural training in New England. His knowledge is not confined to hardy trees or shrubs, neither is it limited to florists' flowers or aquatics or grasses or orchids or palms. He loves and knows them all.

Among the visitors this past week was that very lively young man Mr. J. Blaauw, of Boskoop. He jumps round you so lively that the first thing you know he has a good sized order.

I have just parted with a gentleman from Bristol, England, Mr. J. Henshaw, a brother of the well known Samuel Henshaw. Mr. H. is making a flying visit through the county and seems impressed with its size if nothing else. He had yet to see the Falls and *Chicago*.

I should be ungrateful were I not to acknowledge the great hospitality extended to me by half a dozen of the shining lights of Boston last week. It is truly the hub in many ways. I did not taste a bean there, but I had been there before. Talk about a park system. When that gets completed our other big cities will have to get a big move on them or they will be very much in the rear. The display of tulips and other bulbous flowers in the public gardens is beyond belief and the first cost of them would beggar the entire park fund of some smaller cities.

At the regular meeting of the Buffalo Florists' Club resolutions were adopted expressing great sorrow by the members on the death of Mr. Myron A. Hunt. Many members that knew him personally spoke most feelingly, and considered his death a national loss. W. S.

CINCINNATI.—On May 5 the new mayor was installed in office and the floral designs presented by his many friends made trade brisk for a while. The retiring mayor was also bountifully remembered which was equally acceptable to the florists.

Chicago.

Last Saturday Governor Altgeld issued an order removing President Waller of the Board of Commissioners of Lincoln Park. The order, which was printed in full by the daily press, was a long, windy document, in line with the Governor's previous effusions of the same sort. If any evidence were needed of his entire ignorance of park affairs this letter would be more than sufficient. He again announces his intention to force the appointment to the superintendency of an engineer rather than a horticulturist. As soon as he has appointed a successor to Mr. Waller (he has already appointed the successors of Messrs. Heuer and Kirk) the board will of course reorganize and as each new appointee has undoubtedly accepted under pledge to carry out the governor's ideas, one of its first actions will of course be the appointment of an "engineer" as superintendent. That this party will be a "political engineer," as one of the dailies puts it, there can be little doubt. The power of the governor is absolute under the law and there seems to be no hope for the park until his term of office expires two years hence. He has also got the affairs of the West Park Board into a similar unpleasant condition. The South Park Commissioners fortunately cannot be interfered with as they are appointed by the judges of the superior court, and not by the governor.

The market last week didn't show much improvement. Although the glut of stock was not quite so great, prices showed little improvement. Assorted roses in quantities still went as low as $15 per 1000, but selected grades were a little more settled. Meteor and La France brought $3, Mermets, Brides, Perles, Duchess and Wootton's $2. A few fine Testouts are sent in, selling at $5 to $6.

Beauties have the field again to themselves in the larger class of roses, hybrids being all cut out; the latter, however, seemed to have but little affect on the market at any time. The popularity of the Beauty has carried it through the entire season without a break in prices. First-class, long stemmed stock still brings from $2.50 to $3 per dozen.

Carnations have stiffened up again, good commons selling at 75 cents; disbudded, extra fine, selling at from $1 to $1.50; and fancy sorts going as high as $2.50. Some very fine Buttercups are noted at present. Daybreak is still good, but somewhat paler in color. Outdoor grown valley is coming in in large quantities but sells very slow at $1. There is little or no demand for outdoor grown tulips, daffs, narcissus, etc. Even Parrot tulips, which have always been great favorites with flower buyers, find little demand.

Retail men report a very quiet business.

M. Enders, of Havelock, had an urgent call to leave the city. Numerous creditors who hold unsettled accounts against Mr. Enders to the amount of $3,500 would like know his whereabouts.

Mr. P. Koster, of Koster & Co., Boskoop, Holland, was a recent visitor.

Baltimore.

The cut flower trade is decreasing daily, but the sales of plants are increasing in inverse proportion and the poor florist man still manages to keep his head above water in spite of the fact that an armful of lilacs can be bought in market for five cents, that almost every drug and dry goods store has its box of flower seed, and some their plant counter also, and

by no means least the fact that here and there a wealthy amateur puts his surplus bloom on the market when it becomes plenty "just to keep it from going to waste, you know." If "There's a sweet little cherub that sits up aloft to keep watch for the life of poor Jack" there must surely be another to care for the dealer and worker in the houses of glass, else why do things turn out so fortunately? The hardest times occur during the mildest winter; the dull season is when expenses are lightest; the amateur competitor appears when the season is nearly over; and so on through the list.

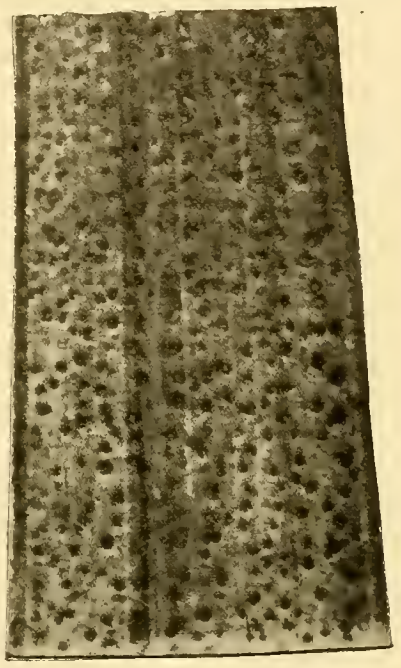
The season is well advanced here; some little bedding out, mostly of geraniums, is being done, and most shade trees are in full leaf.

A walk through the establishment of one of our pioneer florists, Mr. Jas. Pentland, recently proved that there is still a camellia man in the trade, for the hundreds, yes thousands of camellias at his place embrace apparently every desirable variety known, and though the season is practically over yet enough bloom was to be seen here and there to call forth interesting talks from Mr. P. as he passed along. The stock of roses and miscellaneous plants was in fine condition, but the camellias predominated.

Now comes the time for the club members to experiment with red spider. There has been some sharp debates on the little vagabond and once or twice the red insect was about as provocative of belligerency as a red flag is popularly supposed to be. One member at a recent meeting said: "I believe they are scavengers and feed on excrement from the leaves. No plant in perfect health will have them. They only appear when the pores of the leaves have been closed, and the work they do is to remove the dirt, or, if the plant is in a condition to become very sick, defoliate it, and give it a period of rest in which to recuperate." It is needless to say that such a radical view drew the fire of several critics instanter, and a most interesting and amusing debate followed, in the course of which it appeared that spider had been seen by members out of doors on such vigorous subjects as tree box and large lindens, with no apparent excuse for their presence except dry weather and near by greenhouses.

Mr. M. A. Hantske has left the store, 1614 N. Charles street.

Roses are very plentiful and cheap, but off in quality. Valley and all outside stuff is in more or less of a glut. Sweet peas plentiful at one and a half cents.



MACK.

A Palm Leaf Blight.

Specimens of a palm leaf disease have been received from a large grower of ornamental plants with the statement that much damage was being done to his stock. The leaves and particularly the upper portions lose their green color and take on a gray appearance soon to be followed by small dark pimples. These pimples are quite evenly distributed and bear innumerable spores. A photograph was taken of a portion of one of these leaves at the same time enlarging the parts six times. The accompanying engraving made from the photograph therefore shows the leaf and the pimples upon it equally magnified. By means of this an idea is obtained of the great number of the spore-bearing spots, and their quite uniform distribution.

It of course follows that an infested leaf like this should be removed and burned, for there is no cure for it, and it only serves to propagate the parasite. It might be said in passing that if gardeners and crop growers generally could see through the microscope the enemies of their plants they would be all the more anxious to eradicate them.

Palm growers sometimes cut off the foliage of their plants below the blighted parts, but not cutting far enough below the line of disease it again appears so that palms are often seen with leaves half cut away and yet not free from the blight. This experience only teaches that the fungus is quite widely distributed within the plant, and is feeding in the apparently healthy tissue before observed from the outside.

PALM LEAF BLIGHT.

The fungus in question is a member of the genus Phyllosticta and belongs therefore to a group of parasites widely known for their destructive tendencies. They may be held in check by using the standard fungicides provided they are employed in time.

BYRON D. HALSTED.

N. J. Exp. Station, New Brunswick, N. J.

Cleveland.

Owing to the tightness of money and the continued labor troubles business has been moving slowly this spring in all lines of trade and especially so in the florists. We all hoped for things to brighten up after Easter and make amends for the dull winter that we passed through, but our books show that the average business done is below that of last year at this time. Flowers were never offered at so low a price, and the quality is first-class, better than usual at this season of the year.

One of our wholesalers has opened a large stand in the central market, where they have an attractive display card quoting "roses 35 cents per dozen," and the best roses at that. Is it any wonder that there is complaint of the store men on the avenue who buy from this same party and pay three dollars per hundred for the same class of roses?

J. M. Gasser has opened a branch store at the East End where he is also offering his surplus stock at lower prices than at his down town store.

The Hollanders received the cold shoulder in our city this spring, as none of the bulb growers for the Cleveland market made any money the past season, indeed it is doubtful if they came out even.

The Wamelink Bros. have the neatest window display of all the florists. Chas. Wagner is their efficient manager.

Mrs. Wilson, of Jennings avenue, had the most elaborate decoration of the season lately at the Hollenden. The occasion was a banquet given by the Board of Trade.

We all think the illustrations in the AMERICAN FLORIST of the flowers sent to the funeral of M. A. Hunt as near perfect as it is possible to make them, and think it is deserving of a compliment.

L. F. D.

News Notes.

TEXARKANA, ARK.—A severe hail storm on April 30 did much damage to the greenhouses and stock of M. S. Stegall.

LOUISVILLE, KY.—A effort will be made to arrange for a chrysanthemum show here this fall but date is not yet decided upon.

HARTFORD CITY, IND.—S. Humfeld and Wm. Worner have gone into business here at 18 West Main street, using the title Hartford City Floral Co.

ST. JOSEPH, MO.—Mr. and Mrs. L. J. Stuppy suffered a sad loss in the death of their youngest child, a bright boy of five years; burial took place May 3.

CEDAR RAPIDS, IOWA.—W. Waterhouse has just contracted with the Moninger Company, of Chicago, to put up two 100-foot greenhouses with the short span to the south.

LOUISVILLE, KY.—Cut flower business has been dull for some time but is picking up again. There is an abundance of roses and other flowers. The greenhouses and plants of the late A. Lauer were sold at auction May 8.

NICKERSON, KANS.—We are having rain in showers about 12 to 14 hours apart and all vegetation is in a flourishing condition. We could not have arranged it better if we had been able to turn the water on and off at pleasure.

MARION, O.—Easter trade was as good as could be expected. Cut flowers sold out clean, mostly in small orders. The trade in plants was fair, those offered at 25 cents or less selling best. It was difficult to find customers for fine azaleas, genistas or lilies, even at much reduced rates.

VAN WERT, O.—The Woodland Greenhouses have been purchased by a new firm, Wagoner & Wagoner, who have named the place "Van Wert Greenhouses." They start with about 18,000 feet of glass. A. J. Wagoner, manager. Will grow fancy cut flowers for wholesale market.

IOWA CITY, IOWA.—A terrible hail storm struck this town the afternoon of May 5 and did much damage. Jas. Aldous & Co. lost about $1500 in glass and plants. The hail averaged about the size of walnuts, and some were three inches in diameter. In some cases the hail punched holes in tin roofs. In places the hail lay on the ground three inches deep.

NYACK, N. Y.—The greenhouses of Jacob Mendel have been leased for a term of years to Messrs. Gustave Rummler and Conrad Walz. Both gentlemen are expert florists, and for many years held important positions in Minneapolis, Minn., where they are well known and have many friends who wish them success.

PARKERSBURG, W. Va.—Trade has been brisk here ever since March and the outlook is excellent for a good spring business. The excellent address delivered by Mr. Adolph Hiehle, the florist, at the organization of the State Horticultural Society recently, has been printed in full by a local paper. Mr. Hiehle made an earnest plea for unity and thoroughness in the work of extending the beneficial influences of horticulture throughout the state. The address was so well received and appreciated that he was afterward elected president of the new society.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By young man, age 26, as assistant in greenhouses. References.
Box 66, Maywood, Ill.

SITUATION WANTED—By young woman to learn general greenhouse work; Wisconsin or neighboring states preferred. Address
MISS MIRIAM JEWETT, Sparta, Wis.

SITUATION WANTED—By a married man, German, age 27, at a private or commercial place. Address H. FLEISSHAUER,
care J. M. Keller, Bay Ridge, L. I., N. Y.

SITUATION WANTED—As working foreman on commercial place, well up in growing roses, carnations and general florist stock; age 37, married. Good references. State wages. Address
J. R. care American Florist, Chicago.

The Advertising Department of the AMERICAN FLORIST is for Florists, Seedsmen, and dealers in wares pertaining to those lines ONLY. Please to remembe it.

Orders for less than one-half inch space not accepted.

Advertisements must reach us by Monday to secure insertion in the issue for the following Thursday.

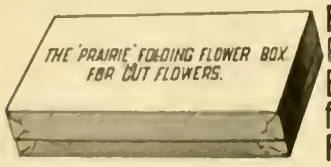
Address THE AMERICAN FLORIST CO., Chicago.

L. K.—"Double" callas are not very rare. We have made numerous notes of such abnormal flowers in past issues of the FLORIST. Flowers have been sent us with as many as three spathes.

THE REPORT of the Missouri Botanical Garden for 1893, recently received by us, contains copious information of the garden itself, in addition to scientific papers by Prof. Trelease and others. Those planting for effect will find the tables giving time and duration of flower and foliation of a variety of outdoor plants extremely suggestive.

DO YOU WANT the census statistics regarding the florist, nursery and seed trades? You will find them in our trade directory and reference book for 1894. Price $2.00.

YOU CAN never invest $2 to better advantage than in a copy of our trade directory and reference book.



NOTICE.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

MR. ALFRED UNGER, of L. Boehmer & Co., Yokohama, Japan, sailed May 4 for San Francisco, on a business trip through the U. S.

THE FARMER SEED CO. have removed from West Van Buren street, Chicago to Faribault, Minn., where they have just erected a three story warehouse with all the conveniences for handling farm seed and potatoes. Their extensive trade in northern grown seeds with the western farmers seemed to demand this charge.

Lilies from Bermuda.

We learn from a letter addressed to a Philadelphia gentleman by one of the Bermuda growers who shipped flowers here for Easter, that "The experiment is not likely to be tried again for the reason that it does not pay." Our correspondent adds that in the recent shipments the receipts did not pay the expenses.

Tobacco Stems as a Fertilizer.

Has any reader of the FLORIST ever used tobacco stems as a fertilizer? If so, how were they used, and what were the results? Market gardeners here use them to some extent. We would like to know the results of using them as a fertilizer for florists' plants. SALTER BROS.
Rochester, N. Y.

Minneapolis, Minn.

The park board has contracted for bedding plants for this season's planting at the following rates per 100: Coleus and alternanthera $1 to $1.75, thyme $2, geraniums of standard varieties in 4-inch pots $4 to $5, fuchsias in 4 inch pots $5, cannas of blooming varieties with four leaves $5, pyrethrums in 4-inch pots $4, pansies 75 cents to $1, echeverias $1.50 to $2. Prices of other plants are equally low.

The question arises whether plants can be profitably grown for such prices. If not, what is the sense of competing for the business? W. R.

DO YOU WANT a list of firms in the trade that issue catalogues, with key showing proportion of space given each branch of the trade in same? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

St. Louis.

The market trade in plants has improved during the past week, prices remaining about the same. In cut flowers there has been a falling off in demand; several days towards the end of the week can be characterized as very dull. Good long stemmed Beauties have been wholesaling all the way from 15 to 25 cents, and other stock in proportion. The shipping still continues good and promises to continue so during the remainder of the season; this branch of trade is expected to hold its own with last season's sales.

The Director and Board of Trustees of the Missouri Botanical Gardens have decided to erect a greenhouse 90x20 feet, equal span, running east and west, for the growing of stove and greenhouse plants; it is to be divided into sections by partitions, and so piped that any desired temperature can be carried in the various sections independent of each other. The construction is to be modern in every respect, and the contract has been awarded to the firm of Thompson, Anderson & Kennedy, the house to be finished by July 1st.

Mr. Dunford, since his return from the East, has secured a tract of land embracing 24 acres, at Lackland Station, St. Louis county, and will shortly commence the erection of a 250 foot house for the growing of cut roses for the wholesale trade.

In speaking to President Jordan of the Hail Association regarding the position of that body in reference to the death of its treasurer, he stated that there was nothing in the constitution and by-laws that would provide for the appointment of a successor. He has had therefore to fall upon general custom, which provides and allows the highest official of a society to fill vacancies, and after consultation with several prominent members has appointed Mr. Esler treasurer until a successor to Mr. Hunt be elected. In the meantime the assessment that has been ordered paid can be forwarded either to Mr. Jordan or Mr. Esler, who will receipt for same. R. F. T.

IN THE April 15 issue of *Gardening*, Chicago, appears an excellent article on greenhouse building, giving a very full and complete description of the F. R Pierson Co's. range of modern houses at Scarborough, N. Y. The illustrations include a general view of the range, plan of same, a section of one of the houses and detail drawings showing construction of the benches and the new method of joining the glass at the eaves.

DO YOU WANT a complete alphabetical list of carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

THE New York *Recorder* of April 15 prints an illustrated article descriptive of violet growing as carried on by Chas. Withington at Kingston, N. J.

THE BEST CHRYSANTHEMUM

We have ever sent out is our Novelty for 1894, named

PITCHER & MANDA (1500)

Any Florist when he sees it this fall in bloom, if he has not a stock of it will regret he did not procure it. It is of fine habit, free grower and stout stem; flowers very large, of great substance and lasting qualities. Color pure canary yellow with the exception of the outer five or six rows of petals which are pure white. The halo and soft blending is most pleasing and effective, and those who saw it in bloom last season regarded it as the most beautiful variety in our collection. It was awarded four first prizes and certificates of merit. As we had but a few blooms of it we were unable to exhibit it except in a very limited way. The price at which it is offered is a great break in this direction and in line with the general policy of the present management to offer only stock of the highest quality and at the lowest price. It will prove one of the most valuable Florist and Exhibition flowers ever introduced. We recommend it without reserve as the greatest Novelty of 1894, and those who have not already secured a stock of it should not fail to do so at once, as this variety is sure to meet with great favor. It has not been weakened by over-propagation by us this season, and nice plants will be delivered.

Price, 35c. each; $3.50 per doz.; $25 per 100.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

Toronto.

There is very little news concerning the horticultural world to be got hold of these days. Spring is such a short season in this country. In the old country there are three or four months in which to do the work that has to be rushed through in less than two here and it is possible for gardeners to chat with their fellow tradesmen now and then, but in Canada at this season it is nothing but work, work, work. There is plenty of time for chatting in the winter however.

The weather still keeps fine and mild with an occasional shower and vegetation is about two weeks ahead of last year.

The Toronto Gardeners' and Florists' Association desires to return thanks to the American Florist Co. for copies of the new trade directory; the secretary says it will be most useful to him, especially about chrysanthemum show time.

Gardens are looking very gay now. Hyacinths and tulips are in the zenith of their glory.

Herbaceous plants are gaining ground in this city. The gardeners at both the Central Prison and the Normal School Grounds have been planting large beds this year and intend to do more of it next year if possible. There is an increasing demand for them for private places also.

E.

Florists' Hail Association.

President J. M. Jordan of the Florists' Hail Association has appointed John G. Esler, of Saddle River, N. J., Treasurer pro tem of the F. H. A. Members of the Hail Association will please make all remittances payable to the order of J. M. Jordan and mail same to John G. Esler, Saddle River, N. J.

JOHN G. ESLER,
Secretary.

A Few Gems

YOU OUGHT TO HAVE.

FUCHSIA LITTLE BEAUTY.—A Gem of the first water for florists and market gardeners, will produce triple the amount of flowers than any other sort, and a very early bloomer, single blue corolla; sells at first sight. Price $1.00 per 12; $7.00 per 100.
PETUNIA PINK BEAUTY, the best selling plant for any florist, color most exquisite rose, finely fringed and filled; grow a big house full of it and it will net you a quicker net profit than any other plant—$1.00 per 12; $7.00 per 100.
MARGUERITE CARNATION, finest strain for summer bloom; will give you flowers for 5 months outdoors in greatest abundance; $3.00 per 100. $25 00 per 1000.
CHRYSANTHEMUM THE QUEEN, the white Chrysanthemum for the million as pot plant or cut flowers; largest flowers without too much care; $5.00 per 100; $15.00 per 1000.
OUR NEW ROSE AMERICAN PERFECTION.—This sport will produce twice the flowers than Mermet or Bridesmaid on strong erect stems, and flowers will last a week in perfect coudition, a vivid rose; also the finest bedder among Teas. Try a hundred; you will not repent it. Only $6.00 per 100, $50.00 per 1000, from 2-inch pots. Send a list of your wants. Address

C. F. FAIRFIELD, Florist,
SPRINGFIELD, MASS.
When writing mention the AMERICAN FLORIST.

Pittsburg, Pa.

Cut flower trade is anything but brisk, people don't seem to buy so freely as the weather gets warmer. Cut flowers are plentiful; supply more than the demand. Plants for the garden are going a little slow at present.

Elliott & Ulam had the decoration of the banquet given by the Americus Club in honor of General Grant's birthday, which was quite an elaborate affair. This alone put a little life into the business for a few days.

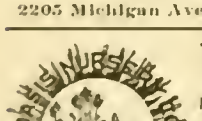
The Florists' Club meeting was rather poorly attended. The committee appointed to see the store men and growers in regard to the chrysanthemum show reported little or no encouragement. The committee was discharged and the show abandoned. A committee was appointed to wait on Mr. E. M. Bigelow to ask permission to hold a cut flower exhibition of chrysanthemums in the Phipps conservatories in conjunction with Mr. A. W. Bennett.

The Phipps conservatories at Schenley Park seem to be the special place for the pleasure seekers on Sundays. There must have been over fifteen thousand passed through last Sunday. The special features now are one large house of calceolarias and another of cinerarias and hydrangeas. Azaleas and Easter lilies have lost their beauty and will be replaced this week by rhododendrons.

Mr. Randolph, of Randolph & McClements, is reported sick.

The warm spell has made flowers and plants over plentiful. This is the case with all kinds of stock and it seems to be selling at what would appear to be anything but remunerative figures. Trade in some of the stores last Saturday was good.

Seed trade in all quarters is reported a good average. A. J. E.



RUBBERS.

NOTE.—Wanted in exchange, Golden Bedder Coleus, Vincas and other Vase and Basket plants.

H. W. TURNER, Chrysanthemum Specialist, SHARON, PA.

It seems the simplest matter to get a good photo of a floral arrangement made, but a few trials show that such is not the case. The flowers have depth, but take and show flat in the pictures; delicate shades and tints are lost entirely; contours show misshapen; defects show exaggerated.

Long's Florists' Photographs

are the result of much effort and study, and practically perfect. Send for catalogue.

The Directory

For 1894

IS NOW READY.

Price $2.00.

AMERICAN FLORIST CO.,

CHICAGO.

Denver, Colo.

Spring trade opens up slow.

The Denver Florist Co. have opened a new store at 781 16th street.

The annual election of the Denver Florists' Society was held at the society's rooms April 7. The following officers were elected: President, Mr. John Berry; vice-president, A. M. Lewis; treasurer, Emil Forter; corresponding secretary, Harrison H. Given; recording secretary, Adam Kohankie.

The advance schedule for the '94 chrysanthemum show of the society is out. The society has voted $800 in money for prizes this year.

Mr. Edouard Emmerick is in correspondence with parties in Japan, with the object of securing some more of the beautiful Japanese varieties similar to the one he handled at last year's show and which attracted so much attention.

In spite of the fact that not a florist in the state will make expenses this year a venturesome young man from the east is figuring upon a lease on the ground adjoining the Colfax Floral Co.'s plant with the object of erecting thereon a range of houses. "He'll know better next time."

Mr. Wm. Clark of Colorado Springs, who has been spending the winter in southern California for his health, has returned much improved.

Mr. Hugh Connor, who has been in charge of the rose department of the Colfax Floral Co., in company with Mr. Ernest Flohr, has leased a greenhouse plant in Canon City, Colo., and will grow cut flowers and plants for the mining towns.

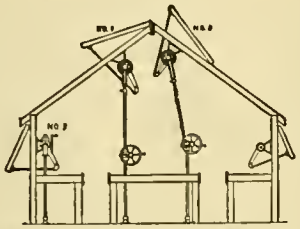
Harrison H. Given reports a largely increased mail order trade, but a very poor local business.

For the first time in many months there is not an idle greenhouse hand in the city.

Denver florists are trying to figure out the reason why none of them were able to strike more than 25% of their rose and carnation propagation this year. Some place the blame on the water (they all use hydrant water) and some on the sand, but all agree that something was wrong and that the general strike was way below the average.

The park commissioners have decided to get along without a superintendent this year, the chairman of the board, Mr. John L. Daily, having assumed the duties of that office in connection with those of the chairmanship. Mr. Dailey is by trade a printer, but for the past fifteen years has been a professional politician, having held the position of county treasurer for twelve years of that time and his knowledge of floriculture and forestry is to say the least "rather" limited. As the park commission have over $65,000 at their disposal for the year of '94 the general sentiment is that they are making a mistake in being so exceedingly economical at this time when we have so many idle men in the city and also that they are making a greater mistake in placing the charge of the work that is to be done in the hands of a man who does not profess to know anything about park work or gardening. The city has nearly 100 acres of dedicated park lands that are absolutely unimproved and it looks almost criminal to allow another year to pass without taking steps to improve them.

H. H. GIVEN.



Please mention the American Florist every time you write any of the advertisers on this page.

The florist's friend in working and prices.

No repairs for 5 years. no chains to break as is the result with others.

Opens Sash uniform on 100 foot houses. A new device.

Send for Catalogue and Estimates.

E. HIPPARD, Youngstown, Ohio.

Fenster Pappe, A Substitute for Glass. Stretch FENSTER PAPPE taut and use batten in nailing on to sash. Then paint the rough surface thoroughly with boiled linseed oil until it shows a gloss. Let it become THOROUGHLY DRY before using, when it is claimed to do service for years. The application of the oil makes FENSTER PAPPE sufficiently translucent for plant life.

IT IS USED as a coveriug for cold pit sash; excellent for use in palm or fern houses; to grow strawberry plants, early vegetables, tobacco, etc., under. A most handy article as a protection against the direct rays of the sun.

TRY a roll of eight yards as a sample, which will cover about four sash, for $1.00. Original rolls, 36 inches wide, 110 yards long, for $9.00. For further particulars address

August Rölker & Sons, Sole Agents, 136 & 138 W. 24th St, New York.

Chicago.

Gentlemen:—Last season we purchased three of your Improved Green House Boilers. They have done heroic service the past winter—eclipsing every claim you made. Since Feb. 25th one large boiler has been doing the work of two, heating six houses 185 ft. + 24 ft., with 9 pipes (4 inch) each; i.e. about 26000 square feet of glass, the hot water being forced through nearly two miles of 4 inch pipe. While the weather has been mild we doubt this showing can be excelled. Needless to add your boilers please. Yours very Respectfully
Brant & Noe.

J. C. VAUGHAN, Agent, CHICAGO.

Pittsfield, Mass.

A special meeting of the Gardeners' and Florists' Club took place on Wednesday which was largely attended. It has been decided to hold another chrysanthemum show the first week in November and the executive committee has materially improved the premium list, new classes have been introduced so as to give all a chance to compete, and the important premiums have been increased. It is hoped that year by year better premiums will be offered, as the interest in the show increases. It is uphill work to educate our busy patrons and friends to the realization and appreciation of our beautiful flowers, but we are doing it successfully. There is little doubt that in a few years this county will excel all other counties in this section, not only for the number of greenhouses, and beautifully laid out gardens, but in increasing interest and love for flowers.

Things are booming up here a little in greenhouse construction, and plans are already in progress for greenhouses for two more private families in Pittsfield, who hitherto did not have one foot of glass. This is one result of the interest created by our two successful chrysanthemum shows. W. M. E.

Laredo, Texas.

We have a temperature here now (May 1) of from 98° to 110° in the shade. Nymphæas, nelumbiums and all water plants are doing finely. Geraniums are dying in the heat. Cacti are of course flourishing. Roses have been in perfection since February 1 but are now succumbing to the heat. Figs are nearly grown and are bearing full. Corn is two feet high. Clematis, plumbago, honeysuckles, morning glories, manettias, jasmines and mock oranges are in full bloom. Also three varieties of double flowered pomegranates in my garden hedgerow are a mass of flowers. They are 12 to 15 feet high and a grand sight. ANNA B. NICKELS.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

UTICA, N. Y.

"Standard" Flower Pots.

As manufactured by us have carried off highest honors wherever shown and have stood the best test. They are used in all the leading floral establishments in the United States. For prices address

The Whilldin Potterv Company,
BRANCH WAREHOUSES: 713, 715, 717 & 719 Wharton St., Philadelphia, Pa.
Randolph Ave. and Union St., Jersey City, N. J.
Jackson Ave. and Pearson St., Long Island City, L. I.

STANDARD FLOWER POTS

Every user of Flower Pots should correspond with us before purchasing elsewhere, our facilities are unequalled.

A. H. HEWS & CO., N. Cambridge, Mass.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

SYRACUSE POTTERY CO. OFFICE: 403 North Salina Street, SYRACUSE, N. Y.

The Influence of Flower Shows and Public Parks.

[*Read before the New York Florist Club by Samuel Henshaw.*]

What a change has taken place within the memory of many of us in everything pertaining to the art of floriculture. It is not many years since it was thought necessary to surround a garden with a ten foot wall, and when parks for the public were first proposed some of the old fashioned and conservative people shook their heads, and voted against such an innovation, declaring that if the public were let loose in a garden or park everything would be quickly destroyed, and a barren waste would be all that would be left to look at. How different we find it to-day! I know of only one park that is locked every night, and that is Gramercy Park in this city; this is done as much to retain it as private property as it is to keep the public out. The small park at the Bowling Green, "where Broadway commences," has still the same iron railing around that it had before the revolution, minus the crown which formerly gave a finishing touch to each post. All the rest are open.

The small parks in various parts of this city are gay just now with pansies, daisies, forget-me-nots and other spring flowering plants, together with a liberal use of tulips, hyacinths and other bulbous plants, to be succeeded later with coleus, geraniums, cannas and many of the choicer kinds of plants that a short time since were not considered safe to be trusted to the tender mercies of the public. Where there is water, or a fountain basin, they are made doubly interesting by a liberal use of various aquatic plants; the Egyptian lotus, nymphæas and many of the floating plants are always surrounded by a crowd of admirers; even the street Arabs, newsboys and bootblacks appear to be fascinated by this interesting class of plants, occasionally envying the plants their element, "particularly on a sultry day," and if they can catch the policeman off his guard, taking a dip in the water. Otherwise the flowers are not interfered with, even in the most crowded parts of the city.

Central Park, with its charming landscape effects, always draws a crowd, and is beautiful either in winter or summer, but especially at this season of the year, when there is a freshness and fragrance not noticed at any other time. It seems a pity that there is not more attention paid in this park to the growing of a collection of flowering plants. The newly acquired parks can be left more in a natural state, being farther removed from the dense population that is fast surrounding Central Park, but this will always be, strictly speaking, the home garden, and can well afford to be made as attractive as it is possible to make it. Space should be set apart to lay out a flower garden on a comprehensive scale, without interfering with the already existing plan. In other parks in smaller cities in this country, particular attention is paid to having a well planted and arranged flower garden, where all the rarest and choicest plants available are planted with a lavish hand for the edification of the public. Mention might be made of the chaste and very pleasing arrangement of the flower gardens at Lincoln Park and Washington Parks at Chicago. I do not mean that it is desirable to have too many imitations of globes, gates ajar, or Sol's clocks, done in flowers, but good plants and the best varieties are used in both parks, and reflect great credit on those in charge.

Washington has an endles round of beautilul parks, well arranged and planted; the same may be said of Boston, with its liberal use of native plants for decorative planting, and skilful blending of nature and art. Philadelphia, Allegheny City, Pittsburgh and many other cities are much more liberal than New York in this respect—even Prospect Park, Brooklyn is ahead of us, both in greenhouses for keeping up a constant succession of blooming plants through the winter, and in a summer display of flowers.

It is none too soon for a society like ours to urge the proper authorities to do something on a liberal scale in this direction. New York certainly can afford to make a grander display than any of the cities I have mentioned, and instead of following, ought to take the lead in all the different branches of both floriculture and horticulture. It comes within the scope of this society to make any suggestions that will result in making the parks of this city superior to anything to be found elsewhere. We may expect at some future day when the proposed Botanical Gardens are located and planted, to have a second Kew Gardens belonging to New York, but if these are started at once it will take years to get them fairly under headway; we want something for immediate effect, and this can be accomplished by devoting more space to the cultivation of flowers in Central Park.

The Floricultural display at the World's Fair, which was promised to surpass anything that had ever been attempted in that time, was a great disappointment to all of us. Strangers visiting the grounds set apart for that purpose would come to the conclusion that New York and Pennsylvania could show little else than cannas and echeverias; to be sure there was a very creditable display of aquatics by William Tricker, one of our members, and one of the very best samples of lawn making, was the green setting of the principal buildings shown by the Peter Henderson Company, from seed sown the same Spring.

One of the most pleasing things I have heard of lately is, that one of the rich men of New York has offered to spend $250,000 in the form of a school, or some

way to teach children a more intimate knowledge of our native plants. The more they get to know of plants, either wild or cultivated, the more interested they will become in everything belonging to floriculture. Those of us that were fortunate enough to see the interest taken by the poor Kindergarten children when invited to visit our flower show, where each child had a plant given it to grow and bring back in autumn to show in competition for prizes, will not soon forget it. Many of these same children will cherish the memory of that time; the time will come when many of these waifs will rise in the world, and the interest in flowers started at that time will cling to them for life, probably some of them becoming the best customers of the future florists.

Arrangement of Cut Flowers.

DIFFERENT EFFECTS TO BE PRODUCED WITH EQUAL QUANTITIES OF THE SAME MATERIAL.

Different effects to be produced by judicious arrangement of the same sort of material is a subject that should be studied with a good deal of attention. It frequently happens in the course of business that we receive an order for a number of pieces, let us say baskets, each to cost the same, but to be entirely different in appearances. It often happens at the same time that your choice of material at command is rather limited. It is here that ingenuity and skill come into play. If we are allowed to select our own shapes the matter is not very difficult since a selection of forms entirely dissimilar in style will make our work comparatively easy; but where your customer selects the forms and chooses from your stock baskets, which though not alike in every detail yet are very much alike in general style, we have not quite as easy sailing.

We find it a rather difficult matter to properly illustrate our subject by the photographic process, since by this means we are unable to show the color contrast, which is so important in this class of work. The style of arrangement also is apt to suffer, for in order to illustrate the position of the flowers, the view necessarily has to be taken at such an angle as to make the object look rather squatty and stiff in the low forms of baskets.

The material selected for the arrangements illustrated consisted of the following: 12 La France and 12 Perle roses, 25 lily of the valley, 25 Romans, 25 carnations, one bunch (25) sweet peas, 1 dozen fronds of adiantum and 25 common ferns, with a spray of A. plumosus for the handle basket. As regards stemming all the flowers used are subject to the same rule as was given in the preceding article.

Let us consider the arrangement of the first form, which is that of a high handle basket. Having followed our hints on mossing such a form, that is to the effect of raising the sphagnum pretty well up, we proceed to properly place the green ferns (although as remarked before smilax may be used to good advantage in their place). Remember, we are now considering only the common styles of baskets. Many forms of highly ornamental goods are made up without the green trimming at the outer rim in the way shown here, which forms we shall treat later on. The style of arrangement of this basket is to keep each kind of flowers grouped together. The La France as shown in the engraving, are placed on the left hand side, starting from the center and running diagonally across on half of one side down to the rim. We next arrange the Roman hyacinths alongside in a spray from the center down to the rim. Next we place the carnations (Portia) which carries us up to and past the handle on the right hand side. On the reverse side, which does not show in our picture, the Perles are placed. Next to carnations a spray of lily of the valley separating these from the La France. A tip of asparagus plumosus is thrown lightly over the left hand side of the handle on which is arranged a spray of Blanche Ferry sweet peas. Now we can take this same basket, rearrange our material and give a different character to the design. The treatment of the handle is quite important to bring out the different effects. As a rule we prefer to use only only one kind of flower for this purpose, especially in arrangements such as we have been considering, or those where but one or at least but a few varieties are used. But where a mixture of different material is employed we may safely depart from this rule, though in that case also it is not advisable to use too many kinds.

Suppose we take our flowers and use them mixed together. In that case we might arrange the spray of La France and valley or combine the same rose with Romans or with sweet peas. For green we can change to smilax. We may also make the spray somewhat longer and carry it over the handle, allowing the tip to droop down on the other side. Again by adhering to our first plan to keep our colors and kinds separate we may divide them into smaller groups of irregular number, say the roses in 5 to 7 and the smaller flowers from 10 to 15 and arrange in clumps of irregular shape with a view to proper color effect. In this way we may make up the same identical form in a half dozen or more different ways with the same material and have each one different in character and general appearance.

Our second illustration gives a view of one side of a basket without handle, made of the same material as No. 1. The form is an oblong, rather square at the corners, the rim of the basket being about 4 inches from the bottom. This form is also arranged in sections with the grouping somewhat different. The La France roses in this arrangement are interspersed with the valley on the left hand side, against which, to the right, the Perles are placed, followed by a grouping of the sweet peas. Diagonally across the reverse side we place the carnations with lightly arranged sprays of Romans on either side. This form also may be treated in different ways but being without handle, which always gives character to a basket, is not susceptible to as many changes as the former.

The last form shown is that of a shape somewhat like a market basket with a rather low handle. There are serious objections to forms with a low handle. If we attempt to make a loose arrangement the flowers will come up nearly if not quite to the top of the handle, often hiding this altogether. Such a form cannot be mossed up very high anyway, and if we attempt to arrange our material at such a height as to clear the handle we have to moss the form so flat that the effect is bound to be squatty in appearance. Still in order to satisfy all tastes as much as possible we are obliged to carry a variety of forms in stock and when the buyer has made up his or her mind on a certain form we are often obliged to subordinate our better judgment to the whims of our patron.

Our last illustration shows such a shape made up as loosely as possible, the moss in the form being but slightly rounded up, nevertheless the line to top of handle is but slightly raised above the level of the flowers.

The flowers used in this form are also the same as in No. 1 and 2, but the varieties are mixed together, the hyacinths forming a fringe around the edge while the lily of the valley is run across the handle. To effect a change the sweet peas, either separate or combined with either valley or Romans, can be employed on the handle, but roses would be out of place as these are too heavy for such a purpose. The flowers in the basket proper, are subject to the same variation as given in Nos. 1 and 2.

In all such arrangements as have been under consideration in this article adiantum should be used liberally. Ornamental at all times it particularly aids us in such combinations where color and kinds are grouped separately to break the sharp lines; it enables us to blend one shade into another as nothing else will.

In showing the combinations for effect in the foregoing we selected the various kinds employed at random. Other varieties might be chosen with equally as good if not better results: Thus, if La France is not at hand Mermet, Cusin, or any other pink variety, would fill the bill just as well. For Perle we can substitute Bride, or if yellow is thought desirable there is Buttercup carnation, or daffs and tulips when those are in season. Or substitute red roses of any variety for the same color in carnations. The main point for us to consider is to avoid similarity in appearance of the different forms of designs made up with a limited selection of material. If we confine ourselves to baskets we can call to our aid so many more quite distinct styles from those treated in this article that to describe and illustrate them all would take up far more space than we can give to this series. We shall touch upon this same subject again at some future time when we reach the higher grades of these forms.

The same material treated in bouquet form would give us a decided change. If used in hand bouquet form we have perhaps more material in the number of flowers given than would be necessary. One-half the quantity is sufficient for this purpose, but if we still adhere to the same sorts above mentioned we can follow on the same line of arrangement as laid down on the baskets. The same holds good also regards vase bouquets. In these we can use the full number given and in these we find a good chance for various combinations, though not quite to the same extent as those of basket forms.

Imperfect Glass Burning Plants.

A correspondent writes that after considerable investigation he has discovered that the burning of the foliage of his plants, over which he had been much puzzled was caused by imperfections in the glass.

We imagined that all in the trade were aware of the fact that imperfections in the glass are apt to act somewhat as lenses when the sun strikes them at the right angle and as a result burn the foliage upon which they happen to be focussed at the time.

When building all glass should be carefully inspected and any lights that have whorls or other imperfections should be rigidly rejected. Our correspondent will do well to go over his houses this summer and replace all imperfect lights with perfect ones.

Our correspondent asks if something

HIGH HANDLE BASKET.
ARRANGEMENT OF CUT FLOWERS.

cannot be done to make dealers send out none but perfect glass. All those that make a specialty of glass for greenhouses are aware of the requirements of the trade in this respect and most of them are, we believe, ready to guarantee their glass, at least of the better grades, and replace any lights that prove to be imperfect.

Express Rates.

Complaints reach us that agents at destination often refuse to allow the special rate of 20% less than merchandise rate, though when express has been prepaid the special rate has been allowed.

As the rate, according to the classification, is permissible but not mandatory, the remedy would be for the shipper to stipulate with the Express Co., that the shipment be billed at the special rate before delivering the goods to them. The rate is allowed only on shipments "prepaid or guaranteed." The demands of a large shipper are always more apt to receive proper consideration than those of one who receives occasional shipments, and particularly if the latter is at what the companies call an "exclusive" point, namely, one reached only by their company. But the good will of the large shipper is always sought, because he ships to points that are not "exclusive" as well as those that are, and this gives him an opportunity to discriminate to an appreciable degree against any company whose general methods do not please him.

As of course low express rates stimulate shipments the shipper is serving his own interests by making sure that consignees get the very lowest rate to be had. To make certain that the matter does not escape the attention of the shipper it might be well for those ordering to add to the order instructions to see that the shipment is billed by the express company at 20% less than merchandise rate.

The One Judge System.

Is not Mr. Ewing just a little reckless in his inference that a large majority of the societies and clubs in this country have arrived at the conclusion that one judge gives more satisfaction to exhibitors than three and that a large proportion of those interested in exhibitions in America have adopted the "Toronto plan"?

I will not ask him to explain by what occult power he has discovered that my original assertion was made at random, but coming "down to plain practical experience" of which he truly says an ounce is worth a ton of unsupported assertions, I will respectfully (not "sarcastically") request him to favor the readers of the AMERICAN FLORIST with a list of the societies and clubs giving important exhibitions regularly who have adopted the one judge plan, with the exception of the Toronto organization.

WM. J. STEWART.

Greenfly.

ED. AM. FLORIST: Can you not obtain for the FLORIST an article from Prof. C. V. Riley on the origination of the green fly or aphis. Harris in "Insects injurious to vegetation" does not explain the matter clearly. I find lice on Ipomæa Learii leaves which had just cast the seed shell. The surroundings were clean. It certainly looked as if the egg was in the seed and hatched after the germination. An Argyreia telliæfolia, after expanding the first two leaves and starting the third leaf, the latter was literally plastered with lice. It was impossible for them to have been transferred from other plants. An article from Prof. Riley would be of the greatest interest and I trust you will be able to secure it. F. C. C.

In answer to the above it may suffice to state briefly that plant lice hibernate in the winter-egg state or in the condition of agamic females upon the roots. Most of the summer generation are composed of females only and these give birth to a succession of living young. An occasional winged generation provides for the spread of the species. The sudden appearance of the insects upon greenhouse plants is generally due to the alighting of a winged female upon the plant and the deposition of living young which begin reproducing in a very short time. C. V. RILEY.

Washington, May 7.

Prof. Riley Resigns.

Prof. C. V. Riley, who has been Government Entomologist for nearly twenty years, has tendered his resignation, to take effect June 1. Prof. Riley retires at the request of his family, who feel that he has earned a right to rest from the arduous duties he has so faithfully performed for many years. In his resignation he urges the appointment of Mr. L. O. Howard, who has been his chief assistant for 16 years, as his successor. He will retain, however, his connection with the National Museum, where he is Honorary Curator of the Department of Insects. Dr. Riley has done splendid work during his connection with the Entomological Division of the U. S. Dept. of Agriculture, and he has an international reputation. He has recognized the growing importance of a study of the insects affecting ornamental plants and has always taken much interest in specimens sent him by us for investigation. We deeply regret that he has found it necessary to retire from the position he has so long and so efficiently filled.

DO YOU WANT a list of the cemeteries of the country that use trees, shrubs and plants largely in the ornamentation of their grounds and that are apt to be large buyers of these and other horticultural supplies? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

DO YOU WANT a list of firms in the trade that issue catalogues, with key showing proportion of space given each branch of the trade in same? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

WHENEVER you want anything pertaining to the trade, and do not find it offered in our advertising columns, write to us and we will take pleasure in assisting you to find what you want.

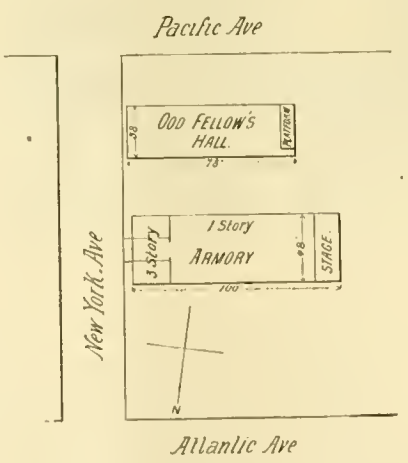
Please mention the AMERICAN FLORIST every time you write to an adverti ser.

TO PREVENT RUST.—Dissolve one pound of sulphate of copper in two quarts of ammonia in a 2-gallon jar. When dissolved add another quart of ammonia and stir well. [The liquid can be kept in this form for some time and used as needed.] Add a pint of this solution to a barrel of water and syringe the plants with a force-pump every two weeks. And don't let the time for spraying pass without attending to the operation.

Carnation Notes.

During May and June we are always sure of having a glut of flowers, excepting on special occasions, and yet such special occasions occur just often enough to make it worth while carrying the plants along until about July first. It is often a question to know what to do with the flowers part of the time during those months. Often they are rushed in on the commission houses regardless of the supply and demand; this is all right for the grower who has been disposing of his stock in that way all season, but for a grower who has been selling to the stores direct all season to put his stuff into a commission house and expect good returns is all wrong. In the first place the house cannot in justice to those who have been regular consignors place these odds and ends shipments in the market until the others are all disposed of, neither can he use them to break down the market on his regular consignors. If he does these things he is no earthly account either to himself or the trade, and if he does not how can the grower expect to get any respectable returns for his stock?

There are three methods of disposing of one's stock; either by retail direct, selling to retailers, or consigning them to a commission house. Either of them conducted separately makes a nice clean method of doing business; any two or the three of them conducted at the same time makes a disagreeable and annoying method of doing business. He who does one thing well and only one thing well is likely to do that thing much better than if he did other things fairly well. My methods of disposing of surplus stock may not be the best in the world, neither are they, I think, the worst. First, if we are very busy we make up a nice lot and send them to one of the hospitals, some days for one ward, other days for another, the object being to have plenty of them wherever they are made use of. If time is not particularly precious I take a lot out and give them to some sick families who can afford no luxuries. This may not be a dollar and cents way of disposing of your stock, in fact sometimes you will want to add a dollar or two with the flowers, but taking from January 1 to January 1 again, I think you will be better off than if you were to put your flowers on a market already glutted to stagnation.



Another point to be carefully watched when flowers become plentiful, is to have them strictly first-class in every way; you are then more likely to get something out of them; if they are worth growing at all they are worth growing well.

When you are ready to pull out the plants, pull them out. Do not leave them to dry up or rot on the beds or benches. Cleanliness during the summer is just as essential to a well regulated place as it is in the winter season. You do not want to make a harbor for all sorts of insects and fungoid growths. If your plants should be affected by the carnation rust do not throw them on a manure or compost heap, but burn them up as completely as it is possible to do, and do not save a vestige to breed the rust for another season. A. M. HERR.

The Convention Exhibition.

The executive committee of the Florists' Club of Philadelphia at its meeting held on Tuesday, the 8th inst., discussed the subject of Halls at Atlantic City for the convention of the S. A. F. next August.

The Morris Guards' Armory and the Odd Fellows' Hall are engaged, these being the only available halls suitable for the meetings and for the trade exhibit, and the question to be decided was—in which to hold the meetings? The Odd Fellows' Hall was said to be too small for the meeting as it only seats 500. But on the other hand it was pointed out that if it was too small for the meetings, it would be even more objectionable for the exhibition. After a full and free discussion it was finally put to a vote and decided that the exhibition should be in the armory and the meetings in Odd Fellows Hall.

The accompanying diagram shows the position of the two halls. They are quite close to each other.

It would seem that the Philadelphia people have decided wisely, for even if the first meeting be a little crowded, that is better than a few hundred people down in the corner of a great big barn with a sense of desolation all around them. A somewhat crowded audience always lends inspiration to the proceedings. There will be plenty of room at the subsequent meetings after the opening session and then the exhibition, even with the larger hall, will not have enough of room. The exhibition feature of the convention becomes more popular every year, and promises to be more so this year than ever before. The attractions of the great seaside resort will undoubtedly take hundreds of florists from all parts of the country who have never before attended a convention, and it is just these men the trade exhibitors want to meet and who will prove the most profitable visitors to the exhibition. The shrewd business men are already making their arrangements for an effective display of their wares at this great occasion. There will certainly be a larger attendance than ever before at any convention and the exhibitors are bound to reap a rich harvest. In this connection it may not be out of place to remind intending exhibitors that size of exhibit alone does not count for everything. A neat, compact, carefully arranged display will give often better results in a small space than a large badly arranged exhibit. It takes time and thought and trouble to plan out a good stand and it cannot be begun on any too soon. All applications for space must be in 30 days before the exhibition opens, so there is only some 8 weeks ahead in which to plan out and get the exhibit under way. A uniform rate of 25 cents per square foot is charged for all space used. Those in charge of the exhibition supply staging, etc., and are prepared to do everything in their power to facilitate effective displays and make the exhibition a grand success. Applications for space should be sent to the superintendent of exhibition, Mr. G. C. Watson, 1025 Arch St., Philadelphia, as soon as possible. Application blanks, rules for exhibitors, and all information promptly furnished on applying to the superintendent. Write him.

Chicago.

It will no doubt be surprising to many when we state upon good authority that the aggregate amount of cut flowers sold in the Chicago market exceeds that of last season by over $40,000, the total gross sales amounting approximately to $525,000. There are at present 10 firms engaged in the regular wholesale business, but one of these being in business only about 1 month, only 9 of them are figured on as doing business the last year. The sales of these 9 firms aggregate the snug little sum of $445,000. The returns from these firms are in most cases verified by the books and can be relied on as being nearly correct. The balance of the trade, amounting to about $80,000, was done by the members of the exchange and quite a number of growers who sell their products to the retail men direct. These figures are based in a number of cases on reliable information but also partly on estimates only. The above figure of $80,000 is therefore only approximately correct, but is rather under than over the mark. These figures do not include a vast amount of stuff that is grown and sold by florists who do a retail business on their premises, or those who operate large establishments for growing their own supply.

The gross amount, exceeding half a million dollars, is quite a respectable showing for this city, and when we consider that an actual gain over last season was made, in spite of hard times and general depression in other lines of business, the result is most gratifying. But whereas the increase in gross sales is less than 8%, the report from wholesale men shows that the increase in the amount of stock sold is no less than 30%; indeed a number of houses estimate the increase at a much higher figure, but even taking this low estimate of 30% it must follow that the average prices realized have been considerably less than last year.

How much of this stock is sold for consumption in this city, and how much of it is grown here, is a question pretty hard to figure out. According to estimates made by wholesale men who do a shipping trade about 25% is sent out of the city, while two firms report 60% as their shipping trade; others have only 20 to 25% and some of them do an almost exclusively local business.

As to the amount of stock shipped in

ILLUSTRATION NO 2.
ARRRANGEMENT OF FLOWERS.

from outside points some houses report this to be largely in excess of outgoing shipments, while others handle exclusively homegrown stock. On figures obtained we cannot venture to give any percentage which would give a correct idea; it is however safe to state that the incoming shipments amount to less than outgoing ones. We subjoin a few remarks on the trade by wholesale men.

Kennicott Bros.: Amount of business larger than last year. Amount of stock handled fully 33% larger than ever before, but prices obtained a good deal less on average. In roses, Beauties were in first-class demand, with average fair price, first quality largely for local demand. Good demand for red roses such as Meteor and Wootton for most of the season. Brides in fair demand. Pink sorts such as Mermets, Duchess, etc., didn't average as good in demand. For La France demand almost entirely local; little shipping done in this rose. Violets scarce most of the season, demand brisk and supply short, prices good. Bulbous stock, no demand except for valley, prices for the former not paying for bulbs. Harrisii sold in large quantities, average prices low. No demand for spring flowers. Incoming shipments largely in excess of outgoing, the latter not as large as formerly. As compared to aggregate amount sold, about 30%.

J. B. Deamud & Co.: This firm being in business a little less than a year no comparison with last season can be made. Last season's trade very satisfactory. Prices obtained considerably less than realized on some grades formerly. Beauties, of which large quantities are handled, were always in good demand, and brought fair prices. Violets in great demand, supply short. Red roses and Brides, in small roses, mostly in demand, supply often short. La France and Albany, if fine, in good local demand, but little sale for inferior stock. Little shipping trade in these roses. Valley fairly good in demand. Romans very low in price and small demand. Harrisii sold well but prices very low. Stock handled entirely homegrown, shipping trade about 30%, mostly in the smaller kinds of roses.

Corbrey & McKellar: Amount of business showing an increase. Beauties in steady demand at good prices. Hybrids, except good Brunners, slow. In smaller roses, red had the call most of the season, Meteors and good Woottons being often short. The glut affected the pink varieties more than other sorts. Carnations in uniformly good demand and call for fancy sorts constantly increasing; prices for this flower satisfactory. Bulbous stock, no sale. Violets, demand brisk, supply short. Orchids, the various sorts of cattleyas sold well, but demand for other forms slow. Shipping trade about 40%.

Reinberg Bros.' aggregate amount of business was in excess of last season. Beauties in the lead. Although large quantities of these roses were offered last season, the supply was constantly short of demand; prices satisfactory. Red roses most in demand, Meteor particularly being often very scarce. La France of A 1 quality in good local demand. Shipping trade constitutes about ⅓ of the business. These orders call mostly for fair grades of the smaller varieties of roses such as Mermets, Brides, Perles, Meteors and Gontiers and good stock of the commoner varieties in carnations, fancy sorts mostly for local trade. No stock from outside points is handled. Large increase in the amount of stock handled.

The Niles Center Company reports a good business. This is a company of growers who handle their own stock principally. A large shipping trade is done, being about 60% of the gross sales. Beauties in good demand, selling at fair prices. Jacques when first brought in the market sold well at good prices but the latter part of the season prices realized were low. The same in hybrids. Violets in great demand, mostly short in supply, prices good. Carnations in good supply and demand. Bulbous stock very unsatisfactory. Good demand for Harrisii but prices very low. Mignonette the early part of the season in good demand realizing fair prices.

A. L. Randall: Amount of business about the same as last year. Stock received is mostly from local points. Shipping trade about 20%. The demand for first-class Beauties is almost entirely local, little if any being shipped out. In small roses Meteor takes the lead, the demand being generally far in excess of supply. Violets always in good demand,

prices realized satisfactory to the growers. Carnations, supply large, quality good, sales satisfactory. Bulbous stock a drug. Considerable increase in amount of stock sold.

E. H. Hunt: Business satisfactory. Considerable stock is received from outside points and large quantities are shipped out, being about 60%. The same points are made here as noted in every instance. Red roses in the class of smaller roses taking the lead, while the pink sorts generally suffer more in a glut than other varieties. This house is receiving some good Kaiserin which sell well. La France is in good local demand, but no calls are made for shipping. Violets here, as elsewhere, met with brisk demand. Bulbous stock, the old story, no demand. Harrisii sold fairly well but at very low figures. Carnations very steady for the season, average prices much better than roses.

Olsen & Hughes and Prince & Co., report a growing business, and in respect to market conditions their experience is about the same as those quoted above.

All the members of the new exchange handle their own stock severally and do entirely a local business, and so do those growers who sell to the store men direct, still there are perhaps a hall dozen, more or less, shipping their product to other markets.

To report the market as extremely dull has become rather monotonous of late. The first part of the week business was probably as dull as it could possibly be, towards the end, however, a change for the better was noted, in fact on Saturday everything was cleaned out and on Sunday morning some of the dealers experienced some difficulty in obtaining stock to fill orders.

The continuous warm weather, with the thermometer mounting into the eighties on several days, has had a very enervating effect on stock in general and roses in particular; the latter begin to look very tired. Mermet is putting on her summer complexion, not at all becoming, though a few growers are still sending in some blooms of fair color. Bride is running considerably smaller. Meteor, on the other hand, seems to glory in the warm weather and is at present one of the best roses on the market. La France are also fair. Gontier is played out for the season. Jacqs are almost entirely cut out; there will be but few flowers of these until the outdoor crop comes in. Beauties are still very good, but these also show the effect of the extreme warm weather, running rather uneven in color.

A good deal of the stock is becoming badly mildewed. In a general way we have noticed a much smaller percentage of mildewed stock this season than in former years. This would prove that our growers have learned how to keep this pest in check to a much larger extent than was the case in past seasons, when clean stock used to be the exception and not the rule.

Prices in the different rose classes remain relatively the same as last week. Carnations are in good supply with generally fair quality. Demand for these is steady at prices of last quotations. Harrisii at present are not over plenty. Longiflorum is coming in freely and which takes the place of the former to some extent. These sell at $5 to $8. The few violets offered at present are worthless.

Spring flowers are in small demand. Lilac is not nearly as abundant this year, owing to the severe frosts in April, which killed many of the flowerbuds. Outdoor valley is still coming in in large quantities and at $1 per 100 is generally sold out pretty clean. Tulips are mostly gone, only a few Parrots, Gesneriana and late doubles are remaining, these move very slowly.

Growers and dealers in bedding plants are hustling at a lively rate. Generally speaking it is not considered safe in this latitude to bed out any thing except the most hardy varieties before the last week in May, but this spring the weather has been so uniformly warm and pleasant, in consequence of which outdoor vegetation has made such a rapid advance, that apparently the season is two weeks ahead of the ordinary time. Under these conditions it is quite impossible to persuade the purchaser that it is early and rather risky to venture on bedding out such tender varieties as coleus, heliotrope, etc. We noticed a number of beds of these plants set out last week and if these should live to see the first day of June without encountering some frosty nights it will probably be the first season of the kind.

A meeting of the Florists' Club was held at the rooms of the new Cut Flower Exchange on Thursday last. The trustees, in whose hands the selection of a suitable place for holding the meetings in the future was entrusted, failed to make a report, so until they do the club will meet at the above quarters. The several offers made by wholesale men to hold these meeting at their places of business was considered, but the expression of opinion by those present were nearly unanimous in favor of establishing headquarters for the club in some suitable down town locality where the club would have a home of its own.

There has been some lively letter writing going on in connection with the removal of President Waller of the Lincoln Park Board. In his letter of removal Gov. Altgeld took occasion to cast some reflections upon Gen. Fitz-Simons, a well known citizen interested in the construction of a portion of the Lake Shore Drive, the work having been done through an arrangement with the Park Board. Gen. Fitz-Simons replied in a red-hot letter through the daily press. The following comments on the same by the Chicago *Herald*, the leading organ of the political party of which the governor claims to be a member, though he is now flatly repudiated by all its best representatives, will be of interest:

We presume that no such open letter as that sent by General Fitz-Simons to Governor Altgeld ever before was addressed or at any time printed by a private citizen in regard to the acts of the chief executive of a great commonwealth. The reason whereof is plain. Never before has the chief executive of a great commonwealth assumed a role at once so dictatorial and so petty. Governor Altgeld combines within his own entity the principles of czarism and anarchism. His anarchism he desplays to the rabble; his czarism he manifests by despotic interference with the commissioners of parks, the trustees of charitable institutions, and other appointed officials, who by law are as independent in the discharge of the functions of their offices as he is in the discharge of the high duties of his exalted position.

To lawlessly meddle, to needlessly nag, to causelessly provoke, has been Altgeld's policy from the day in which he published a vile diatribe against an honored judge who had prevented his acquirement of a large sum of money from the city treasury to the day in which he bullied the West Park commissioners into the selection of the Garfield Park racetrack's tool to the office of secretary, and to the later day in which he strove to bully the North Park commissioners into the discharge of a faithful superintendent that one of his own heelers might take the place. In short, from first to last, the governor's policy has been personal, and necessarily has begotten personal criticism. The commonwealth of Illinois is disgraced by the feuds between its governor and certain of its honored citizens. But it is the governor who has made the feuds inevitable the citizens have no option between submitting in unmanly silence to his aspersions of their character and to his usurpations of their rights and a spirited reply to his insolently verbose abuse of official correspondence.

It is needless to comment at length upon General Fitz-Simons' reply to the governor's abuse of official correspondence. In a letter to Mr. Waller, a park commissioner, Altgeld needlessly, untruthfully and libelously assailed the character of Fitz-Simons and others. The answer is before the people. General Fitz-Simons is one of the gentlemen who can say as Byron said to the Scotch reviewers, "I, too, can write." He has written. Governor Altgeld has boasted of a thick hide, invulnerable, as he says, to newspaper criticism, but if the barbs of Fitz-Simons have not pierced his epidermis then is it brazen indeed.

Mr. Waller took more time to prepare his reply to Altgeld's insulting letter and it appeared in last Sunday's papers. In it he covered minutely his every act while president of the board and gave in full his correspondence with the governor and the substance of the several interviews with him about park matters. Mr. Waller sums up the case as follows in the concluding sentences of his reply and the governor's letters fully prove the truth of his statements as to cause of removal.

I have been removed from office for a single offense—my refusal to allow you to dictate in regard to the discharge of official duties for which I am responsible. You desired to make the management of the park subservient to your personal interests through the removal of the officers of the board, regardless of the interests of the public. I did not consider this consistent with my duty to the public, nor did I feel at liberty to desert my post through a resignation. The result was not unexpected on my part. Malicious and false charges are published in the public press by you in your official capacity, which capacity alone calls for an answer on my part to any charges made by a person of your well known mental and moral characteristics.

In this, as in many other of your official acts, you have prostituted this high office which you hold to the gratification of personal malice.

Your administration is the greatest load which the party which placed you in office, but which you do not represent, has ever been compelled to carry in this state.

I am content to leave this issue between us to that last tribunal, the people, whose interest I have endeavored to protect and serve.

Superintendent Pettigrew is still hard at work getting matters into such shape that the park will suffer as little as possible when he is obliged to go.

The South Park Board has appropriated $75,000 for the building of new conservatories in Washington Park. Plans are being prepared by C. B. Atwood which will be considered at the next meeting of the Board.

New York.

There was a very good attendance at the Florists' Club meeting on Monday evening to greet Mr. Henshaw and listen to his paper on the influence of exhibitions and public parks.

Previous to the reading of the essay reports of several committees were acted upon. Ernst Asmus reported for the committee on smokers that Mr. John H. Taylor would take pleasure in inviting the members to a smoker on the second Monday in June. He said that Mr. Taylor proposed to set a good example by providing an entertainment such as might be duplicated by other members without overburdening them and that the program would be something entirely new and novel and which no one could afford to miss.

Mr. Weathered reported for the committee in charge of the matter of resolutions on the death of Thomas L. Russell, and Mr. Stewart presented similar resolutions for the committee on the death of Myron A. Hunt, both reports being unanimously adopted by a standing vote.

C. L. Allen announced that the executive committee was making progress in the matter of a chrysanthemum show for next fall and further recommended on behalf of that committee that the club withdraw its claim against the Madison Square Garden Company in connection with the spring show of 1893. An explanation of the committee's reasons for coming to

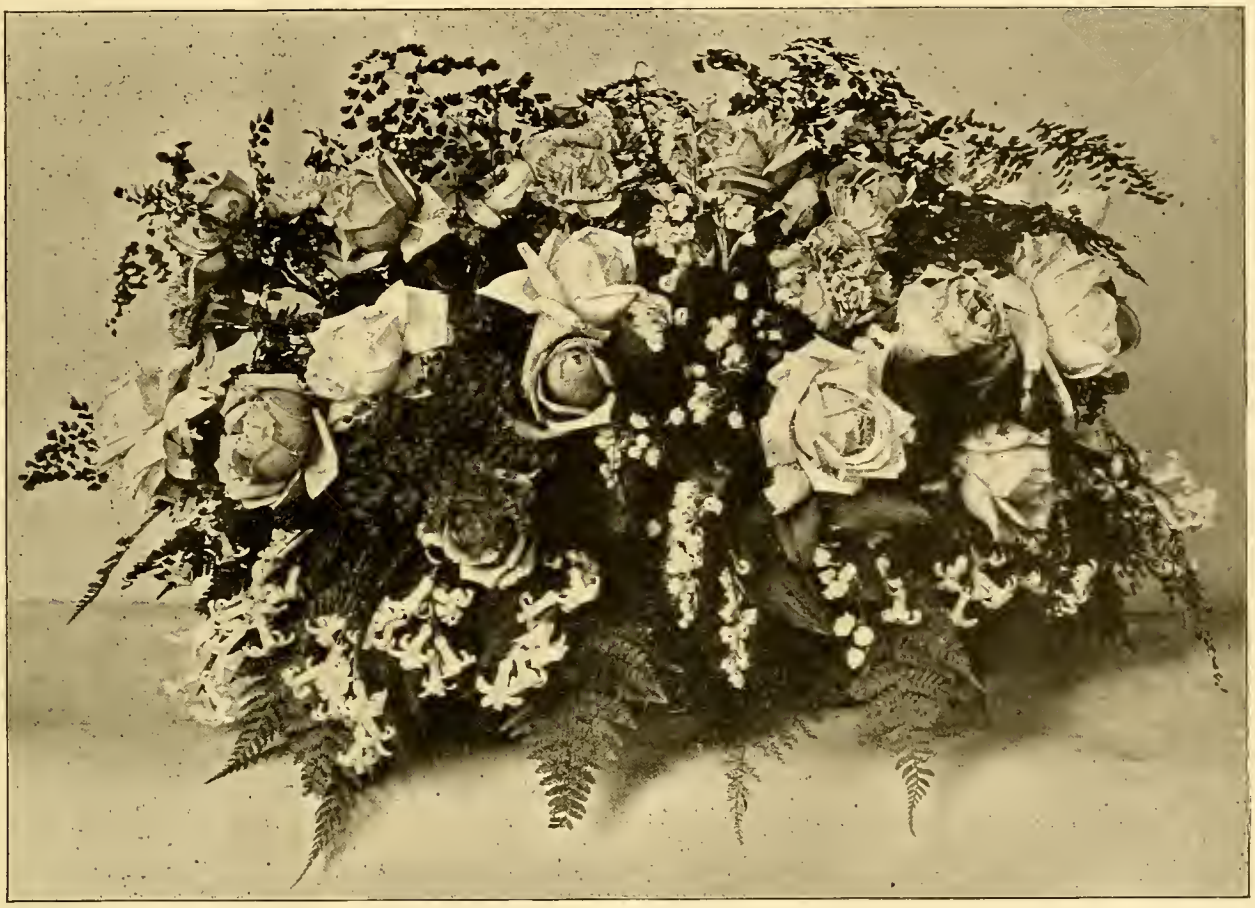


ILLUSTRATION NO. 3.
ARRANGEMENT OF FLOWERS.

this decision was called for and given after which the recommendation was adopted.

Mr. Henshaw was then introduced and read his paper, which appears in another column, and which was listened to with close attention. In closing Mr. Henshaw told of public parks in England with which he was familiar where the people are reminded by sign boards that it is their own domain and reminded of the folly of destroying property belonging to themselves, with the result that no policeman has ever been required to protect the plants or flowers. He made a strong plea in the interest of flower exhibitions and pronounced these as the most effectual means of educating the people to a full appreciation of horticulture and referred most hopefully to the future of the flower trade.

Mr. Wallace made reference to the increasing complaints of people stealing plants and flowers from the New York parks. Mr. O'Mara suggested as a remedy "that we turn the matter over to the preachers." Mr. O'Mara spoke also of the widespread effect of one well kept garden in a neighborhood and advised the giving by plant growers of their surplus stock to village improvement societies and similar organizations as a course that would surely make a grand return in the future. C. L. Allen spoke in a similar vein and urged that the club could make a strong point by trying to induce the park commissioners to pay more attention to decorative plant work.

A vote of thanks to the American Florist Co. for a copy of the Florists' Directory was passed with the request to the secretary that he bring the book to every meeting for the edification of the members.

Cut flower trade is exceedingly dull in both wholesale and retail lines with no indications of immediate improvement. Roses are becoming less plenty and in quality they average very poor. A party named Josephs, hailing from Brooklyn, is said to be playing quite a confidence game among the growers of Jersey City and elsewhere, obtaining goods which he sells at less than cost price but for which he never pays. Watch out for him.

Philadelphia.

Business is falling off rapidly and each week seems duller than the last. There are plenty of flowers, although many growers have stopped sending in, being too busy with spring bedding plants to pay attention to their cut flowers. Prices for all kinds of stock are about the same as last week. The warm weather is commencing to tell on the quality, but some very good roses are still to be had. Beauties and Belles are now the favorites, the hybrids being all done. Sweet peas are very abundant. The first cornflower of the season was sent in by W. P. Carre, of Mantua, N. J.; it was very fine.

Harry Weiss, of Wayne Junction, has purchased three acres of land at Hatboro and is moving his establishment to that place.

In commenting on Mr. Scott's very excellent paper published last week his ideas were heartily endorsed by several of the leading growers about here. The opinion seemed to be unanimous that in large cities where there was keen competition store-keepers had to have the best stock and as a rule they had to buy it from some of the growers who made a specialty of the kind they wanted, even if they had a country establishment of their own, as flowers from their greenhouses nearly always suffered by comparison with those of the simon pure grower. People who want good flowers and are willing to pay for them may be put off for a time with fair ordinary stock, but as soon as they see something better they want it, and the old dealer loses his customer. It was contended that the grower should never think of going into the retail business, nor should the store man essay to be a grower, for while they were two branches of the same business they could not be profitably conducted under the same management.

W. K. Harris is a great lover of animals of all kinds; not only does he like the domestic beauties of the stable and the farm, but the proud denizens of the forest and the jungle also come in for a share of his admiration. The circus was in town last week, and it goes without saying that Mr. H. was there. On these occasions his greatest pleasure is to feed peanuts to the elephants, and the way they extend their trunks is a sight worth seeing; it does not take the herd long to find out their benefactor is there, and as bag after bag disappears, for he never breaks a package, the small boy looks on in wonder and as his stock diminishes

the circus man, all smiles, hurries his attendant out for another sack. K.

Boston.

Dull times. Everybody says so and it must be true. All are looking forward with hope to Decoration Day, for which they are waiting with as much patience as possible. The hope however, is mingled with much uncertainty, for the unusually early season has put much of the outdoor bloom which is ordinarily relied on for Decoration Day, out of the question. Lilacs, outdoor valley, tulips, poet's narcissus, spiræas and magnolias will have disappeared long before the day comes round.

Rhododendrons will be in full blast, a very rare occurrence for this section. The early ones are already showing color and hardy azaleas are in bloom. Some lucky growers will have quantities of Astilbe japonica in for Decoration Day and they are assured of good returns this time.

The exhibition at Horticultural Hall on May 12, was confined mainly to hardy flowering plants native and foreign, wild and cultivated, a line in which the number of contributors seems to be rapidly increasing. Many plants native in other sections of the country have been introduced here by these enthusiasts and these add much to the interest and value of the exhibitions. The only plants shown on this occasion were two well grown specimens of Dendrobium thyrsiflorum from W. P. Winsor, who also exhibited cut blooms of another and very beautiful form of this showy orchid.

Auctioneer McCarthy tells us that the plant buyers have struck in a week or ten days earlier than they did last year. A larger number of growers than ever before are making consignments of plants for auction sales, and prices while somewhat lower on some things are yet good enough to indicate that buyers do not propose to let their gardens suffer on account of "trade depression."

Visitors in town: Hugh Dickson, of Belfast, Ireland; J. R. Fotheringham, of Irvington, N. Y., and Frank Hamilton, of Tarrytown, N. Y.

St. Paul, Minn.

Summer is here at last and all the florists are busy. Quite a good deal of planting out has been done already and a great deal more remains to be done. There being comparatively few hardy shrubs and roses here, the demand for bedding stock, as well as window and porch boxes and lawn vases, is large.

Stock about town is abundant and looking exceedingly well. An early Easter made room for bedding stock and favorable weather since has brought it on in good shape. Prices are fairly firm and we hear of no plants being sold at such ridiculously low figures as in Minneapolis, where it is reported, geraniums in 4 and 5-inch pots are planted out at $5 per 100, coleus at $1, and other plants in proportion. Any florist who will sell at such prices "cuts his own throat," so to speak, and does the trade more damage than a hundred department stores.

In cut flowers the trade has been good and prices remain firm. The engineers convention which met here during the week has created more or less demand for flowers. Added to this is the usual number of May weddings, also considerable funeral work, so that the week as a whole has been a busy one.

We recently had the pleasure of visiting the establishment of Mr. Fred Busch in Minneapolis and found much to interest, please and instruct. He is the largest grower of vegetables for the market in the Northwest and has 60,000 feet of glass devoted to this industry, besides 60 acres of land under the highest cultivation. But it is the greenhouses in which we are chiefly interested. Two of them are each 200 feet in length by 35 in width running east and west, consisting of one span to the south with a gentle slope. In these houses we found tomatoes of the Lorillard variety 12 feet in height loaded with luscious fruit, cucumbers of the White Spine variety, just coming into fruit and laden with a heavy crop. Part of one house is devoted to wax beans which are just full of heavy clusters of long yellow pods.

Another range of 9 houses extending north and south is also filled with cucumbers. In these lettuce and radishes are grown during the winter months. Other houses contained parsley, cress, rhubarb, mint and other table delicacies. Mr. Busch's output is enormous, but he finds a ready market for his products in the Twin Cities, Duluth and Chicago, in fact has many orders which he cannot fill.

The houses are well and substantially built and kept scrupulously clean and tidy. Cypress sash bars, red cedar posts and double A glass are used exclusively.

A simple, light and durable ventilator lift of his own invention strikes us at once with its practicability and cheapness and is suggestive of the alert and active brain of its inventor. The whole plant is supplied with steam heat generated by three immense boilers and supplied throughout with water from artesian wells.

In addition to these he has large washing and packing rooms, where every convenience and contrivance to facilitate the handling of his enormous crop is to be found. The business is entirely under Mr. Busch's personal supervision and every detail is scrutinized by him.

Some of our florist friends could profit by Mr. Busch's methods and all would certainly envy his houses. The large ones especially would be fine for growing roses.

Mr. Busch however is well satisfied with the vegetables and would not care to exchange with the florist and his Christmas and Easter harvests, for his harvest is perennial and as fast as one crop is exhausted another takes its place, so that the houses both summer and winter are producers and the products at all times find a ready market.

Besides being a hustling, active business man Mr. Busch is genial, entertaining and hospitable, socially. His library is well supplied with books on floriculture, horticulture and vegetable culture, and he is keeping abreast of the times in all.

Cincinnati.

At the monthly meeting of the Cincinnati Florists' Society after the routine business had been transacted, the society was favored with a paper by Wm. Murphy, a member of the society, on his recent trip to California. The paper gave minute descriptions of all points of interest, and a bath in "The Great Salt Lake," Utah. The essayist was heartily applauded and a vote of thanks tendered.

Mr. Richard Witterstaetter followed with a few well chosen remarks in which he reminded the members that Decoration Day was nearly at hand, and moved that a committee be appointed, whose duty it should be to see to it that the grave of Mrs. Hulroyd, "who had in the goodness of her heart presented the florists with this floral market" be appropriately decorated with the best flowers produced in this market. Said committee was appointed.

A vote of thanks was also tendered the AMERICAN FLORIST for a copy of their trade directory.

Trade has been very quiet. During the past week Mr. H. A. Kresken had one very handsome floral piece representing an urn, made principally of roses, lily of the valley, callas and adiantums. The height of the emblem was 4 feet, surmounted by a dove, and was given by the Duckworth Club, the occasion being the funeral of Geo. Duckworth. Numerous other designs were also seen at this funeral.

As the May musical festival opens on the 22nd the retail florists expect to do lots of business. E. G. GILLETT.

To move the Surplus.

In view of the heavy surplus of flowers with which the market is now burdened would it not be well for the retailers generally to give the public a chance to enjoy flowers at moderate rates, letting it be thoroughly understood that the concession is a special one and that the low prices will prevail only during the time that the market is overloaded?

Would not the insertion of the accompanying advertisement by the leading re-

FLOWERS.

Just at present we have an unusually heavy crop of flowers and can afford to sell them at

Half usual prices.

For the present choice flowers are within the reach of the most modest purse.

This week

Is the time to buy flowers. For after the present heavy crop is gone we shall have to put prices back to their usual level.

SMITH, The Florist,

. . . 124 Brown Street.

tailers in their local papers bring out enough additional buyers to make the returns from sales larger than at present and without doing permanent injury to rates? Will it not be wise for the retailer to follow a little closer the fluctuations in the wholesale market, particularly where these fluctuations are very marked? If this is done, to get the full benefit, it should be supplemented by advertising in the local press, for unless the people are thoroughly informed of the special concession it will be of no value to the dealer.

If any of our readers try the suggested adv. or something similar we should be glad to hear what the results were. Certain it is that the retailer can afford to offer at 50 cents a dozen roses that he can buy at $2 a hundred and if he can sell 100 dozen at 50 cents a dozen and only 20 dozen at $1 a dozen the lower rate is the most profitable to him and the results will be equally satisfactory to the grower through a disposition of a larger share of his product.

The adv. in the local daily might with advantage be supplemented by a circular to all who are known to be occasional flower buyers.

An effective means of calling out buyers at times of surplus that we know to have been used was the presentation of small

sample boxes of flowers to a selected list of flower lovers. In each box was a card on which was printed "With the compliments of —— ——, Florist." In most cases (this was in a city of moderate size) the recipients called the next day in person to thank the florist for the present and that was when he got his returns. He explained that his stock was very large just then and he could afford to be generous. "Just now," he would add "I can afford to give two dozen roses for the price I have to charge for one at other seasons, and knowing your fondness for pink roses I felt I ought, while it was in my power, to give you the full measure that was necessarily short when flowers were scarce and high." The result was almost invariably a sale of flowers to the value of a dollar or so, the ladies being unable to resist the temptation to secure a bargain.

Nearly every woman loves to have flowers in the house at all times and they will always gratify their taste if they can do it at "cut rates." But let it be well understood that the low rates are for a brief period only.

St. Louis.

Trade for the past week has been brisker than usual, planting out has been going on very extensively, and many popular varieties have been exhausted at different establishments. Cut flower trade remains about the same; there were several heavy funeral orders from out of town points that materially helped the market.

There was a rather slim attendance at the regular club meeting, owing to the amount of work going on. The minutes of the special meeting called to take action upon the death of Mr. Hunt, were read, and all the actions approved. It has been decided by the trustees of the Shaw Estate to offer the medal for the coming season for a new plant of decided merit, limiting the competition to no one class, and relying upon the judges to make the proper selection.

Some very good chrysanthemum blooms were shown by Mr. Halstead, of Belleville. Complaints are being heard from several parties in regard to their chrysanthemum plants throwing flower buds instead of growing as they should.

Mr. Witten of the Missouri Botanical Gardens, has been requested to favor the club with a paper on the relative hardiness of plants under northern and southern exposure, and will doubtless do so at the next meeting. K. F. T.

News Notes.

COLLEGE HILL, O.—George Magrie is succeeded by the firm of Magrie & George.

SAN FRANCISCO.—The affairs of the firm of Carbone & Monti are in the sheriff's hands.

RAHWAY, N. J.—Wilbur Leonard has started in business here. Address is P. O. box 529.

BROOKLYN, N. Y.—H. Ericksen, formerly of Blue Island, Ill., has started in business here at 84 Maspeth avenue.

HANNIBAL, MO.—Garner Bros., of Kansas City, are establishing a branch business here. They are building three greenhouses 18x80.

HELENA, MONT.—Mrs. L. J. Wells has taken personal charge of the Wells' Conservatories, the former manager, Mr. Carter, having resigned.

ORANGE, N. J.—T. H. Spaulding has been dangerously sick with pneumonia. He is still confined to his bed but has been pronounced now out of danger.

JOHN SPEELMAN, of C. J. Speelman & Sons, Sassenheim, Holland, has completed his American trip and sails for home by steamer Maasdam on the 19th inst.

LOUISVILLE, KY.—The greenhouses and stock of the late A. Lauer have been purchased by Mr. Fred. C. Haupt, proprietor of the Louisville Floral Bazaar. He will continue the business at the old location.

LOUISVILLE, KY.—R. T. Lewis has started in commercially, at corner 9th and Madison streets. He built a house 20x130 last fall and is now adding another 30x130. The latter will be devoted to roses exclusively.

VINCENNES, IND.—Mrs. W. A. Reiman has purchased the greenhouses and stock of Mr. J. A. Balmer. She will now have nearly 11,000 feet of glass. It will be devoted mainly to roses and carnations. Mr. Balmer goes to Pullman, Wash., as horticulturist of the Washington State Agricultural College.

YOKOHAMA, JAPAN.—Our gardens are now (April 19) at their best, which is rather early in the season. Most shrubs have finished flowering, namely single and double flowering cherries, coryolopsis, Jasminum Sieboldi, camellias, Forsythia suspensa, Daphne odora, magnolias in variety, spiræas in variety, etc. Maples are lovely now. L. Boehmer & Co. will have 5,000 Pæonia arborea in full bloom in about a week.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

Kidd under the firm name and style of Newell & Kidd and located respectively at Kansas City, Missouri, and Saint Joseph, Missouri, is by mutual consent this day dissolved. Mr. Arthur Newell will continue in the business as a florist in his individual capacity at Kansas City, Missouri, and Mr. Joseph N. Kidd will be located in the same line at Saint Joseph, Missouri.

Kansas City, Missouri, April 30, 1894.

PHILADELPHIA Palms

AT AUCTION MAY 21.

AUGUST RÖLKER & SONS,

New York.

When writing to any of the advertisers on this page please mention the AMERICAN FLORIST.

Buffalo.

Our club has dwindled down to about twenty live florists, and only about half of them can be got together at one time. So it was thought that it was not necessary to rent a hall or meeting place for this handful. Therefore it was resolved that hereafter until further notice we should meet in the houses of the different members, and, judging from the experience of the first meeting of this sort, it is going to be a success. Business was well attended to, and at its conclusion Mr. John F. Cowell gave us a half hour's talk on colors. It was most instructive as well as entertaining and was finely illustrated. At a rather late hour the meeting adjourned and we were all preparing to depart, but "Andy" (we were at the house of our president, W. A. Adams) would not have it so, and we had to walk into another room and take just enough of his hospitality so that there would be no fear of our suffering during the night with long fasting. It was neatly done and not overdone, and the first man who attempts to spread himself any further in this direction will immediately get his walking papers from the club. Half an hour was most pleasantly spent listening to a short program of music, both vocal and instrumental, much of which was intensely enjoyed, for it was of the gilt edged sort, particularly the humorous part. The next meeting of the club will be held in June at the house of Mr. Cowell on West Ferry street.

Mr. Dan'l B. Long has issued a very neat invitation to the trade of the city, and I presume western New York, to attend his third annual opening on the 15th. Dan knows how to run these things, and I know I will have something good to report next week.

Business has been quite fair the past week and everything is at least two weeks earlier than ordinary. Our great stand-bys, lilac and lily of the valley, which are greatly depended on to help out at Decoration Day in cheap flowers, will be entirely gone at the end of the month. Violets are about gone; other flowers in good supply.

We have had a goodly number of drummers with us this week, but they were mostly of a kind that you could talk to; among them Mr. James S. Taplin, representing Mr. Joosten and Mr. Vaughan, who talks for J. C. Vaughan and talks so neatly and pleasantly that you are almost sorry when he is gone. W. S.

New Catalogue (No. 4) containing over 1,000 Ornamental Cuts for Florist's use, such as envelopes, letter heads, bill-heads, cards, advers., floral designs, etc., at from 30c. and upwards. Price of Catalogue 25 cts. (deducted from $1 order).

When writing mention the AMERICAN FLORIST.

THE AMERICAN FLORIST

Subscription $1.00 a Year. To Europe, $2.00.

Advertisements, 10 Cents a Line, Agate; Inch, $1.40; Column, $14.00. Cash with Order.

No Special Position Guaranteed.

Discounts, 6 times, 5 per cent; 13 times, 10 per cent; 26 times, 20 per cent; 52 times, 30 per cent. No reduction made for large space.

The Advertising Department of the AMERICAN FLORIST is for Florists, Seedsmen, and dealers in wares pertaining to those lines ONLY. Please to remembe it.

Orders for less than one-half inch space not accepted.

Advertisements must reach us by Monday to secure insertion in the issue for the following Thursday.

Address THE AMERICAN FLORIST CO., Chicago.

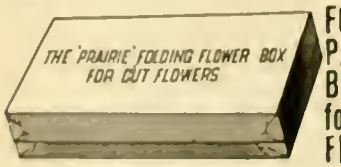
ST. LOUIS SUBSCRIBER.—You can do no better than to secure a copy of our trade directory and reference book and study pages 155 to 199, on which appear Mr. Scott's seasonable hints for the year. We can not answer your last inquiry. Possibly an adv. in our want column would put you in communication with some one having such material to sell. Give your name and address with future inquiries so we may be able to answer by mail if that should seem desirable.

Wages.

What are usual wages given to ladies for making up and decorating? Also for flower store work? ONE IN THE TRADE.

The above question is very indefinite. The wages given to ladies as well as those paid to men vary with the ability of the party and character of the work required, etc. There are but few instances where ladies are given full charge of the decorating and making up work in large establishments; in these cases probably a salary of from $1,000 to $1,200 per year is rarely exceeded. Ladies are employed more generally as assistants, cashiers, etc., many of them not receiving more than $6 or $8 per week.

DO YOU WANT Mr. Scott's seasonable hints for the year in book form, so that you can refer readily to his suggestions for any week in the year? You will find them in this form in our trade directory and reference book for 1894. Price $2.00.



YOU CAN never invest $2 to better advantage than in a copy of our trade directory and reference book.

NOTICE.

Chicago Flower Exchange.

At a special meeting of the Stockholders of the Chicago Cut Flower Exchange, held at No. 45 Lake Street, Saturday morning, April 28th, it was resolved to discontinue the business. All persons having claims against the Chicago Cut Flower Exchange are requested to present same at once, and those indebted to said Exchange are requested to make payment without delay to

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

REPORTS from the California seed districts indicate continued drought, which will reduce some of the estimates of large crops made earlier in the season. The lima bean district in Ventura county is reported to have suffered severely.

MR. F. HOWCROFT, of Howcroft & Watkins, of London, has just made a ten days trip through the United States, returning on the Majestic from New York, May 16th.

MR. CHAS. P. BRASLAN is now in California.

MR. E. V. HALLOCK will hereafter represent Messrs. Vilmorin, Andrieux & Co., of Paris, with office at 26 Barclay street, New York.

MR. W. A. BURPEE was suddenly recalled from California on account of the severe illness of his mother.

Missouri State Horticultural Society.

The semi-annual meeting of this society will be held at Harrisonville, Mo., June 5, 6 and 7. An exhibition will be held in connection with the meeting. Programs may be had on application to the secretary, Mr. L. A. Goodman, Westport, Mo. It is announced in the program that Missouri now has no less than 46 working county horticultural societies.

DO YOU WANT a complete alphabetical list of carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

DO YOU WANT the census statistics regarding the florist, nursery and seed trades? You will find them in our trade directory and reference book for 1894. Price $2.00.

Toronto.

J. H. Dunlop opened his new store one door from the corner of King and Yonge streets this week. The situation makes it a pretty expensive stand but everything has been done with a view to catch the best trade and some of the others will have to get a wiggle on to keep in the procession. The store window was beautifully decorated with cattleyas and large quantities of roses on its opening day.

There is no improvement in the state of the cut flower trade to record nor is there likely to be, though of course in plant, shrub and tree lines things are rushing.

A large piece of wild ravine has just been added to Reservoir Park and Mr. Geo. Reeves, the superintendent, has a large gang of men on getting it into shape to receive the many picnic and pleasure parties that frequent this park during the summer months. It is a lovely spot truly and Mr. Reeves is just the man who knows how to operate on it and still retain its natural loveliness.

Some of the local seedsmen are already making preparations to receive the Seed Trade Association in June. It is probable the City Council will give them some assistance towards their entertainment.

E.

Validity of a Floral Design Patent.

The United States Circuit Court holds, in the case of Krick vs. Jansen, recently decided, that patent No. 408,416, dated August 6, 1889, to William C. Krick, for a floral letter or design is valid. It says that if the patent was for the letter merely, consisting of the foundation, covered with flowers, as described, it would be anticipated and void. But it is for such letters in combination with the holes and picks for holding them in position on large floral pieces. This combination seems to be new, and quite useful. It did not involve great invention; but greatness is not required for patentability. It seems to be sufficient for that. Furthermore, it is infringed by letters which do not have holes through the foundation for attaching the picks to them, but have the picks at the edges of, and over, the foundation, attaching them to it in a manner equivalent to that, as taking the substance of the patented invention.

PANSIES,

THE JENNINGS STRAIN.

Plants in bud and bloom $1.50 and $2.00 per 100, $15.00 per 1000; medium sized plants of mixed, white or yellow, $5.00 per 1000. Extra 60c hundred by mail.

New crop Pansy Seed ready June 25th, better than ever. Cash with order.

WILLIAMS & SONS CO., Batavia, Ill.
Manufacturers of BATAVIA LABELS.

DWARF CALLA.
Something that every florist who sells potted plants should have, as this variety of Calla never grows large, and therefore, for window or house culture has no equal. And again, in cut flower work its size makes it a flower that a cut flower dealer cannot well do without. I have several thousand of these Callas in 3, 4, 5 and 6-inch pots which I offer for sale. Correspondence as to price etc. solicited.
LEWIS ULLRICH, Wholesale Grower of Cut Flowers and Smilax, TIFFIN, OHIO.

THE GREAT ANTIPEST.

For particulars, see next week.

R. W. CARMAN, GEN'L AGT.,
291 Amity Street, FLUSHING, Queens Co., N. Y.

Pittsburg.

The regular meeting of the Florists' and Gardeners' Club occurred May 8, but there were not enough members for a quorum, so those present adjourned.

The warm weather has had its effect on trade. Bedding plants are in abundance; reports are that business is not lively. A walk through the markets convinced me that the wholesalers did not fare well, but the retailers fared better. Things are going well on an average, considering the dull times. Cut flower trade is dull and very unsatisfactory; prices are very low and stock abundant.

F. Burki has had a fine lot of sweet peas, and in quantity. Blanche Ferry seems to take best and sell at a reasonable price.

Elliott & Ulam and Patterson Bros. seemed to be quite busy on Saturday last.

Allegheny and Schenley Parks and the conservatories draw large crowds of visitors. The leaves of the Victoria regia at Phipps Conservatories at Schenley lack a few inches of six feet and are showing flower. A house of Rhododendron Catawbiense varieties attracts a great deal of attention.

Messrs. Jacob F. Foster, superintendent of South Park system, Chicago; Frederick Kanst, superintendent of Floricultural Department; and Mr. Atwood, of Chicago, visited Schenley Park on Saturday, inspecting the Phipps Conservatories (with a view to building in Washington Park, Chicago) and went away more than pleased, vowing they would never say a word against Pittsburg again. Panther Hollow, at Schenley Park, carried them completely away; they were also delighted with Highland Park. A. J. E.

Pittsfield, Mass.

The regular meeting of the Berkshire County Gardeners' and Florists' Club was held Wednesday, May 9, Mr. T. T. Connors presiding. There was a fair attendance present and considerable routine business was gone through.

The recent death of a member proved to be a lively subject for discussion. The sentiment of the members was in favor of attending the funeral of brother members and favored the club providing a mourning badge and a conveyance to enable them to attend in a body.

A committee was appointed to revise the constitution and by-laws, believing that important changes were imperative and necessary.

Preparations are being made for the printing of an elaborate annual report and premium list combined and it was decided to allow a number of advertisements, which, we trust, will be of mutual advantage to ourselves and our friends who will take advantage of this. Horticulture is constantly growing in interest in this section.

Mr. N. L. Cobban brought to the meeting a pair of cockchafers to find, if possible, something to either kill them or prevent them from cutting up his strawberry leaves and eating by the wholesale. We would be pleased to hear of a remedy for this.

Mr. A. P. Meredith interested the meeting as usual by a very practical talk on the cypripedium. Unfortunately we cannot publish it, as we were without a stenographer, the address being extempore.

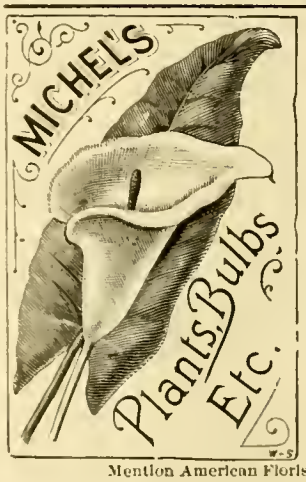
W. M. EDWARDS.

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

A Few Gems

YOU OUGHT TO HAVE.

FUCHSIA LITTLE BEAUTY.—A Gem of the first water for florists and market gardeners; will produce triple the amount of flowers than any other sort, and a very early bloomer, single blue corolla; sells at first sight. Price $1.00 per 12; $7.00 per 100.



PETUNIA PINK BEAUTY, the best selling plant for any florist, color most exquisite rose, finely fringed and filled; grow a big house full of it and it will net you a quicker net profit than any other plant—$1.00 per 12; $7.00 per 100.

MARGUERITE CARNATION, finest strain for summer bloom; will give you flowers for 5 months outdoors in greatest abundance; $3.00 per 100. $25.00 per 1000.

CHRYSANTHEMUM THE QUEEN, the white Chrysanthemum for the million as pot plant or cut flowers; largest flowers without too much care; $5.00 per 100; $45.00 per 1000.

OUR NEW ROSE AMERICAN PERFECTION.—This sport will produce twice the flowers than Mermet or Bridesmaid on strong erect stems, and flowers will last a week in perfect condition, a vivid rose; also the finest bedder among Teas. Try a hundred; you will not repent it. Only $6.00 per 100, $50.00 per 1000, from 2-inch pots. Send a list of your wants. Address

Montreal.

The Gardeners' and Florists' Club met in good numbers on Tuesday last and accomplished a deal of work. We are fast becoming strict parliamentarians, and Cushing's rules of procedure are now being studied vigorously by many of our members.

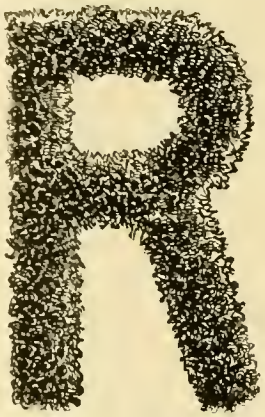
The prizes won by the various players in the social games were awarded, and the social committee was discharged. Special thanks were tendered to the whole committee and especially to its chairman, Mr. A. Wilshire, for their indefatigable attention. The club decided to establish games for summer amusement, and also decided on again having a picnic.

The report of committee on the Horticultural Society's relation with the club was accepted. The club pledges itself to do all it can to assist the Horticultural Society in furthering any and every undertaking that shall advance the interests of horticulture generally, but does not become affiliated with the first named society, as it is generally felt that the work of the club would be crippled by a closer connection. A copy of the new trade directory presented by the American Florist Company was received and the secretary was instructed to convey to the company the hearty thanks of the club for the same. We are now engaged in considering the advisability of obtaining a charter and shall probably get full information at our next meeting.

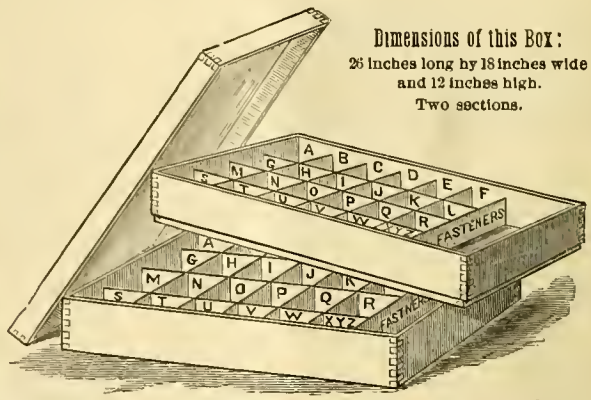
A notice of motion to change the night of meeting was presented. This would be a good change, as several of the members live outside the city, and a change in the night of meeting would enable these members to attend, as a late train would then be available.

A call for volunteers for an essay upon greenhouse construction and heating was readily responded to by deciding to have read, and if possible discussed, the recent essays upon the subject published by the horticultural press. Everyone was of opinion that more practical information could be obtained from them than from our own crude ideas. Mr. Walter Wilshire promised to prepare an essay upon the carnation, and as this gentleman's essays are always good we look for a first-class handling of the subject.

H. STOCKING.



American Association of Nurserymen.



The 19th annual convention of the above association will be held at the Cataract House, Niagara Falls, N. Y., June 6 and 7. A rate of fare and a third for the round trip on the certificate plan has been secured. The Cataract House has made a rate of $3.50 a day, and the Hotel Porter a rate of $2 a day. The program has been issued and copies may be had on application to the secretary, Mr. Geo. C. Seager, Rochester, N. Y.

BUILDING.—Readers who contemplate building additional greenhouses, or remodelling old ones, this summer, will confer a favor by reporting their intentions to us. We are anxious to have as full a record as possible.

DO YOU WANT detailed information about the organization and workings of the various national trade organizations? You will find what you want in our trade directory and reference book for 1894. Price $2.00.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

POPULAR STANDARD VENTILATING MACHINE

The florist's friend in working and prices.

No repairs for 5 years, no chains to break as is the result with others.

Opens Sash uniform on 100 foot houses. A new device.

Send for Catalogue and Estimates.

E. HIPPARD, Youngstown, Ohio.

Fenster Pappe, A Substitute for Glass. Stretch FENSTER PAPPE taut and use batten in nailing on to sash. Then paint the rough surface thoroughly with boiled linseed oil until it shows a gloss. Let it become THOROUGHLY DRY before using, when it is claimed to do service for years. The application of the oil makes FENSTER PAPPE sufficiently translucent for plant life.

IT IS USED as a covering for cold pit sash; excellent for use in palm or fern houses; to grow strawberry plants, early vegetables, tobacco, etc., under. A most handy article as a protection against the direct rays of the sun.

TRY a roll of eight yards as a sample, which will cover about four sash, for $1.00. Original rolls, 36 inches wide, 110 yards long, for $9.00. For further particulars address

August Rölker & Sons, Sole Agents, 136 & 138 W. 24th St, New York.

This is the Boiler

Chicag

Messrs. Kroeschell Bros.
41 to 55

Chicago.

Gentlemen:

Last season we purchased three of your Improved Green House Boilers. They have done heroic service the past winter — eclipsing every claim you made. Since Feb. 25th one large boiler has been doing the work of two, heating six houses 185 ft. + 24 ft., with 9 pipes (4 inch) each; i.e. about 26000 square feet of glass, the hot water being forced through nearly two miles of 4 inch pipe. While the weather has been mild we doubt this showing can be excelled. Needless to add your boilers please

Yours Very Respectfully
Brant & Moe.

FLORISTS WIRE DESIGNS

MANUFACTURED BY

N. STEFFENS

335 EAST 21ST ST. NEW YORK.

Indianapolis.

The Indianapolis Florists' Club held its regular session May 2. It was determined at the April meeting to make the May session one of a social character. The arrangements were placed in the hands of a committee, and notices were sent each member. A large attendance followed. The routine business was laid aside, and the evening was spent in speechmaking, music and "incidentally" refreshments. The event was made enjoyable by the various members taking an active part. The was a fine display of cut flowers contributed by the members. The secretary adopted a novel method of notifying the members to attend the meeting by serving notices on postal cards, each embellished with a pen or pencil sketch portraying in comic characters, the hobby of the member addressed, with an absurd program of the proposed entertainment. It brought them out in goodly numbers.

There was much criticism of the new rules adopted by the Crown Hill Cemetery corporation, who have determined to prohibit the planting of flowers or flower beds by lot owners in the cemetery. Green grass, with trees and shrubbery for the background, may please their æsthetic taste, but it seems to violate the wishes of the community at large, and is a hardship to the florist business.

Business is reported unusually quiet, market trade being considerable less than last year at this time. Cut flowers are getting poor in quality, especially roses; carnations are rather plentiful.

Notwithstanding the bad year for the trade, several new firms are starting in business. Young & Sonnenschmidt are putting up 2,500 square feet of glass east of the city for raising cut flowers. Mail matter can be addressed to 246 East Washington street.

John Grande is putting up 2,000 square feet of glass for a general florist business corner of Shelby and Beecher Sts.

Bertermann Bros. have started a branch floral stand in the large drug store, N. E. corner Washington and Pennsylvania Sts., late quarters of Indianapolis National Bank.

Some good business is expected the coming week, on account of the great music festival and other occasions which are bunched in one week.

J. D. Carmody paid a few days visit to the Capital City; to-day he is attending a banquet of the Loyal Legion at Anderson, Ind.

Our late friend M. A. Hunt will be greatly missed in the councils of our state meetings and exhibitions.

John Hartje is finishing up a large boiler house, ready at any time to connect his houses with steam.

Martin Braendlein has built one greenhouse near the gates of Crown Hill Cemetery, retaining his old place for a while.

The One Judge System.

I obtained my information on this subject mostly from the AMERICAN FLORIST and other horticultural papers. Mr. Stewart has the same opportunities as I have, but if he does not "read, mark, learn and inwardly digest," he has only himself to blame if he is tripped up when making random assertions, and it requires no "occult power" to do the tripping. This is a busy time of year with me but when things are a little slacker during the summer I shall be happy to search out "chapter and verse" for the benefit of Mr. Stewart and ask the AMERICAN FLORIST to publish a list of societies using the above system, although it is getting rather off the track of the original question and doubtful if the "readers of the AMERICAN FLORIST" much care for old news.

A. H. EWING.

Toronto, May 19, 1894.

Chicago Parks.

LINCOLN PARK.

Seldom if ever have our parks looked as well in the middle of May as they do the present season. Trees, shrubs and in fact all vegetation presents an appearance more like June than May.

Lincoln Park is fast putting on its summer garb. Bedding commenced last Monday and is being pushed forward as fast as a large force of men can handle the stuff. Mr. Stromback, headgardener, thinks there is no longer any danger from night frosts in view of the extraordinary forward season, although the bedding out of alternanthera, achyranthus, cannas, etc., has never before been attempted at such an early date. The beds of geraniums, verbenas, stocks and all of the more hardy varieties are nearly finished. The carpet bedding is now in progress. Coleus, heliotrope and the most tender bedders will of course be left to the last. It is expected that everything in this line will be practically finished in about a week, weather permitting.

The borders of hardy and half hardy perennials are beginning to look quite gay, attracting a good deal of attention from lovers of this class of plants. All the varieties without exception have wintered admirably and very little replanting was found necessary. Aquilegias in great variety are in full bloom. The fine assortment of irises promises a fine show. The first blooms are just opening. Among other varieties in bloom now we note Primula auricula, Gazania splendens, Lychnis plumarius rubra, Heuchera sanguinea, myosotis, cerastium, Papaver bracteata, etc. Scattered through these borders with happy effect we find a number of our native wild flowers. Of these we find the anemone and phlox in full bloom, adding greatly with their modest charm to the general effect.

In pæonies, the early red is the only sort now in bloom; the later varieties are looking fine. The Cannell collection from the World's Fair has been added to this group, and will prove interesting, as well as that of phloxes later on, which was obtained from the same source.

Some additions have also been made in hardy roses both standard and bush, all looking remarkably well. In speaking of standards Mr. Stromback states that very little trouble is experienced in wintering them successfully. The plants are laid down in the fall and covered with dry oak leaves, over which boards are placed in such a position as to shed the rain, it being essential to keep them as dry as possible.

The conservatories, attractive at all times, are at present ablaze with gorgeous color. In the north wing the central group of rhododendrons from the Moser collection makes a superb show. These specimens are large and apparently stood the severe test of our summer climate without injury. Some of the finest varieties now in bloom are R. album elegans, Chas. Bagley, Leviathan, Stella and Sir Thomas Sabright.

Arranged in a semi-circle on the side benches is a splendid assortment of calceolarias, still in fine condition although a trifle past their best. Fuchsias in great variety, pelargoniums, some late varieties of azaleas, genista, cannas and many other sorts add their wealth of color to the general effect.

In orchids we notice several pieces of Odontoglossum citrosmum with fine spikes of flowers. Also Oncidium altissimum in bloom.

The fine collection of fancy caladiums, now being rapidly brought forward in the stove house, will soon be added to the display in the show houses.

The ponds of aquatics are looking well. Already the surface of the water is well covered with foliage. Victorias planted out April 20 show leaves 2 feet in diameter. In nymphæas N. zanzibarensis and scutifolia are beginning to bloom and a number of others are showing bud.

HUMBOLDT PARK.

This park, though not as large and pretentious as Lincoln or Washington parks, has still a peculiar charm to the visitor that cannot be found at either of the others. There is a rural aspect to its architecture that is very pleasing, but some of the rural features are carried rather to excess. We admire a green lawn and would like to see a lawn mower used occasionally to keep the grass in bounds. We may not object to a few dandelions dotting the lawns in the spring of the year, but we draw the line at allowing them to go to seed. It seems a pity to spoil the charms of this beautiful little park by letting this plant, which really becomes a pest, overrun the lawns to such an extent that the grass is almost entirely choked out. It is perhaps next to impossible to entirely keep this weed out of the lawn, but it certainly can be kept in check. At any rate it should never be allowed to go to seed. And it is not the park alone which suffers. The winds carry the light and fluffy seeds in all directions, contaminating the neighborhood for miles around. What use is it for the lot owners in the vicinity to keep grubbing out this weed when the park management keeps up acres of nurseries? But where lies the fault? It appears that the superintendent and gardeners are not to blame for this state of affairs. It is claimed on good grounds that the force of employes is entirely inadequate to run things properly owing to a lack of funds.

But what becomes of the large sums of taxes yearly collected for the support and improvement of the west side parks? "Improvements," so called, have swallowed up by far the largest part of these

moneys with very little to show for it, leaving but a meagre sum for running expenses.

This park indulges in the luxury of a rose house, which some of our larger parks can't afford. This house, which is about 100 feet long with a side wing of 50 feet, has cost the tax payers $16,000. The roses are grown planted in benches for cutblooms. But for whose benefit? The general public? Possibly, but we rather doubt it. This reminds us of a little incident which occurred the other day while visiting one of the west side parks. While conversing with a gentleman in charge a young man came rushing out of the office, and without taking the least notice of our humble self, wanted to know of our friend the reason why a certain number of bouquets hadn't been sent at a specified time to the residence of commissioner ———, mentioning by name a well known member of the board, an appointee of our governor. Well, this young man informed our friend, the headgardener, that Mr. Commissioner was raising particular sheol about his bouquets and he had better hustle them over on double quick time. What could our friend do but obey orders or else lose his official head? So two of the men were taken from their work and sent to pick flowers while another employe made up the bouquets, and still another man was finally despatched to deliver the goods. Perhaps this accounts for the presence of the rose houses at our parks.

Very little bedding out has been done yet at Humboldt Park, but there is a fine lot of well grown bedding stuff ready to go out. Mr. Kleppin, headgardener, intends to keep on the safe side and will not venture bedding out anything except geraniums until next week.

The conservatory contains some fine specimens of palms, clean and well grown, notably some half a dozen Corypha australis which are the best we have seen around Chicago. Also several very fine Latania borbonica and Pandanus utilis.

Since writing the above we have experienced one of those phenomenal changes in the weather to which Chicago is no stranger. Ordinarily such changes would excite little comment, being of frequent occurrence, but the extraordinary severity of the weather for the last 4 days following a season of unprecedented warm, and at times almost tropical, heat, was, even to our natives, a surprise.

A drop of temperature from nearly 90° on Wednesday down to the freezing point in a few hours with a furious northeast gale, blowing steadily for 3 days, has had a very damaging effect on all outdoor vegetation. The foliage of trees and shrubs in the most exposed positions were blown to shreds, and even in the most sheltered spots, more or less damage is noticed.

Of course bedding out has come to a sudden halt. Fortunately, in our parks at least, the most tender plants still remain in the hotbeds or greenhouse. Achyranthus and centaurea, a few of which had been planted, suffered severely and will probably have to be replaced. Alternantheras and echeverias on the other hand show but little the effect of the cold winds. Geraniums are in a dishevelled and bedraggled condition, but otherwise uninjured.

This season has therefore proved again that it is unsafe to attempt bedding out in this latitude until the last days in May, no matter how far the season may seem to be advanced.

The Arrangement of Flowers.

V

FLAT BOUQUETS SUITABLE FOR FUNERAL.

Loosely and tastefully made up bouquets are now among the most popular arrangements for funeral purposes, there having been a decided falling off in the call for set designs. Offerings of flowers in these forms are never objectionable and they can be used equally well to adorn the casket or to decorate the room, and finally the grave.

These bunches may be made so simple and inexpensive as to be within the reach of the poorest, or so rich and costly as to suit the purse of the millionaire. Probably fully one-half, if not more, of all the flowers used for this purpose at the present time are used either as loose flowers or in bouquet form. It happens therefore very frequently that we have a number of these bunches to make to be sent to one address and at the same time most people will leave their order with instructions to avoid if possible a duplication of arrangements ordered by others.

In general form, all being flat (we are now considering this style only), these arrangements are necessarily much alike, but by proper selection of material and changes in detail, we are enabled to obtain different results. At certain seasons of the year the stock at our command is so varied that little difficulty is experienced in arranging a dozen or more quite distinct styles, but at other times our choice of material is very limited, and one is often at his wit's ends to avoid a duplication. Fortunately at present we are not confined to white flowers only, as in former years, in funeral arrangements. Not alone are pink and cream tints admissible but frequently we are requested to employ Beauties and even Jacqs.

Let us now consider a few of these bouquets in detail. Our first illustration shows a bunch of outdoor grown lily of the valley. This flower is much used for this purpose and it makes one of the daintiest arrangements. It can be used either individually, as in this case, or in combination with other flowers, more particularly with roses or violets. These flowers are at command nowadays at any season of the year and even in midwinter or midsummer are generally quite reasonable in price. Quite a handsome bunch may be furnished at from $5 to $10 according to the season of the year. The bouquet we show contains about 100 sprays. In its arrangement the natural foliage of the flower only is employed, with the exception of half a dozen fronds of adiantum for a finish. This finish of green is used in lieu of ribbon. If ribbons be used we prefer them rather narrow. The arrangement of these however in their various forms will form the subject of a future article. If the bouquet to be made is small, say 3 or 4 dozen flowers, and the stems of these are fairly long, we can get along without the use of wire, but for the larger bunches, especially if arranged in long spray form, the wire is indispensable. Besides if the bouquet is to be made quite long we need a support for the back. To use a stick (match sticks are often used) is not desirable, as these are apt to break if bent, which is often found necessary in bending the form into a desired shape. Cane answers the purpose much better. Cut a piece of desired length and wind around it some green material. Smilax will answer, the purpose being to hide the cane from view on the reverse side of the bunch. For wiring flowers use No. 22 or 24 wire, take 3 or 4 sprays of the blooms with a leaf or two and twist the wire around the extreme lower parts of the stems. The arrangement is simple enough. Take up the supporting piece of cane, which forms the back bone so to speak, and hold it in your left hand and wind in your flowers in the desired shape. For tying, as has been stated before, white spool cotton has been generally used, but in recent years, since silkaline has come into use for smilax, this material also is growing in favor for use in bouquet work. It is in every way superior to cotton, being much stronger and in weight not much heavier, besides the string will not show, the color being nearly that of the foliage; but there is a material difference in the cost and for that reason the former is more generally used. Be careful not to let any of the wire show. This should not apply alone to the front view of the bouquet but also to the reverse side as well, which should be backed up with green. If valley leaves are not sufficient use ferns. Where no ribbon is used the stem of the bouquet should be finished by reversing some of the flowers in irregular form, as shown in the engraving.

Illustration No. 2 shows a bunch of roses, about four dozen in number, one-half Brides, the other half Mermets. The two varieties are arranged on a diagonal line, each kind separate. As both of these sorts however are of the same shape, and as pink shows white, as is well known, in a photograph, the division lines of the two varieties do not show in the picture.

The arrangement of this form is materially the same as of No. 1. The stems of the roses generally are of such length that an artificial back support is unnecessary. If, however, the stems are insufficient in length, use the support as directed. In an arrangement of this kind very few of the roses will need wiring. Never use the wire if it can be avoided, the more natural the flowers droop the better the effect. The stem of this bunch is shown unfinished. In most cases ribbons are used, with either a few buds or a bunch of valley or violets tied in with the ribbon. If finished without the ribbon reverse a number of roses and tie in somewhat in the manner shown in No. 1. In all rose arrangements of this kind adiantum may be used liberally with good effect. A number of other varieties, either separately or in combination, can be used equally well. Mme. Watteville is one of the very finest sorts for this purpose. This variety and Bride or Niphetos, Roman hyacinths or valley, make a fine combination. Cusin, La France and Bridesmaid are all good.

Our last illustration is of a combination of L. Harrisii and white tulips (Pottebakker white) arranged on a background of three cycas leaves. Arrangements of this kind, where the larger forms of flowers are employed, are generally tied with ribbon, which should be broad, say number 16, or if the bunch be quite large even wider than that. The arrangement of this form can be seen at a glance, and needs no explanation. It is needless to add that no wires are necessary. For green in addition to the cycas leaves we should use the larger forms of ferns. If A. princeps or any other sort of that type can be had we will find those the very best, but if only wood ferns are at hand these will answer. A few fronds of the lighter form of adiantum can be arranged to droop over the ribbon with very good effect.

Lilies, particularly Harrisii and longiflorum, are in great demand for occasions of this kind. Generally speaking these flowers show to the best advantage when arranged separately, and a combination with other varieties of flowers requires

ILLUSTRATION No. 1.

ARRANGEMENT OF FLOWERS.

judgment. A combination of Harrisii and Dutch hyacinths, especially lavender or dark blue, is in good taste, and tulips, either white or pink, give a good effect. But the lily is too heavy a flower to combine with Romans or valley. Roses too seem to lose in effect when combined with lilies. Lilies may be tied with royal purple ribbon with fine effect, but be careful to select the right shade.

Society of American Florists.

The Trunk Line Passenger Association, which represents all the railroads entering New York and Philadelphia, has, in response to the customary application for reduced fares in favor of members of the Society of American Florists attending the convention at Atlantic City next August, decided that it will be impracticable to apply the usual reduction on the certificate plan, the meeting coming at the busiest part of the season and at a time when summer excursion rates are in operation to Atlantic City and other large resorts. It therefore becomes necessary for those members intending to go to the convention to make early arrangements with the lines over which they shall travel, endeavoring to travel in as large companies as possible, as in this way the most favorable rates will be secured. Delegates from districts represented by a few only should communicate with those having charge of the transportation from the most convenient large city or railroad centre, and thus get the benefit of such low rates as may be secured from such points.

It should be borne in mind also that Atlantic City is a very busy place in August, the normal population of less than 20,000 being at that time increased to possibly 100,000 or more. For this reason it is very desirable that accomodations at hotels or cottages be secured in advance, or otherwise much discomfort may be encountered.

In connection with the above it may be well to add that the Chicago Florist Club has already secured a very satisfactory rate from one of the best lines and florists in the west and northwest are at liberty to take advantage of same by travelling with the Chicago party.

The Market.

The cut flower market seems to be pretty well demoralized all over the country. Can nothing be done through unity of action toward placing the market on a better basis? We invite suggestions from our readers and will be glad to have a general expression of opinion.

In this connection will it not repay every grower in dollars and cents to do everything in his power toward making the fall exhibitions successful. Leaving out of consideration the fact that the shows disseminate an interest in and love for flowers, and thus create future business, is not the immediate effect on the market most beneficial? The flowers used in making the exhibition are taken out of the market (most of them bringing extra good returns to the growers) and it is relieved to just that extent. If the exhibitions in the large cities were discontinued wouldn't the glut at chrysanthemum time be much worse than at present? If that is true then is it not of direct profit to the grower to encourage the exhibitions that more and better premiums may be offered in future and thus afford further relief to the market? But this requires something more than moral support. You should not only be an exhibitor but you should be active in helping to advertise the show and make it a financial success. Make it your business to influence your grocer, your druggist, and other storekeepers with whom you trade to hang one of the chrysanthemum posters or other advertising matter in his window or other place where it will do good. And exert yourself also to see that one is given a conspicuous place in your suburban railroad station. All working together in this way a great deal of valuable advertising can be had at slight cost. And to make an exhibition successful we must advertise! advertise!! advertise!!!

Exhibition advertising must be cumulative to produce the best results. To the enthusiastic lover of flowers one announcement may be enough (if he or she sees it) but the others can be won only by continued invitation. Out of 1000 people who see a first announcement probably no more than 50 may be induced to attend. But an effect will have been made upon the others and that effect may be so strengthened by a second announcement that 50 more will be won, and another 50 by a third one. We are thoroughly convinced that by thorough judicious advertising fully 5% of the population of any city can be brought to pay admission to a really worthy exhibition. If a small city, the attendance can be raised to 10% of the population, as it will be easier to make every one acquainted with the event and anxious to attend.

If no arrangements have been made for an exhibition in your city this year take steps now toward having one held. There is money in it for *you* as well as every other member of the trade in your city.

Call a meeting of the florists of your city together now and make your plans without delay. We shall make it our business to help you in every way in our power. Ask any questions you wish and we will get replies for you from the best posted men in the trade.

TO PREVENT RUST.—Dissolve one pound of sulphate of copper in two quarts of ammonia in a 2-gallon jar. When dissolved add another quart of ammonia and stir well. [The liquid can be kept in this form for some time and used as needed.] Add a pint of this solution to a barrel of water and syringe the plants with a force-pump every two weeks. And don't let the time for spraying pass without attending to the operation.

Carnation Notes.

On every side growers tell us that they will grow more carnations next season. Many are planning to put up additional carnation houses and quite a number are starting new into the business. This is all right to a certain extent but there is danger of overdoing the carnation business as well as any other. Just as soon as there are too many carnations on the market for the demand, so soon will their popularity be lowered and with it the prices will go all to pieces. It is characteristic of human nature to think when any thing becomes very cheap or is seen in quantity everywhere that it is common, and then they will cease to use it no matter what its merits are.

A good carnation should never be sold at less than twenty-five cents per dozen; it does not matter so much if the second class stock is sold out cheap but it does matter very seriously if the better varieties of carnations are sold below that figure. In some of the smaller towns (Lancaster for example) it is nothing unusual to see good carnations sold for ten cents per dozen; the consequence is that the better class of people who could and would pay a fair price look on them as a common article and take something else in their place.

Should present indications regarding the number of growers for next season be realized the result will be an overstock that will work an injury in every way. It will be well to seriously consider this matter before investing much money in carnation growing. In the first place are you sure of a good remunerative outlet for them? if you are and grow good stock there is no better business you can engage in, but if you are not, the many ups and downs you will have to encounter will make it the poorest business you could engage in.

There is not so much danger of an over supply of really first-class carnations, and it will be well for the grower starting into the business, the grower increasing his plant and all of us to produce only the finest of stock. To grow such stock requires plenty of capital and not a little ability and unless one has a fair share of both it is best to go very slow for the first season and see what he can do before plunging into it too deeply. The days of "any place is good enough for the carnations" and "they don't take much attention" are over. To be successful now they must have the best of places to grow in and the constant care of a good man. Neither is there any use of growing the older varieties any longer. If one wants to be on a fair basis in the market with other growers he must buy the best of the new sorts and not look to a few dollars one way or the other in stocking up his place. The long and the short of it is that the days of starting at the foot of the ladder are about over; you have got to start near the top or might as well not start at all. It is all well enough to start in a small way for experience but not to make any money out of the business and that is the object most of us are striving for. "First be sure you are right, then go ahead."

There are still some growers sending in orders for carnation cuttings, with the idea, I suppose, that half a loaf is better than no bread, for cuttings planted from the sand now are little more than half a loaf for next winter's blooming. A good cutting planted from the sand about May 1st and given a little extra care and attention will make a very good plant for next winter's blooming, but take that same style of a cutting June first and it is just a month too late. If you must depend on cuttings obtained now the best plan is to plant them on soil made very rich with well rotted manure and if possible where they can be flooded with water if it turns very dry. But a far better plan is to let them go entirely and depend on good, well-grown field plants that are offered in quantity in the fall by advertisers in this journal. Do not understand me as trying to advertise myself for I do not grow field plants for sale, but I honestly think that it is better to get the field grown plants than to depend on the cuttings planted now.

It is a good plan to take a walk through your carnation patch at least once a week. It will not hurt the patch and you may see something that needs attention that will more than repay you for the bit of time it takes. Very often there is some new insect or fungoid enemy that will develop in the patch and by being on the watch constantly you will see it in time to check it. There is nothing like being on time in all such cases. Prompt action may mean the saving of quite a few dollars.

I have before me an inquiry regarding an insect that eats out the base of the calyx in carnation flowers thereby causing the petals to drop. It is described as about one-half an inch long with a green body and hops like a grasshopper but does not have the legs of a grasshopper. Do any of the growers know anything about it and a remedy for ridding the plants of it?

That is quite a good idea of the FLORIST to keep the formula for the prevention of rust constantly before us, and we will be wise to heed the advice given. It is only by every grower determining to fight the rust with all his might and main that we can expect to accomplish much toward eradicating it. If you do not have the rust and your neighbor has and allows it to go unchecked, you are more than likely to get it from him, so it will be well to remind him that there is a cheap and effective remedy that will at least keep it within bounds.

I have a batch of a novelty that came to me laden with rust. We dipped them in the solution mentioned above and whenever we see a speck of rust developing we pinch it off and dip again. In addition to this we are growing them in the greenhouse in five-inch pots, intending to use them as a test to see if plants that are badly affected from the parent plant can be entirely cleaned of it without serious injury to the plant itself.

ALBERT M. HERR.

Miscellaneous Seasonable Hints.

The last week of May and first of June is the time, in this locality, for filling vases and veranda boxes. If the boxes are not over 6 feet long they can be filled at the greenhouse and carted to their destination. It is more satisfactory to fill boxes and vases at the greenhouse, because you have a much larger choice of plants, and can devote a squad of men to this particular job for whole days or weeks. Wherever they are filled the same remark will apply, as it does to hanging baskets; let the soil be of the richest, for long before summer is over the soil will be heavily taxed by such a quantity of plants crowded into a small space.

Avoid using any plants that have a natural tendency to red spider. Ageratum is one of the worst for this pest. It starts on such plants and quickly envelops the whole lot.

For upright plants you must be guided a good deal by the aspect. If entirely on the north side, or only getting a little of the morning sun you can use Begonia Rex and fuchsias to advantage, and other plants that thrive in the shade, but if exposed to plenty of sunlight the following will be found a good assortment: Palms from 18 inches to 2 feet high, of inexpensive kinds; Kentia Belmoreana and Forsteriana, Chamærops Fortunei, Phœnix reclinata and dactylifera, Corypha australis, and if not too sunny Latania borbonica and Areca lutescens. In ferns Nephrolepis tuberosum and exaltata; the former is much the best and almost indispensable. Dracæna indivisa and australis, and geraniums of compact growth and tough constitution. There are few better than F. L. Raspail, bright scarlet; P. Daubeck, light scarlet, very robust; Ernest Lauth, purplish crimson; La Favorite, white, all semi-double. Acalypha in variety, coleus and achyranthes in variety, begonias, the ornamental leaf varieties, such as metallica, Olbia and others. Begonia Veruon is a fine thing and easily raised. Caladium esculentum when desired, if they are very large boxes, but in limited quantities, as they smother everything else. Anthericum is a good plant for the purpose, and thrives under any conditions. *Don't* put in feverfew, anthemis, fuchsias, or show pelargoniums; however attractive they are at the start they quickly go out of flower and look shabby.

For droopers we use vincas, variegated and green; senecio; glechoma; variegated money vine; lobelia, dark and light blue; nasturtiums; ivy geraniums. The newer varieties of these are magnificent. Ipomæa Mortonii, single petunias; abutilon Vexillarium, double sweet alyssum, and a few others.

The surface of the soil should always be covered with green moss; it prevents the soil being washed, looks neat when first filled, but above all prevents too rapid evaporation. If you are asked to make a veranda box for a customer a good useful size is 7 inches deep, 9 inches broad at top, 8 inches at bottom, inside measure, and any desired length.

You should plant out a good lot of your first sown asters now for your own use. It is time yet to sow for a late crop; you can sow these outside. The end of this month is a good time to sow primulas that are wanted in bloom by Christmas. Place the pots in the coolest house or a cold frame well shaded.

ILLUSTRATION NO 2.
ARRANGEMENT OF FLOWERS.

Don't neglect in this busy time your young cyclamen. They should now be in 3-inch pots, and keep them growing and free of red spider and their great enemy greenfly.

Don't overshade tuberous rooted begonias and gloxinias; the full rays of the sun will hardly do, but a light shade is sufficient. Gloxinias need lots of shade when their beautiful flowers are out, but not before.

Allow me to digress a moment, just to say that it is impressed on me more and more every day that the successful cultivator of the future is not he who can pot fast or well, or even build fine houses especially adapted to the plant he grows, or even any other mechanical operation in the business, or the regulation of heat and moisture to the exact requirements of his plant, but success will attend the man who will faithfully, intelligently and vigorously fight the many vegetable and animal pests that are now trying to exterminate our cultivated plants. You can learn a smart boy to shift a plant or to handle the hose, syringe, or watering pot, in a few months. You can easily get a man to keep your temperature at the right notch. But how seldom you meet him, and what a jewel he is, who will come and tell you that spider is making its appearance on this plant, more smoke is needed in that house; slugs are getting too thick among the ferns; mealy bug must be attended to among the palms; Bordeaux mixture must be applied in another house and anthracnose is in the cutting bench. He is a gardener and should receive credit for it. A man, whether he is an amateur or the boss himself who will pass a plant complacently and see it in distress either from want of water or the attacks of enemies without a pang of distress himself will never make a gardener, and is only of use to you for the amount of mechanical work he can do.

As soon as the benches can be cleared of your spring stock, and 4 or 5 inches of good heavy loam put on them, plant out chrysanthemums; the middle of June is a good time to plant those that you want to have from two to four flowers each, so a plant that has been stopped once is about right. The plants you want for pot plants to be lifted early in September can be from the same stock, although a young thrifty plant in a 2-inch will do just as well, and keep it pinched several times during the season. Chrysanthemums must have no shade at any time of their growth; I am convinced that shade is conducive to that rust which attacks them in August or September.

There is plenty of time yet to propagate more stock and don't forget to keep the sand saturated; twice a day water them, if weather is bright, and never let them wilt during their existence. For the single stem plant in 4, 5 or 6-inch pots, which are becoming more fashionable every year, the middle or end of June is plenty of time to propagate.

If you have any young plants of Linum trigynum in 2 or 3-inch pots plant them out in open ground; they are not yet common, and will be a good Christmas plant. Lift about end of September, and keep well syringed and pinched to produce a compact plant. WM. SCOTT.

Hot Water Under Pressure.

ED. AM. FLORIST:—As the advocate and introducer of the hot water under pressure system for heating greenhouses, allow me to object to some of the remarks made of late by some of your correspondents as to the efficiency and economy of the principle, showing conclusively that they are not well acquainted with it. To begin with the use of common steam and common hot water boilers is to be deprecated as they are not adapted to it, lacking both the power required, and in the case of the last ones, generally made of cast iron, are not safe to use under much pressure, as we well know by experience. Coils made of small steam pipes (from one to two inches) are the only ones to be used to advantage, as the small quantity of water contained, circulating over the fire so many times will be heated to a very high degree, forming superheated water, as they call it, while in steam and hot water boilers, the water circulating only once over the fire, coming in at one end and out at the other, cannot be expected to be very warm. Of course the coils can only be used under pressure as they will generate steam and drive the water out the apparatus in a few minutes.

Our favorite form of coil is the elliptic one, made double or treble by having several coils inside the other, leaving in the centre an opening of 9 or 10 inches to act as a coal magazine, being fed from the top, and the coil about a foot from the grate. A coil made on that plan, two feet high and two feet in diameter, and a shaking grate to correspond, will easily heat from two to three thousand feet of 2-inch piping and carry coal enough to last from eight to twelve hours without replenishing, with an occasional shake at the grate. For a larger amount of work we use horizontal coils which can easily be increased to any size required.

In our houses we use the pressure of a large tank, some 40 feet above the boiler or coil, with the connecting valve (¾-inch) closed about three-quarters, and the supply on the return, so as not to impede circulation, and that has given us the best results, showing a net saving of one-third in the first outlay of construction, one-third in fuel, and another third in heating capacity over other systems.

We had occasion, some 40 years ago to use Parkinson system of high pressure (75 to 100 pounds) and 1-inch piping

throughout, and we must admit that it was the most effective mode of heating we ever saw; the drawback was, however, that under such pressure, contraction and expansion of the pipes, it caused too many leaks. Our system is only a modification of it, using larger pipes and less of them, retaining the use of coils, however.

We have heated quite a number of houses, and dwellings houses also on both tank and closed plans of pressure without any marked difference, both ways proving eminently successful, comparing with other ways of heating.

Needham, Mass. DENYS ZIRNGIEBEL.

New York.

Trade with both wholesalers and retailers is worse, if possible, than ever. There is really nothing to do for half the men employed. This would not cause any comment if it was four weeks later; it is the fact of its coming so early in the season that gives it its significance. Outdoor bloom is being received in enormous quantities and while it does not bring enough in most cases to pay express charges it is a decided injury to the legitimate greenhouse stock.

Siebrecht & Wadley are much pleased with the reception which their new rose Belle Siebrecht has been accorded by their customers this season. Many baskets for dinners and other occasions have been made of it. It has proved a great keeper and the color always good, lights up gloriously by gas or electric light. It is coming now with strong stems and fine foliage.

Among the choicest flowers now being received are blooms of Cattleya Trianæ of the grandest forms and great variety of coloring. In the simpler stock are to be found yellow Sweet Sultan, campanulas, etc., which seem to be as highly esteemed as their more showy companions.

Mr. Thos. W. Weathered will sail on his customary summer visit to England on May 23.

Mr. Francis Fell of Tottenham, London, is in town.

Boston.

The demand continues very light and irregular in the cut flower market. Much of the stock coming in finds its outlet through the street fakirs, who get it at their own price. Ten Mermets for a quarter is the standard price on the street corners at present. Figures are tending downward on everything. Outdoor valley is very abundant. Sweet peas are sold as low as fifty cents a hundred.

James Comley is planning a Japanese garden. It will comprise about two acres of ground and will reproduce as nearly as possible the peculiar features of ornamental gardening as followed in Japan, with bridges, grottos, arbors, dwarfed trees, etc. A tacsonia raised from seed procured by Mr. Comley in Japan is now flowering. The blooms are large, pale rose, and borne in great profusion.

P. B. Clapp will add 5000 feet of glass to his establishment in Dorchester this season. Lord & Burnham have the contract for the houses, which will be of iron frame work with iron benches and best construction throughout.

A long disputed point has at last been settled by the compulsory removal of Galvin Bros'. Back Bay store from the Hotel Vendome. Stipulations in the deed of the property which forbid the encroachment of any business upon Commonwealth avenue property are the cause.

Bowditch & Co. will also be obliged to find a new location within a few months, as the Tremont House in which their store is located is to be torn down to make room for a large office building.

The greenhouses of Charles Fottler at Dorchester have been taken by the city, the route of one of the new boulevards passing right through the property.

Mr. C. M. Atkinson exhibited some finely bloomed plants of Cattleya Mossiæ, Lælia purpurata, dendrobiums and odontoglossums at Horticultural Hall on May 19.

A. W. Crockford, of Medford has made an assignment to D. Pendergast, of Malden.

D. F. Grant, South Boston, has also failed.

Chicago.

The sudden drop in temperature has had the effect of shortening the rose crop. The careful grower has of course resumed firing and no bad effects in quality are as yet apparent. Speaking of quality, however, roses, with few exceptions, are rather poor. Carnations also are getting smaller, although the quantity sent in seems larger than ever; the demand for these is very light at present. Pæonies, which are now received in large quantities from southern Illinois and Indiana, are a drug in the market. The best selected go at $1 for 3 dozen, though last year this same stock brought easily 75 cents per dozen.

The whole market is in such chaotic condition that there is no longer a settled price for anything. Nominally the wholesale men quote stock at last week's figures, but the demand both local and shipping is so light that there is no pretense of sticking to settled prices.

Retailers without exception agree as to this spring being the dullest season ever experienced.

Jos. Curran had a novel dinner decoration which was given by the Fellowship Club at Kinsley's. The tables were set under a tent erected in the ball room, a la Turk. Around the tent a border of green sods about two feet wide was laid. The space between this and the walls of the room was spread with gravel and sand, in effect to carry out the idea of an oasis in the desert. The corners of the rooms were banked with fine groups of palms. The table decoration consisted of a profusion of white pæonies set in vases (the table linen being red), making a fine effect. The guests entered over a gravel path which was flanked on either side by a magnificent vase of American Beauties.

The Lincoln Park board has reorganized with Andrew Crawford as president. In a recent interview with a reporter for a daily paper Mr. Crawford is reported to have said that he thought highly of Superintendent Pettigrew, but still more of harmony in the board, and that therefore Mr. Pettigrew would have to go. This announcement is the most remarkable of the series of wonderful explanations that have yet been made in this case. The old board was unanimous in resisting the governor's demands that Mr. Pettigrew be removed to make a place for an "engineer." The governor therefore removed the commissioners who had the manhood to refuse to execute his behests and appointed men who would. And now Mr. P. must go in order to preserve "harmony" in the board. In view of the facts, well known to every reader of the daily press in this city, such a statement is an insult to the intelligence of the people such as we did not expect, even from the representatives of "Supreme Park Commissioner" Altgeld.

In the meantime Mr. Pettigrew has received offers of positions at much better salaries than that he has received as superintendent of Lincoln Park. A change will mean for him increased financial returns, but his heart was in his work at the park and he takes his leave sadly. Chicago will be the great loser and the name of Altgeld will be execrated for years by all friends of horticulture in this city, and, indeed, in the whole west.

For the next two years this man will have control of the north and west parks, and the damage that will be done in that time by "political engineers" can hardly be calculated. But when his term expires there will once more be an opportunity for progress, for Altgeld could never again receive the nomination of his party, to say nothing of its vote. A most significant fact in this connection is that the club of German-Americans which was a prominent factor in securing his nomination two years ago has since repudiated him utterly and absolutely, the feeling being most conclusively shown by a heavy adverse vote upon an application by one of his friends for permission to hang his portrait in the club's gallery of prominent German-American citizens.

Battery D has been selected for holding the chrysanthemum show of 1894. The battery is now much better adapted for the purpose than formerly, as during the World's Fair period it was well finished off inside for use as a concert hall. During all last summer it was known as the Trocadero theatre. There is a feeling among the members of the Horticultural Society that no effort should be spared to make the show fully equal to, if not better than the World's Fair show of last year, and the affair will be laid out on most liberal lines. The show will last a full week, with fresh competitions almost daily. The prizes offered are worthy the attention of every grower in the country and in the cut flower classes there will undoubtedly be entries from a considerable distance. Competition is open to all. The show will be very liberally advertised and the management will be disappointed if the attendance does not equal or exceed that of last year.

Our announcement in last issue that an appropriation had been made for new conservatories in Washington Park was a little premature, though the report was given wide publicity in the daily press. We are advised by Supt. Kanst that "The commissioners had talked of building and had thought of spending in the neighborhood of $75,000. Mr. D. H. Burnham has been instructed to submit plans but no appropriation has been made as yet."

The South Park Commissioners have been considering plans for the improvement of Midway Plaisance, which was left in pretty rough condition after the World's Fair. They have finally adopted a plan prepared by Frederick Law Olmsted which provides for the conversion of the plaisance into a canal and boulevard connecting Jackson and Washington Parks. The canal, which will be 100 feet wide, will connect the lagoon in Jackson Park with the water in Washington Park, so it will be possible to go by water from Lake Michigan to the center of Washington Park. This will be a charming water ride on the electric launches that were so serviceable during the World's Fair. The island in Jackson Park will remain as it was during the Fair. The bridges where streets will cross the Midway canal will be of orna-

ILLUSTRATION NO. 3.
ARRANGEMENT OF FLOWERS.

mental character, and on either side of the canal will be two driveways, each 40 feet wide, with boulevard planting. Unfortunately the Illinois Central railroad objects to having a water course run under their tracks and will fight the project, but the commissioners are so sure of final victory that they have adopted the plan regardless. Until the legal fight is finished the space reserved for the canal will be devoted to lawns.

Mr. S. A. Wolcott, of Batavia, was married May 16. The bride was Mary L. Emerson.

Baltimore.

The last meeting of the club was fairly well attended in spite of the planting season being on us, and several questions were debated with vivacity. "What does it cost to grow coleus?" was answered finally by a member offering to grow for $20 per thousand all needed by another who had stated four cents as the cost of producing good plants. Then the question of budded roses was taken up, with a question of ethics tacked to it, by some one who asked "Is it right to sell budded roses without telling the purchaser they are budded?" Of course, the point of the question lay in whether a budded rose is better, worse, or equally as good as one on its own roots, and probably the seller will quiet his conscience if it gives him uneasiness, by persuading himself that at least there are doubts on the subject, even among the membership of so learned a body as the Gardeners' Club.

The cut flower season is about over; here and there, a little life is shown in the market on account of a society event of some kind or other, but in the main the events calling for flowers of fine quality are sicknesses or deaths, the bulk of the flowers purchased for other purposes being out door flowers, sold in the markets.

Plant trade seems much as usual, possibly something of a falling off from previous years, but not enough to seem serious, not even as much as might have been expected considering the stringency of the times, and the numbers of people out of work. MACK.

Washington.

The market florists report trade in bedding plants as being unusually good. Clark Bros., say they have never had such a good season. Prices are keeping pace with the demand and all seem to be happy over the spring rush.

The cut flower trade is holding its own and will compare favorably with other seasons, though the markets and streets are flooded with spring stuff. Roses are excellent in quality and plentiful, but the prices are down in consequence of so many being peddled about the streets.

Hybrid roses at the Botanic Garden, and in fact throughout the city, are remarkably fine and in great profusion this season. They were not far enough advanced at the time of late frost in April to be affected as were many of the other hardy flowering shrubs.

Weigelias are now in full flower in the parks. They show perceptibly the effects of the late cold snap, many of them being killed half way to the ground. They were fine old specimens and would have made a grand display but for the nipping they received. Viburnums have been very fine, yielding more flowers this season than ever before. Hydrangea paniculata grandiflora is beginning to show buds which promise a grand display. They are grouped in some of the reservations and the effect is very beautiful when they are in flower. The collection of German iris at the Botanic Garden is in full flower, making a very attractive feature. I am surprised that some of the varieties of this class of plants are not more generally grown. The flowers of some of the irises are almost as handsome as orchids and are far more fragrant than the majority of orchids. The admirers of these flowers would be well repaid if they could stroll around the borders of the garden at present. Later we will have a fine display of the Japanese varieties. Among these are some very fine flowering ones; they were presented to the Gardens by Mrs. Senator Wolcott, of Colorado (who is a great lover of flowers), who imported them direct from Japan.

The parks are all in excellent condition this season with the exception of one or two of the larger reservations, where the grass has not been kept cut owing to the lack of appropriations for that purpose. Mr. G. H. Brown is pushing the bedding in the parks with the slim force at his command: they have over 100,000 plants out, of which 80,000 are geraniums. Should the weather be favorable Mr. Brown expects to finish the bedding next week, except the K. of P. badges.

The horse chestnut trees which are planted on 13th street from P street to Fla. avenue, N. W., a stretch of about ¾ of a mile, are simply perfect this year, owing I presume to the mild European-like winter. They present a beautiful picture at present, being covered with long spikes of white flowers, with a back ground of rich foliage, giving forth per-

fumes for squares. This reminds one of a trip to Busby Park, near London, where the "Cockneys" go when this tree is in flower, to get a sniff of fresh air and to admire the beautiful. Some forty years ago as many as 6,000 people would go to see this magnificent avenue, a mile in length, the trees being about 80 feet high. But they were planted a little too close, which is a mistake generally made not excepting the Parking Commission of Washington. The horse chestnut should be planted when small, as it is a deep-rooting tree, in fact it would be far better if the seed was planted where the tree is intended to remain (as is best with most of the large seeded trees). The Parking Commission made a strike when they selected this tree for 13th street as the most of that street from P street to Boundary has been deeply filled with fairly good soil (a portion of it was once a fine market garden) thus enabling them to send their roots down to a considerable depth. While this is not a rapid growing tree as compared with other varieties planted on our streets its symmetrical form, handsome foliage, and beautiful flowers more than make up for its slow growth. On the west lawn of the Capitol park stand several fine specimens of this tree, which are more than 50 years old and when in flower they are much admired by the thousands of visitors who find their way to the Capitol at this season, particularly when Congress is in session.

Mr. J. R. Freeman, who has been so dangerously ill, is slowly improving, though he is yet a very sick man. His many friends will be glad to see him out again. May it be very soon.

REYNOLDS.

Buffalo.

As predicted in my last a very pleasant time was spent with Mr. Long at his annual opening on Tuesday last. "Reception from 3 to 5; bowling from 5 to 7;" something like that the invitations read. Mr. Long had his several apartments swept up in very orderly fashion and the sweetest smiles were worn by Mr. L.'s lady clerks. All these little things count. The bulb room had the greatest attraction for the visitors and on entering it, which the writer did rather late, he found the reason very evident and visible. On a long table were spread dainty sandwiches, delicious ices and cakes, and presided over by a most cultured colored gentleman. At the end of the table was a liberal sized punch bowl. There were other kinds of refreshments for the more plebeian taste. As the hour to adjourn to the bowling alley drew near Mr. Long briefly thanked us all for our presence and hoped that another year would see all again assembled for the same purpose and with the same mutual good feeling. Thanks for such a pleasant hour were well worded by Messrs. Constantine, Scott, Cowell, Fry, and President Adams, some of the speakers reviewing the business of Buffalo for the past 20 years and wondering how we could now get along without our commission man. Mr. Cowell's closing remark met with unqualified indorsement. It was to the effect that Mr. Long's "openings" should be monthly in place of annual. Mr. Fry came all the way from Rochester, and several other towns were represented. Every florist in the city should have been present. W. J. Palmer, Sr., was missed. He always adds *solidity* to an affair of this kind but of course the punch went much farther. What's the matter with Christenson, Belsey and Buxton? Want of time is no excuse, for anyone of them will spend more hours on a slight excuse at something not half as enjoyable. Mr. L. had engaged the three fine alleys of the "Silver dollar" and for several hours there was great timber felling. The game was greatly enjoyed by old and young. The only feature of it was that the grayheads and baldheads made much the largest score. Cowell, Mepsted, Scott and "Warhorse" Constantine were on top. Long scored high. Nolan, Rebstock, Barth, Eggert, were in the rush with several more, while Fry, Adams and Milley brought up the rear.

Business is reported as fair. Outside valley is in its prime but will soon be gone. Roses still quite good. Outside tulips are plentiful but not in great demand. There are plenty of carnations and they retail at 30 to 40 cents per dozen. Daybreak is scarce and many more could be sold. Puritan is the white for the spring months; it beats them all, but no one here can get many flowers from it until February. At present Palmer, Constantine and Scott are picking large quantities of extra fine flowers of it.

The most elaborate wedding of the season occurred on Friday on our aristocratic North street, when the daughter of George L. Williams was married to Mr. Keefe. Trinity church was most lavishly decorated with palms and Harrisii lilies, and the same features were carried out at the house. The entire spacious veranda was inclosed with netting on which was fastened laurel (kalmia). In several of the rooms were handsome banks of palms with lilies everywhere. The staircase was trimmed with asparagus with here and there a grand bunch of orchids. Mr. Thorley supplied the bride and maids' bouquets and brought the flowers and made them here *himself*. Scott did the decorations at the house and church. The bride's bouquet was 5 or 6 dozen Niphetos. The bridesmaid's bouquets were of Mermets.

W. S.

Cleveland.

A hail storm of unusual severity paid our city a visit on the 17th inst., doing more or less damage to greenhouses, skylights and windows. For size of hail and duration of storm it was unequaled. Some of the larger pieces of ice that fell measured from eight to twelve inches in circumference and were generally flat in shape, not unlike a common door knob in appearance. Some idea of the force with which the stones fell can be had from the fact that in places the sash bars were dented and fractured, and heavy corrugated glass (in skylights) that was over a fourth of an inch in thickness was broken. The hail fell for about twenty minutes and was followed by a heavy downpour of rain, which added to the general destruction in the greenhouses.

The florists on East Prospect street appeared to be in the center of the storm, as there the destruction was most complete.

Harry Jaynes lost about four-fifths of his glass, and a large number of plants are damaged by broken glass. When he was asked about repairing his houses he said he had not quite decided but thought he would give up the present houses and build a new plant outside the city limits.

At Robert Hughes' place the loss in glass was complete, as only here and there was a whole pane left. His loss is about 10,000 feet. Heliotrope, fuchsins, coleus and other soft stuff was ruined by the falling glass.

The destruction at F. C. Hills' greenhouses was also complete. He lost about 8,000 feet of glass and all his stock of bedding stuff is more or less damaged by the glass and heavy rain, for to make matters worse the storm has been followed by two days of cold rain.

All of the above florists were uninsured, so the loss will be complete. Mr. Hills carried hail insurance for several years and then dropped it. Just now he would feel better if he had kept it in force.

Archibald Campbell, on Cedar avenue, lost about two-thirds of his glass.

Charlesworth suffered in like amount at his place on Sibley street, while his houses on Doane street were damaged to a greater extent.

The splendid range of houses at J. H. Wade's private place were completely ruined, as were also quite a number of smaller places.

James Eadie lost only about 2,000 feet, as they did not get the full force of the storm.

The loss at the Gordon greenhouses was very slight as they were nearly outside the "Hail Belt" this time.

In West and South Cleveland there was very little damage done, and at J. M. Gasser's rose house on Lake avenue there was no glass broken, while at his general greenhouses, five miles further west, there was no hail at all.

This would be a good territory for an agent of the Florists' Hail Association to visit just now.

We also learn that our neighboring towns received a like visit the same day. A wail comes from Canton, but we could not ascertain how much damage had been done.

L. F. D.

Toronto.

The lecture given by Professor J. Hoyes Panton, of the Ontario Agricultural College, Guelph, at the regular meeting of the Gardeners' and Florists' Association, on "Parasitic plants and how to overcome them," brought out a goodly crowd of members and their friends, all of whom went home saying that it was the best and most instructive meeting the Association has ever held, and thoroughly convinced that a move in the right direction had been made in starting a course of scientific lectures.

Professor Panton has the happy knack of making what looks like a dull subject to most people very interesting to folks of moderate education as well as to those who have had more privileges, using language so simple and plain that a school boy could take everything in and digest it.

The lecture was given quite extempore and was illustrated by diagrams of highly magnified specimens of the various plant parasites that are troublesome to gardeners, farmers, etc., in their various stages of development. The professor emphasized the fact that "prevention is better than cure" and said that the best preventive was to "*clean up and burn*" all rubbish likely to be affected or that would harbor spores.

Bordeaux mixture properly made and applied was the best thing to destroy the fungi and prevent it from spreading. Here is his receipt for the mixture, which may be useful to many: Five pounds sulphate copper, four pounds lime, forty gallons water. Dissolve the sulphate copper in two gallons of water, then slack the lime, which *must* be fresh and good (this is important) and strain it through a coarse cloth into the sulphate copper water, then pour in the rest of the water and you have Bordeaux mixture. Half a dozen other mixtures were also mentioned.

The professor now intends to make a particular study of the carnation rust and violet disease and proposes to come down again and give us the benefit of his investigations.

Bedding out will probably begin next week in earnest. As yet only a few small private places have planted anything out. The weather has been cool and wet the last few days, with a probability of some cold nights in the near future.

The Park Superintendent has appointed Mr. E. H. Carter as care-taker of Riverdale Park. The appointment is a good one.

Store trade amounts to very little these days and times generally are very dull, every one economizing. However there are signs of gradual improvement. Toronto is all right, merely a slight temporary indisposition. E.

Philadelphia.

At the last meeting of the Pennsylvania Horticultural Society Mr. Clark, on behalf of the syndicate who are to advance the greater part of the funds to rebuild the hall, stated that he would advise that no active work except that of a preparatory character be commenced until the fall. It seems that a snag has been found in some old bonds which were issued on the hall years ago, but which were wiped out when the property was sold by the sheriff, and bought in by Mr. Schaffer, who held the mortgage against it. It seems that these bonds still stand against any property the society may become possessed of, and if the hall is built as proposed and there is any revenue derived therefrom it might be attached to satisfy these bonds. It was advised to look up the bonds, wherever they could be found, as they are not now of any value, and have the present owners turn them in, so that they should not fall into the hands of third parties who might harass the society. It was also thought well to prepare plans and have the architect selected so that active work could be commenced in the fall, after the vacation season. Quite a number of new members were added to the society, which shows that interest in its work is still being taken by the public.

There are quite a number of more or less elaborate designs made of Cape flowers and immortelles for Decoration Day, Mrs. Wolfe of Broad & Columbia avenues has a large number of these pieces, many of them original designs; they are ordered by business houses, who present them to the various Grand Army posts for use in their memorial services Decoration Day.

Business is very dull, American Beauty roses seeming to be the only flower for which there is much demand; these are to be had at from $1 to $3 per dozen. Sweet peas seem to sell well and bring from $5 to $10 per thousand; cornflowers 75 cents to $1 per hundred. Pyrethrum in various colors sells for $1.50 to $2 per hundred. Harris had a very pretty dark red pæony without a name, very early and a good seller. Mr. Harris is sending a car load of plants to Boston to be sold by Mr. Hatch; the sale will take place next Saturday, 26th inst. The stock is his very best.

Jacob Becker is busy with his chrysanthemums, and from the looks of his stock he will have a very fine lot of plants next fall; they are all to be grown in pots. He has a house planted with La France and another of Marie Guillot for summer cutting.

Growers for sometime have been importing palms from Europe, but now the tide has turned, as a short time ago Mr. Henry A. Dreer sent over a large lot of small latanias. In these days of rapid ocean transit it will no doubt soon become common for florists of the new and old world to exchange stock with one another.

Robert Cranford, M. Rice, of Marchentz & Co., and Eugene Weiss are becoming great bicycle riders, and forty to fifty miles a day is as nothing to them. A trio covering over forty miles was indulged in one day recently by this trio, who report having had a splendid time. Perhaps in addition to the bowling contests at the annual convention we may have to add a race or two on the wheel, as should there be "others" in the trade, and we think it likely, who are fond of this sport, they will soon want to know who is the best, and they should be given a chance to find out by all means.

This vicinity was visited by a violent thunder storm on Thursday last, accompanied by high winds, but not much damage was done, although there was considerable hail, which damaged some flower beds recently planted.

Bowling matters are now getting very interesting, and the attendance at the practice games for the next month or so will be large, and the interest intense; the big four will be sure to be on hand. K.

Pittsburg.

Trade still moves slowly in this city, with a supply of plants equal to all calls. Much bedding out has been done. In the early part of the week the weather was fine, but for the last three days it has rained continuously, and to-night (19th) the thermometer is down to 40° and it is still raining. I am afraid that the tender bedding plants will have a sore appearance when it clears away and many will have to be replaced.

Cut flowers are in fair demand and plentiful. Extra fine carnations fetch $1.50 per 100. Smilax scarce.

E. H. Beckert has opened a store on Penn avenue, East End. He was formerly with Duff Bros.

Jno. R. and A. Murdoch have been quite busy the past week with funeral work.

Next Monday will witness the opening of what promises to be the largest state conclave of Knights Templar ever held in Pennsylvania. The decorations are in the hands of Elliott & Ulam, who have been kept busy for the past week making dry work.

The parks will commence bedding the present week, and as the Grand Army will hold its encampment here, a great many appropriate badges will be made.

Worcester, Mass.

The season is so far advanced this spring that all outside stuff is very much earlier than usual, consequently there was a lack of entries in the classes that called for outside culture at the May exhibition of the Horticultural Society.

Although tulips were shown in goodly numbers there was not the brilliant display that we would have had if the date of the exhibition had been changed to a week earlier. But one stand of hyacinths was shown, which contained some good spikes but were foolishly staged without foliage.

Pansies both in pots and cut were well represented, some very fine types being shown. Denys Zirngiebel, of Needham, Mass., showed two stands of blooms which attracted considerable attention from the large size of the flowers and the peculiar marking.

Probably the baskets of cut flowers attracted the most comment; there being no restrictions some fine pieces of large proportions were shown; the display of hand bouquets was very disappointing as they were made up in very poor shape and were anything but artistic. The stands of cut flowers were very good and contained some excellent blooms, which were staged so as to bring out the different colors in a harmonious blending that was very effective.

There were but few entries in the pelargonium class and the plants exhibited were only medium in quality and not well bloomed; there was a very good attendance.

First premiums were awarded to Edward Hall for tulips, cut pansies, vase of tulips; to H. A. Jones for pansy plants, pelargoniums; to H. F. A. Lange for basket and stand of cut flowers; to W. J. Wood for bouquet.

The date of the next exhibition is June 7, and begonias, irises, clematis, fuchsias, rhododendrons, azaleas (Ghent) and cut flowers are scheduled.

Business has been very fair, the daily sales reported being but a little under those of last year. First class stuff is plentiful and regular prices prevail. There will probably be a shortage of flowers for Memorial day as a great deal of outside stuff such as valley, Narcissus poeticus, myosotis, lilac, etc., which always helped us out on Memorial day, will have done blooming. SEEDLING.

St. Paul, Minn.

The week has been one of activity in florist circles. Starting in warm and bright and the heat increasing until the mercury went up to 90° in the shade, everybody became anxious for their beds to be planted and vases filled. On Thursday however it turned suddenly cold, the wind blew a blizzard from the north, and tender plants outside suffered accordingly. Frost on Friday night nipping many gardens and unprotected plants has checked the sudden desire for bedding and vase plants to be put out.

During the week heavy downpours of rain, supplemented by hail beat everything flat before it. We learn of no damage to glass by hail in St. Paul, but have been informed that considerable damage was done in Minneapolis.

Stock about town is abundant and fine. May & Co., Hansen, Warren and Lemke, all have fine geraniums and all report good sales. Some very fine pansies are also seen, retailing at from 30 to 50 cents per dozen. Many of the small florists are now reaping their only harvest of the whole year, selling potted plants on the market, peddling them on the streets and planting them out in lawns and cemeteries.

Department stores and cigar stands are also offering plants and with so many avenues for disposing of their stock the growers will be able to sell everything.

In cut flowers, sales have been up to the average. Owing to the warm weather the fore part of the week, roses were a little off in form and color, but everything sold readily and notwithstanding the enormous number cut they all sold. The department stores are now selling them daily and this may account for there being no surplus on hand.

Some nice carnations are still seen. C. Hansen and C. I. Warren are cutting some very fine Silver Spray. This carnation, besides being a very free bloomer

and good keeper, never bursts its calyx, has a moderately stiff stem and is a great favorite here. We think it the finest white ever grown here and it will be planted largely the coming season by our florists, as will Daybreak and Portia.

Some carnations are already planted out and with a good long season in which to grow should make excellent plants for the benches next fall. Sweet peas and gladioli are also coming on nicely outside, in fact all vegetation in this section is fully three weeks ahead of the average, and Dame Nature seems to be doing her best to assist the poor florists after a long period of depression in business.

A word about selling flowers at bargain prices when stock is plentiful. This we know has been practiced and quite successfully by one of the brethren in Minneapolis. But we are under the impression that if this rule be adopted at all it should be only after due deliberation. In no line of trade have prices dropped more than in the florist line the past five years. This has been due solely to competition, and prices now are as low as the stock can be sold at profitably. In advertising bargain days and in selling stock at cut prices, it should be impressed on the minds of the buyers that the prices are made solely on account of the immense stock and the perishable nature of it. After all, hadn't we in the large cities, better leave cut prices to the street fakirs and department stores. They always imply inferior goods. Customers never approach such sales without a feeling of doubt as to their being genuine. One thing might be done to advantage. That is two grades of flowers, roses especially, might be made. All the large, firm, long-stemmed buds in one lot, the short, weak and puny in another.

E. F. Lemke's new houses are now well under way, he having torn down part of the old range to make room for them. When completed his range of houses will be new throughout and one of the finest in the city. Friend Lemke knows how to grow good stock and a complete range of new and modern houses will add greatly to his producing facilities. His trade is one of the oldest in the city as well as one of the best. FELIX.

St. Louis.

Stock has been very abundant during the week, and of exceptionally poor quality owing to the extreme warm weather. The cold snap that arrived here on the 18th had a chilling effect upon everything, cut flowers falling away until there was scarcely enough to go around. Peonies have made their appearance in quantity and are slow sale. Bedding out has progressed rapidly in all the parks, and the beds that scarcely two weeks ago were gay with bulbous stuff, have all been prepared for their summer display. Quite a number of new beds have been made in Forest Park and the display this season will be fully 50% greater than that shown last year.

G. R. Fisher has opened a retail store in St. Louis. R. F. T.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head

SITUATION WANTED—As assistant gardener and florist, 6 years' experience in all branches; good references. E. ADEY, Flatbush Station, Brooklyn

SITUATION WANTED—A-1 floral artist, designer and maker up, over 20 years' experience; best reference. Address S S, care Am Florist, Chicago.

SITUATION WANTED—By young woman to learn general greenhouse work; Wisconsin or neighboring states preferred. Address [illegible]
MISS MIRIAM JEWETT, Sparta, Wis.

SITUATION WANTED—By a young man, age 25, as general greenhouse assistant; 4 years' experience. Thoroughly reliable and sober. Address
FRANK, care American Florist, Chicago.

SITUATION WANTED—By first-class florist and gardener, well up in all branches, as foreman; German; single, best reference; please state wages. Address A T M, care American Florist.

SITUATION WANTED—By single German, age 27, as greenhouse assistant on private or commercial place; 3 years' experience. Good references. St. Louis preferred. B E, care American Florist.

SITUATION WANTED—By a second man, commercial or private place. Well experienced also in landscape gardening. Wages moderate. Best references. F H H, 155 Harrison Ave., Boston, Mass.

SITUATION WANTED—By competent florist and gardener open for engagement. Please give full particulars in answer. Address
WM B K 908 Spring Garden St., Philadelphia, Pa.

SITUATION WANTED—By single man age 27; 9 years' good experience. Willing to do any work required in nursery or gentleman's place. State wages. F. HILL, West Porter St., Oswego, N. Y.

SITUATION WANTED—By a live young florist who is competent to grow roses, carnations, violets, mums, etc. for cut flowers: position as an assistant on a large commercial place preferred.
ARTHUR H. BOOL, Ithaca, N. Y.

SITUATION WANTED—By thorough practical florist and gardener; well up in all its branches; gentleman's private or commercial place. Roses a specialty. Very best references. Address
G W, box 38, Brooklyn Village, Ohio.

SITUATION WANTED—A reliable man, single, age 42, know about flower and vegetable gardening. Good milker and poultry man; wish situation with a respectable man. Address ULRICH,
care T. Wittig, Front St., Marietta, O.

SITUATION WANTED—By first-class designer, also willing to make himself useful in greenhouse if necessary; single man of 30; first-class references. Will work for moderate salary if steady place. Address C W, care American Florist.

SITUATION WANTED—By a gardener and florist; 35 years of age; life experience; 16 years in this country, as head gardener or manager; thoroughly versed in all its branches. Also in mushroom culture. Would like situation in any of the eastern states. For information or reference please address GARDENER, care Wm. J. Stewart, 67 Bromfield St., Boston, Mass.

WANTED—To purchase or rent a florist establishment in a city of 3,000 to 15,000 inhabitants; prefer central states. F. RENTSCHLER,
3861 Kosciusko St., St. Louis, Mo.

WANTED—At once, a good working foreman manager for growing roses, carnations, violets, for wholesale trade. Will pay good wages to right man. Address or call J M,
care E. H. Hunt, 68 Lake St., Chicago.

WANTED—A partner with small capital ($1000 or so) to begin business at an old and hitherto prosperous establishment in a general retail florist's and trucker's trade. For particulars address
B J, care American Florist, Chicago.

WANTED—A good all-round florist to grow roses, carnations and chrysanthemums and plants for market; must be a single man of good habits; state wages wanted, with board, lodging and washing; good steady job to the right man. Direct to
MOSES LARGE, 907 Grand River Ave., Detroit, Michigan.

WANTED—A PARTNER—To join me growing and selling native and foreign hardy ornamentals, to meet the wants of American and foreign customers. Trade already well established and growing. A Christian and a prohibitionist preferred. Must be competent for the business, and free from bad habits. Some capital needed. Guaranteed a first-class opening for the right man.
WILFRED A. BROTHERTON, Rochester, Mich.

FOR SALE CHEAP—Large second-hand florist's Ice Box, value about $75. VAUGHAN'S SEED STORE, 88 State Street, Chicago.

FOR SALE—A valuable florist establishment in good location. Address
Lock Box 802, Washington, Iowa.

FOR SALE—2 large Bay Trees, round heads, 7 feet broad, 12 to 14 feet high. Shown at World's Fair.
VAUGHAN'S SEED STORE, Chicago.

FOR SALE CHEAP—Large, new hard wood and glass florists Refrigerator. Used at World's Fair. Cost $250 VAUGHAN'S SEED STORE,
146 & 148 West Washington St., Chicago.

FOR RENT—A first class commercial place in suburb of Chicago, containing 15,000 square feet of glass, well stocked with best varieties of forcing roses. Address RENTER,
care Olsen & Hughes, 95 Wabash Ave., Chicago.

FOR SALE—The stock and good will of a paying florist business in a thriving Maryland town. Location exceptionally good. Rare chance for a good man with a small amount of capital. For particulars address HERARD, care American Florist.

FOR SALE.

At a bargain, the best retail florist place (1 store and greenhouses in the city and doing a good business; poor health reason for selling. For further particulars address H F HALLE, 548 W. Madison St., Chicago.

FOR SALE.

At a bargain, four greenhouses, 3 18x72 and 1 10x72; 4-roomed dwelling house and barn, situated on eight lots four blocks from electric cars. Building 3 years old. Greenhouses with the short slope to the south; hot water heating. For particulars address
PH. M. KEIPPER, Williamsburg P. O. Milwaukee, Wis.

DISSOLUTION NOTICE

Notice is hereby given that the co-partnership heretofore existing between Arthur Newell and Joseph N. Kidd under the firm name and style of Newell & Kidd and located respectively at Kansas City, Missouri, and Saint Joseph, Missouri, is by mutual consent this day dissolved. Mr. Arthur Newell will continue in the business as a florist in his individual capacity at Kansas City, Missouri, and Mr. Joseph N. Kidd will be located in the same line at Saint Joseph, Missouri.
Kansas City, Missouri, April 30, 1894.

ROSES.

Including Everblooming, Hybrid Perpetual and Hardy Climbing, all our selection, but standard sorts, $15.00 per 1000; 2000 in one order for $25.00.

GERANIUMS.

Double, Single, Scented and Ivy, at $15.00 per 1000, all our selection. We have one of the finest assortments of the Bruant type to be found in this country, a due proportion of these will be included in each order.

200,000 Miscellaneous Plants.

Embracing Begonias, Chrysanthemums, Coleus, Hibiscus, Sanseveria, Jasmines, etc., $15.00 per 1000, all our selection.

Write for prices on any special sorts that you may want. Catalogues mailed on application.

ADDRESS **C. A. REESER,**
SPRINGFIELD, OHIO.

Surplus Stock 50,000 Roses

We still have above number in prime condition and want to dispose of same at once for cash. It will pay every florist to plant out one or two thousand of these Roses, the cut flowers will more than pay the cost.

For $20 we will Express you 1000 Roses in following sorts—quality and safe arrival guaranteed:

Ct. de Labarthe, Bride, Mermet, Perle, Schwartz, Devoniensis, Therese Levet, Niveus, Golden Gate, Papa Gontier, Dijon, White, Pink and Red La France, Meteor, Mrs Degraw, W. A. Richardson, Pradel, Christine de Noue, F. Krueger, Cels, Queens Scarlet. Outside of these have 50 more sorts; leave selection to us and we can furnish at same figures. Send your lists to be priced

Address **NANZ & NEUNER, Louisville, Ky.**

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

W. H. MAULE is making an extended business trip in Europe.

THE HERRICK SEED CO., Rochester, N. Y., has been incorporated with a capital stock of $10,000.

SECRETARY DON is busy with the programme for the Toronto meeting of the Seed Trade Association, June 12. Prospects are excellent for an interesting occasion.

THE GENERAL IMPRESSION in the trade is that only those firms having a good local business have held their own this season and that those depending on the mail trade only have suffered most from the dull times.

A NEW horticultural establishment will soon make a strong bid for general business; Mr. J. T. Lovett, of Little Silver, N. J., has, it is rumored, associated with himself that well known specialist Mr. T. H. Spaulding, and the new firm will cover all lines in seed, bulbs, plants and nursery stock.

Sweet Peas.

Sweet peas sell well as choice flowers in winter and early spring and have been forced during the past few years in increasing quantity each season. They are among the easiest flowers to force and no particular knack is required in order to succeed with them. They should be sown early in September in rich soil where they are to remain. The better the soil the better the peas will be. A cool temperature is necessary if the best results would be attained. With a temperature not exceeding 45° at night they will keep stocky and firm. They want a full exposure to the sun and an abundance of air during the day when possible. In spring they will require a great deal of water. Up to date Blanche Ferry has proved the best grower and the best seller. Next to this in value come the pure white varieties. Other colors have so far met with but a limited demand.

DO YOU WANT a list of the cemeteries of the country that use trees, shrubs and plants largely in the ornamentation of their grounds and that are apt to be large buyers of these and other horticultural supplies? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

DO YOU WANT a list of firms in the trade that issue catalogues, with key showing proportion of space given each branch of the trade in same? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

CHEAP FLOWERS

During the whole season from Christmas up to Easter.

There are thousands of people who at Easter time want to purchase a plant, but their limited means won't allow them to purchase an Azalea or even a dollar Lily. They want some little plant for 25 cents, and this should not be lost sight of. A Dutch Hyacinth or 4 to 5 Tulips or Daffodils in a 4-inch pot fills the bill.

Rich and poor alike will buy a flower for Easter. Hard times or prosperity—free trade or protection—won't affect it.

SEGERS BROTHERS,

WHOLESALE BULB GROWERS,

LISSE. near Haarlem, **HOLLAND,**

Offer HYACINTHS, TULIPS, DAFFODILS

And all other bulbs for forcing and outdoor, in extra fine quality, at very low rates.

ASK FOR OUR 1894 CATALOGUE.

Orders Booked Now

Base Ball.

The employes of Hitchings & Co. are going to decide a game of base ball on Decoration Day, near their works at Arlington Ave., Jersey City. The N. Y. boiler shop will compete with the foundry men of the Jersey City branch. This should be an interesting game as there are some expert players among them. After the game there will be a 100 yards dash between Pat Burns and John Davie. Burns has a record of 1-08. ROBERT HOOD,
Capt. N. Y. Team.

Queer Place for a Key.

A sign in the window of a vacant store in a western city reads: "To rent; key in florist next door."

Do you WANT a complete alphabetical list of carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

DWARF CALLA.

Something that every florist who sells potted plants should have, as this variety of Calla never grows large, and therefore, for window or house culture has no equal. And again, in cut flower work its size makes it a flower that a cut flower dealer cannot well do without. I have several thousand of these Callas in 3, 4, 5 and 6 inch pots which I offer for sale. Correspondence as to price etc. solicited

LEWIS ULLRICH, Wholesale Grower of Cut Flowers and Smilax, TIFFIN, OHIO

Do you WANT detailed information about the organization and workings of the various national trade organizations? You will find what you want in our trade directory and reference book for 1894. Price $2 00.

American Beauties.

One thousand extra strong 2½-inch pot plants, @ 6.00 per 100.

A Losing Game.

ED. AM. FLORIST: Up to a year or two ago this used to be a very good flower town. The prices were good, roses sold at from $1.50 to $2 per dozen, hardly ever at any time of the year were they less than $1 per dozen, and the same could be said of the plant trade, but now the prices, of cut flowers especially, are about one-third of what they used to be. I will give you the reason for this, just to show what a damage to the trade one man can be. There were, up to two years ago, four greenhouse concerns here, now there are five. This last concern is the one that has been the detriment to the trade in this city. He has established a downtown store, and advertises roses for twenty-five cents per dozen, American Beauties at that. He could sell just as many at $1.50 or $2. He has also cut the price on floral designs in a like proportion. Of course he is playing a losing game, but while he is doing so he is also doing a great damage to the trade.

The above comes to us signed by all but one of the florists in a live little city in a central state. Can any of our readers suggest a good way to meet the sort of competition described?

MR. J. C. RENNISON, of Sioux City, Iowa, has issued a very attractive catalogue covering all the divisions of a general business that is worthy of special note. In addition to the lists of plants, which are adorned by handsome and accurate illustrations, he gives also approximate retail prices on loose cut flowers and floral arrangements. In this latter department he includes handsome engravings of bride's bouquets, a dinner table decoration, table center piece and a daintily arranged basket. The whole effect is excellent and the circulation of such a generally attractive pamphlet should surely bring business.

IN THE May 15th issue of *Gardening*, Chicago, appear excellent illustrations of Magnolia conspicua, and Xanthoceras sorbifolia. Of the latter valuable shrub there are engravings of a specimen in bloom, a spray of flowers, and a cluster of ripe fruit. *Gardening* easily maintains its position as the most valuable American horticultural publication for amateurs.

DANIEL B. LONG, the Buffalo wholesaler, gets out some very attractive printed matter. In connection with a recent price list he reprints the telegraphic code adopted by the S. A. F. some 7 or 8 years ago. This reminds us that the code has been permitted to drop out of sight a little of late. As it is a money-saver to everyone ordering flowers by wire it would surely pay the wholesaler to keep the code in circulation. It pays to make it easy and inexpensive for customers to order.

BUILDING.—Readers who contemplate building additional greenhouses, or remodelling old ones, this summer, will confer a favor by reporting their intentions to us. We are anxious to have as full a record as possible.

TRY DREER'S GARDEN SEEDS,
Plants, Bulbs & Requisites. They are the best at the lowest prices. Trade List issued quarterly, mailed free to the trade only.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

News Notes.

MONONGAHELA, PA.—I. Shelby Crall is building two new rose houses 18x135.

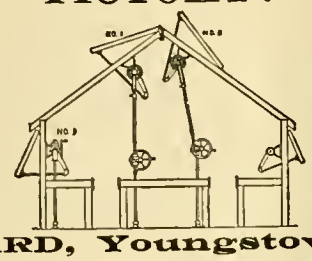
BATAVIA, ILL.—Mr. S. A. Wolcott, of the Bellevue Place Co., and Mary L. Emerson were married May 16.

PORT HURON, MICH.—Mr. M. Ullenbruch reports a loss of 8,000 square feet of glass and $3,000 damage to plants, vegetables and glass on Lapeer avenue greenhouses by the storm of May 17. On city greenhouses loss of $250.

KALAMAZOO, MICH.—The storm did no serious damage here. Some of the florists lost a few lights of glass, but nothing to worry about. Mr. Joseph Dunkley has been confined to his bed for the last ten weeks with pneumonia. He is still so weak that he cannot stand alone, but is improving.

SALEM, MASS.—The beautiful memorial chapel and conservatory at Greenlawn Cemetery which was presented to the city by Mr. Walter Scott Dickson in memory of his wife, was dedicated on Saturday, May 19. The conservatory, which is 50x35 with an extreme height of 28 feet, was built by Thos. W. Weathered's Sons. The frame work is of iron, and benches of slate.

NEVADA, MO.—The premium list for the third annual chrysanthemum fair, to be held Nov. 14 to 17 under the auspices of the Epworth League, has been issued. Copies may be had on application to C. W. Talbot, the florist. The League has secured special rates from the railroads for the week of the exhibition and will spare no effort to draw visitors from the surrounding country. The event will be very liberally advertised.



DETROIT, MICH.—The usual spring epidemic of flower thieves is infesting this city; parks, private residences, and nursery plantations alike have had their choicest flowering shrubs hacked and torn to pieces by these vandals. But patience has ceased to be a virtue, and the park and cemetery officials recently gathered in a wagon-load of these thieves, while Stephen Taplin, whose nursery on Fort street has been stripped every year, has started a vigorous campaign, being determined to prosecute in every case. It is to be hoped that these measures will check the evil.

DECATUR, ILL.—The worst hail storm ever known in this part of the state struck here May 17. Hail stones as large as baseballs were picked up (and photographed to convince skeptics). Among the florists N. Bommersbach suffered the most damage, losing 2,600 14x20 lights of double strength. Adam Balmer lost about 1,000 12x14 lights, and the other places suffered more or less severely. The cold weather that has prevailed since has caused serious damage to tender stuff. This misfortune in connection with the hard times is enough to give any man the blues.

Messrs. Kroeschell Bros.
41 to 55

Chicago.

Gentlemen:—Last season we purchased three of your Improved Green House Boilers. They have done heroic service the past winter—eclipsing every claim you made. Since Feb. 25th one large boiler has been doing the work of two, heating six houses 185 ft. + 24 ft., with 9 pipes (4 inch) each; i.e. about 26000 square feet of glass, the hot water being forced through nearly two miles of 4 inch pipe. While the weather has been mild we doubt this showing can be excelled. Needless to add your boilers please

Yours Very Respectfully
Brant & Moe.

Is it Wise Policy?

Is it right for florists to advertise wholesale prices in papers that have a general circulation? I have noted several wholesalers who advertise the same prices in papers that go to the general public that they quote to florists in the trade press. Is it not plain that such work hurts the local florist? On several occasions people have told me that they could buy plants from a certain florist for exactly the same prices he asks those in the trade. This is certainly unfair to the retailers and it would seem that the latter should withdraw their trade entirely from such houses. I, for my part, will not deal with a man who makes no distinction in prices between those in the trade and those who are not, and if all retailers took the same stand such parties would be forced to do either a strictly wholesale or a strictly retail business, and a little experience in doing a strictly retail business at wholesale prices would probably be sufficiently unprofitable to teach them a wholesome lesson. By what process of reasoning they arrive at the conclusion that they can sell direct to my customers at wholesale prices and then sell to me also at same rates is a mystery to me. Do they imagine they can eat their cake and still have it? It would seem so. If the evil continues it will be necessary for the retailers to combine together, and unitedly withhold their trade from such houses. The trade must be protected from the serious injury they are doing it. H. STEINMETZ.

Raleigh, N. C.

"Inofohibo Cmfwypcmfwypppuu."

In describing an ovation given an opera company a New York daily perpetrates the following:

Flowers! Well, rather. It rained roses, tielbw carnations, it showered lilies, and something iu the nature of a violet cyclone struck the stage. At the end of this memorable performance the stock of every florist's stand iuofohibo cmfwypcmfwyppuu.

The cause of the extremely dull season is at last made plain to us. No wonder times are hard with the florist when his stand is "inofohibo cmfwypcmfwypppuu."

LENOX, MASS.—The Lenox Horticultural Society has met with much encouragement since its organization and the membership is increasing rapidly. The headquarters of the Society will be at Sedgwick Hall. During the remodeling of this building their temporary home is at the Town Hall, where meetings are held regularly on the second and fourth Saturday of each month. Mr. Norman gave a lecture on orchids at the May 19th meeting which was very interesting. A horticultural exhibition is planned for the latter part of September.

MOBILE, ALA.—The Mobile Chrysanthemum Club has issued a premium list for its first annual chrysanthemum show to be held in this city Nov. 22 to 24 next. Copies may be had on application to the secretary, Miss Mollie Irwin, Mobile, Ala.

Seasonable Notes.

The majority of chrysanthemum growers are now making preparations and laying plans for the fall shows and trade, with visions of $50 prizes dancing before their eyes, although the older exhibitors made their first move some time ago, those intending to show plants during the winter and the growers of cut blooms during the early spring. For the last few years many writers and good authorities have told us that May was plenty early enough to propagate our plants, and so it is for commercial flowers, for the plants are much easier cared for, but our experience has been that April struck cuttings, if well grown, give a far better bloom and a flower that will stand for two or three days when placed on exhibition and look nearly as fresh as when first staged, while those grown on later struck cuttings, especially those propagated late in June, while fully as large and of nearly as good depth, will wilt and look like so many discolored rags the second day of the show.

But, of course, if the plants are not yet propagated, they must be, and it is early enough to strike cuttings that will produce a very good grade of blooms. Propagating during the latter part of May and June is very easily done, although with varying success by many. The stock plants should be well watered and cared for and never allowed to run dry, so that they will supply good succulent cuttings and not hard, wiry wood. Our plan has been in making the cuttings to remove all the lower foliage, so that when inserted in the bench the leaves will stand clear of the sand and not lay upon it to cause damp. After the cuttings are placed in the bench give them a good watering; by this we mean to syringe water on to them (using a watering pot with rose attached) until the water stands on top of the sand, and from that time on until they are rooted keep the sand well saturated. If the bench is located where the sun shines on it during the day, shade quite heavily; we have always placed hotbed shutters on the outside of the house, but at any rate don't let the full glare of the sun shine on the cuttings for the first three or four days, or they will wilt, and if that happens it will take the cuttings a week or ten days longer to root and a great many may be lost.

How is the compost heap? Is it all ready to place in the benches? If it is too rough and coarse turn it over once more and break the sods up a little. Have you put in any bone? Well, don't forget that bone is one of the best flower producing manures that we know. I see Messrs. Drover & Adams of Fareham, one of the most successful firms exhibiting in England, say a hundred pounds to a cart load, but that of course is very indefinite, for cart loads vary and few of us know anything about an English cart; but you can safely use 200 pounds to a cord, and if you want to come out near the top at the shows next fall put it in the compost and you won't rue the expense. Oh! someLody told you that a top dressing of flour of bone next summer was just as good. We fell into that lazy trap ourselves, but it wasn't "just as good," and we lost prizes thereby. It is a great deal better to work it into the soil and have the phosphoric acid all ready when the plants want it than to try and get it on at just the right time, for they know far better than you when they are ready to use it and you are very apt to put it off too late, for you want to go to the convention and are too busy. Besides, pure flour of bone is not always easily obtained and you can get a pure grade of ground bone at less expense, and if you get it well disseminated in the compost it is all ready when the plants want it.

ELIJAH A. WOOD.

West Newton, Mass.

Propagating House, Lilium Harrisii and Violets.

I have been requested to answer queries regarding the above, and although there are plenty of higher authorities I can give my personal experience, and hope that those who know better won't be slow to criticise.

From Macomb, Ill., comes the question how to build and heat a propagating house. During 25 years I have propagated plants in several different styles of houses and with nearly the same success, but the ideal house for me is 11 feet wide, running north and south; this aspect is preferable to east and west because it needs less shading. The benches can be 3 feet and 6 inches wide each and the path 2 feet 6 inches. The benches should be covered with strong roofing slates, not boards, and under them plenty of support, for slates decay with our continual application of heat and moisture. On the slates have the side boards high enough for 3 or 4 inches of sand. Under the benches should be three or four-inch hot-water pipes, and no pipes should be above the benches. In fact the heat should be confined so that none can escape into the house, but be entirely confined under the benches. On the front or path side of the benches one board the whole length

should be hinged either at top or bottom. When the temperature outside is very low you can open the hinged board and still have plenty of bottom heat. When the weather is mild little fire heat is needed but that little will keep the sand warm and the atmosphere cool with the movable board shut. You can keep the house just exactly as you want it, say the sand at 70° and the house at 50° or 55°. Almost all the plants that are grown by the florist will root and root well and make thrifty plants under such conditions. If you are a carnation grower in a large way this sort of propagating house is not necessary, and I have found by experience within a few years that an ordinary bench without any bottom heat is good enough, and cool both top and bottom. But I have rooted many thousand carnations under the first described conditions with the most perfect success. Keep the benches well away from the side walls so that there is no fear of drip. If you don't use 4-inch hot-water pipes, then 5 1¼-pipes will do as well. Hot water is much better than steam because on mild days you will drop the steam entirely.

From Columbia City, Ind., comes the query how to dispose of surplus rose leaves. If it is rose petals that are meant give them to some of your lady customers who know how to "pickle" them down. I have often had inquiries for them but very sorry that I had them.

The same subscriber wants to know "how you get 8 and 10 flowers of the Lilium Harrisii from a *small* bulb." I don't think you can. Good, sound bulbs from 7 to 9, and those from 9 to 11 inches, will easily give 8 to 10 flowers. This subject has been well written up and it will seem a monotonous repetition to repeat it. Briefly the bulbs should be potted in 6 or 7-inch pots as soon as received, and kept outside until 1st of December, or earlier if they are wanted earlier. No forcing should be given them until they are almost showing buds, but a temperature of 55° to 60° at night won't hurt, and that is high enough for any stage of their growth, but sometimes they have to get a little more than that because you want them in at a certain date. Lilies don't like fresh animal manure. A good turfy loam suits them best. If there is any plant that needs faithful and steady fumigating it is Lilium Harrisii and longiflorum. Somebody said last winter in your columns that the cause of the buds splitting was injury done by greenfly when the buds were very small, and he was perfectly right. When the buds are just forming deep down among the leaves, the greenfly, if allowed will get in his work, which no amount of care can afterwards remedy.

From the same source comes the inquiry "how to raise a few violets in a carnation house." From my experience and observation, those who are perfectly green at the business in all its branches have been the most successful violet growers in our locality. There is not the slightest reason why violets cannot be raised along with carnations. The latter will thrive and do well and be profitable if the thermometer does go down to 40° or 45° at night providing you have a good warm temperature in the daytime, and that will suit violets exactly. The carnations want the fine sunshine, all we get and more in the winter months, but the violets should have a little shade at all times, or except perhaps December and January.

WM. SCOTT.

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

Hardy Flowers for June.

With us at Trenton the June flowers are mostly flowering in May, at least the early June flowers are fully two weeks earlier this year. But it is exceptional. Generally the following list may be relied upon for a June display in the northern portions of the country.

SHRUBS AND SMALL TREES.

Amelanchier Asiatica,
Azalea Vaseyii,
Azalea Calendulacea and varieties,
Berberis Thunbergii, etc.,
Chionanthus virginicus, etc.,
Coronilla emerus,
Cytisus laburnum,
Cytisus nigricans,
Cladastris tinctoria,
Deutzias,
Halesia diptera,
Hypericum Andreanum,
Kalmias,
Leucothoe Catesbæi,
Loniceras,
Magnolia glauca,
Magnolia macrophylla, etc.,
Pæonia (tree),
Philadelphus in variety,
Syringa persica,
Syringa japonica, etc.,
Spiræas,
Robinias,
Rhus,
Roses,
Rhododendrons,
Tamarix Dahurica, (We have a specimen of this at Mrs. Gen. Perrine's, 25 to 30 feet high and some six inches or more in diameter of trunk),
Wistaria frutescens,
Wistaria multijuga,
Wiegelias.

HERBACEOUS PLANTS.

Aconitum napellus,
Aquilegia chrysantha,
Amarylla atamasco,
Armeria vulgaris,
Campanulas,
Centaurea calocephala,
Clematis recta,
Digitalis purpurea,
Dictamnus,
Epilobium,
Funkia Sieboldii,
Helenium grandiflorum,
Iris,
Monardas,
Œnotheras,
Papaver orientale varieties,
Phlox suffruticosa varieties,
Pyrethrums,
Ranunculus fl. pl.,
Spiræa lobata, etc.,
Silene pennsylvanica, etc.,
Saponaria ocymoides,
Trollius europæus,
Tradescantias,
Viola cornuta,
And others.

I enclose a sketch showing how a selection of these may be grouped in front of a building or any desired situation. A mass of one species is commonly most effective in a bed.

JAMES MACPHERSON.

Trenton, N. J.

A Model Retail Establishment.

The oldest and most famous cut flower store in Philadelphia, and one of the largest in the country, is that of Pennock Bros. at 1514 Chestnut street.

The business was established in 1862 by Messrs. A. L. Pennock & Brother, who were then growing and selling trees and general nursery stock. They built two small greenhouses and engaged Thomas Cartledge to manage the new department. For two years the plants grown were sold in the market house then at 16th and Market streets. In 1864 a greenhouse and office was built at 10 South 12th street, below Market, and the business there established has since grown to such an extent that the firm of Pennock Brothers is known all over the country. As the business grew, Thos. Cartledge and John Westcott, who had in the meantime become connected with the establishment, were taken in as partners and given a half interest. Later on Mr. A. L. Pennock, his brother having retired, gave his son Herbert, who had charge of the books, half of his interest, and so the firm remained until two years ago, when Mr. Westcott and Herbert Pennock retired.

In 1874 the property now occupied was purchased and improved, and in the summer of '75 the Twelfth street store was vacated and everything moved to the new establishment. The amount of business transacted in the old place was really wonderful. There were some fifteen hands employed steadily during the winter season and oftentimes more. Seven-thirty sharp, was the time to open up in the morning, but it was any time after nine p. m. up to twelve, before the place was closed. Some were kept constantly engaged making up funeral designs, there always being orders of this kind on hand, and frequently work was refused on account of lack of time and their inability to get flowers. Fancy such a state of affairs at this day! Some did nothing else all day long but make pyramid bunches, the pyramid being then the prevailing style of design for table ornament for large occasions. The bunch was made on a thin stick 12 to 15 inches long, with a camellia in the centre, backed up by bouquet green, and around this would be one row of flowers consisting of bouvardia, leaves of poinsettia flowers, arbutilons with the petals reflexed, sweet alyssum, fuchsias, carnations, nasturtiums, in fact almost anything was thought good enough for these bunches, which were then arranged in a wire pyramid and placed on top of a tall, fancy colored vase in the centre of the table, which were afterward distributed among the guests. Around the bottom of the frame, reaching nearly to the cloth, were large fern leaves of Pteris tremula or T. argyrea. Sometimes, if it was to be unusually elaborate, several gypsy baskets filled with small flowers, and, occasionally, a couple of wreaths were hung out about 6 inches from the body of the design, which by the way was always topped off with a large pyramid shaped bunch, the inevitable calla lily in the top. We have seen the florist stand off and gaze with a look of admiration at his handiwork and have heard the lady of the house exclaim, "Oh! isn't it just too lovely for anything!" What would our lady of the house say to-day if such an arrangement was placed on her table!

In speaking of the business at that time during a recent conversation, Mr. Cartledge said: "Our house back of the office or store was filled with camellias, which was then the principal flower. I don't remember that we had a single palm on the place. It must have have been well up to the seventies before we kept any palms. The first we handled were latanias and were quite expensive. We did not think of doing decorating then, it was all cut flower work, and a few bedding plants in the spring. As for Easter there was no attempt made to grow blooming plants, and the small extra trade was confined to cut flowers entirely. By and bye, as the trade grew, there came a demand for

INTERIOR VIEW OF THE STORE OF PENNOCK BROS., PHILADELPHIA, AT EASTER.

callas and for quite a while they were *the* Easter flower. Lilium candidum was also grown later on quite extensively."

"When did Lilium longiflorum become a commercial flower?"

"I think we got the first blooms from Gus Messeburg in Flatbush in '72 or '73. I remember they sold readily at $1 each. We had to import most of the roses we used at first, as there were very few grown in this city until '76, in fact it was 1880 before we could depend on the growers about here for any quantity. Now it is not a question of getting stock enough but we nearly always have to be on guard for fear of being overstocked. The custom of sending plants and cut flowers as personal gifts at Easter has grown up in the last twelve or fifteen years, the demand previous to that time being entirely for Churches and Sunday Schools. The Easter trade of the present day has increased to such an extent as to tax the most perfect system of management at this busiest of all seasons."

"How do you manage to make room for the extra stock at this time?"

"Well we have to manage the best we can. We put a wide shelf up next the walls of the greenhouse and pack the palms closely together. These make a good background for the blooming plants. Some of the hardier kinds we stow away in our capacious cellar, 20x130 feet, and it is a very valuable part of our establishment at times like these. We also arrange blooming plants in the front of the store and wherever we can find a place to set them. In ordering our Easter stock we arrange with the growers so as to have a portion come in each day. Some plants will keep nicely for a week but others, notably hydrangeas, and particularly genistas, want to be sold at once. Hydrangeas, if well grown and cared for, will last fairly well, but for an early Easter they have to be forced so hard that they are generally very soft, and of late years the flowers seem to fall very quickly. But the genista, no matter how well it is grown, will lose color and close up its flowers the second day. It is a pity too, for it is one of the most salable plants when well grown.

"I have often looked at our stock when we had every available inch of room filled up and thought of the wagon loads of plants still to come, and then of the cut flower department and the work to be done there, and wondered how we would ever be able to handle and deliver everything satisfactorily and on time, but we generally manage to get through all right. The only wonder to me is that there are not more mistakes, as we have to employ a lot of extra helpers, many of them with little or no knowledge of the business. We divide our force up, some going to the cellar to make up designs and put up orders, others to sell plants, which as fast as sold are packed in baskets, all orders being sent out in this way, and then there is no danger of getting the lots mixed up. We always pick out the advance orders a day or two ahead and set them away, and then our salesmen are directed to try to get the people who buy in the early part of the week to have their purchases sent at once and not kept until Saturday as used to be the custom.

"Whenever possible we tie all the lily flowers up with slips of tissue paper, as they are so apt to be damaged in delivering. We find of late years a large increase in the demand for cut lilies and we recommend the cut blooms in preference to plants whenever we can. They are so much easier to handle, both for the growers and ourselves. As a rule cut lilies give just as much satisfaction as they do on the plants. I should certainly recommend florists to talk cut lilies at Easter.

"We had one counter this season on which was kept a stock of flowers that people could select from and carry away. No orders were taken here, such customers being sent to another counter. We found this plan to work well and it did not take skilled help to manage it."

"Do you like your new refrigerator?"

"Yes, very much. We used to keep our flowers in the vault under the pavement but of late years the sewer and illuminating gas has managed to get in in spite of all we could do, and we had to abandon

it. This shows off the flowers to advantage and we have the stock right here at hand. It is 15 feet long, 3 feet 6 inches deep. I wish it was 4 feet. It is 7 feet high in the clear and room above this on top for more than a ton of ice. There are three compartments divided with glass partitions that you can scarcely see, yet in sliding the glass doors in one compartment the cold air from the others cannot escape. It uses about a ton of ice a week and keeps the temperature from 40° to 50° according to the frequency with which the doors are opened. I don't see how anyone can get along without something of this kind now, as people expect more than they used to, and one must keep up with the times. The electric light which we can turn off and on with this switch lights up the flowers nicely and is a great addition, and best of all we find that most all stock keeps better here than anywhere we have ever had it. Everything is put in jars or vases of water. It shows to so much better advantage and keeps just as well or better than when laid in boxes or trays."

The accompanying views of the store and show house were taken last Easter. The store is 20x60 and the greenhouse in rear, separated by glass partition, has about the same dimensions, with an additional house on top of stable in rear, about 30x20. The top of the refrigerator can be seen in the rear on the left of the picture.

Chicago Parks.

WASHINGTON PARK.

The effects of the severe storm and low temperature of the latter half of last week has been less ruinous than was at first feared. As no actual frost occurred as far as reported the damage done was caused by the high winds. At the same time the sudden check of a luxurious growth has naturally had a decidedly damaging effect on all outdoor vegetation. However a few weeks of pleasant weather will probably repair all damage so far as trees and shrubs are concerned.

After cessation of work for a week bedding is pushed forward with redoubled energy. This work had not progressed very far previous to the storm. A number of beds of geraniums and verbenas were out, but these, aside from having their bloom whipped off, appear little the worse for tough usage. The large globe formed of echevarias and oxalis, which is familiar to all visitors to the park, had been placed in position. The elevation on which it rests had the full benefit of the gale and it's a wonder the thing wasn't blown to pieces, yet not a single plant was displaced, although the echevarias on the north and east exposure have a shriveled appearance at the edges of the leaves. The vases or urns surrounding the globe were also out. These, by the way, are arranged very tastefully with the same material as that employed in the globe. From an æsthetic standpoint we may find little to admire in arrangements of this kind, but there is no doubt that it pleases the multitude, and this is a consideration that should never be lost sight of. Our public parks are supported by public taxes, and their full share of the burden is borne by the people whose tastes are not educated up to the point of appreciating the beauties of landscape architecture that appeal to the cultured few. In view of the fact that these features of park ornamentation which are often called "monstrosities" have proved a great attraction to thousands of visitors, Mr. F. Kanst, who so ably manages the affairs of the south parks, has always devoted more or less space to such arrangements, although personally opposed to the practice. But isn't it time to gradually draw away from the old line and strike into the new channel, more in harmony with advanced ideas? In our desire to please we shouldn't lose sight of the fact that the higher mission of our public parks is that of an educator. However, if it jars on our nerves to look at a gates ajar of plants we can turn away and find plenty to admire where the most fastidious taste will not be offended.

The greenhouses, hotbeds and coldframes are filled to their utmost capacity. The number of plants required for planting these spacious parks and boulevards is enormous, and to handle the vast amount of material is no small job; yet in a week or ten days we will find everything in shape.

The present conservatory is altogether inadequate for the needs of the park. Many of the palms have outgrown the room allotted to them. There isn't half room enough to properly arrange or take care of a host of valuable plants which are crowded together now for want of room. There is however a good prospect for better facilities in the near future.

JACKSON PARK.

Jackson Park is now under the management of the South Park board again and plans for its improvement are now maturing, though at present the wooded island, of World's Fair memory, is the only spot that is receiving any attention.

Our visitors last summer (and for that matter we don't exclude our local talent either) may not have been particularly impressed with the grandeur and triumph of horticulture at the Exhibition, but the little island was one of its redeeming features. It is a pity this couldn't have been created a year earlier. As seen this spring it is really a beautiful place. We are pleased to learn from Mr. Kanst that very few changes are contemplated. Most of the beds which contained exhibits are turfed over and a number of walks will be treated the same way later on.

The storms of last week did considerable damage to the borders skirting the lagoons. The high winds from the northeast drove the water from the lake into the lagoons, raising them fully 3 feet above their normal level, and many of the shrubs and plants were washed out. Owing to the location of the surrounding buildings, the northwest end caught the full fury of the storm and many of the trees are almost entirely denuded of foliage. In other parts the damage is trifling.

The Ellwanger and Barry collection of ornamental trees and shrubs is nearly intact and with the exception of box, which was winter killed, is in much finer shape than last year. Fully one-half of the large beds containing Hydrangea p. grandiflora are still here and promise a grand show this summer. The borders are gay with a variety of hardy perennials, notably aquilegias, iris, gems, pyrethrums, phloxes in variety, and many other early forms.

The rose garden, for the present at least, will remain practically as originally laid out. Mr. Luetschg, who had charge of the island last year, is back again at his old post under the present management. The rose garden has always been Mr. Luetschg's particular pet. Some of our last year's visitors may remember the sulphurous state of the atmosphere surrounding the same rose garden when the water supply ran short at the height of the dry season. However, his temper will not be tried again this year, as ample provisions will be made to avoid a recurrence of last year's experience.

The roses, by the way, are looking very fine this spring. Most all of the different sorts came through the winter in good shape. Even such tender teas as Safrano, Bon Silene, Perle des Jardins, Gloire de Dijon and others. One bed of Mrs. John Laing and another of Marshall P. Wilder came through in fine shape without the least covering. Among others we note the following that look the most promising: Jules Margottin, Gen. Jacqueminot, Paul Neyron, La Reine, Baroness Rothschild, Merveille de Lyon, etc. Of all the varieties grown here Hermosa is the only sort which is almost completely killed out.

The border of hardy perennials which surrounds the rose beds looks better than last year. But very little is in bloom yet.

Several beds of Azalea mollis are in fine bloom. Those azaleas have wintered remarkably well and appear very thrifty. Rhododendrons too (having been carried through the winter in cold sheds) look quite well and are covered with buds promising a fine show. Some of the poorest specimens, thought not worth the saving, were left out all winter without any protection whatever, and all are alive and growing.

In the Japanese garden at the north end we also noticed some Azalea Indica which were left in the ground all winter. These plants, with few exceptions, are alive and making growth.

Fern Notes.

GYMNOGRAMME.

It seems unfortunate that most of the members of this genus are not such as may be classed among trade ferns, their fronds being too soft to bear much exposure to the dry atmosphere of a dwelling. This characteristic naturally rules them out from among the available stock for filling fern pans, though some of the hardest fronds can be used cut for certain purposes with good effect, and will probably last fully as long as some other material that is used for this purpose.

The majority of the gymnogrammes are not difficult to raise from spores, and are also quite rapid growers, but require shading at all times except possibly during a month or two in the depth of winter, when such strong growing kinds as G. decomposita and G. tartarea will suffer little from full exposure.

The golden and silver ferns, so-called, are among the most distinct and beautiful varieties in cultivation, and make admirable exhibition specimens, among the finest for this purpose being G. chrysophylla Laucheana, this producing large and finely divided fronds of graceful outline, the crown of the plant and also the under sides of the fronds being thickly covered with bright yellow farinose powder, and this becoming scattered over the upper sides of the leaves also gives the entire plant a golden appearance.

Another lovely variety in the golden section is G. Parsonsii, this being a crested form of G. chrysophylla, also very much covered with the farinose powder, while the tasseled tips of the fronds weigh them down in a very graceful manner.

Perhaps the commonest species among the golden ferns is G. decomposita, the fronds of which attain a length of two to three feet, the footstalks being nearly upright and the leaves finely cut and arching in habit.

G. decomposita is not quite so golden as the preceding varieties, but still is dis-

THE EASTER DISPLAY IN THE SHOW HOUSE IN REAR OF THE STORE OF PENNOCK BROS., PHILADELPHIA.

tinctly covered with the powder on the under side of the fronds, and being a rapid grower it soon develops into a handsome specimen.

Decidedly the finest of the silver leaved section of gymnogramme is G. Peruviana argyrophylla, this being of compact growth and very graceful habit, the fronds finely divided and completely dusted over with white powder like frosted silver. This variety is best suited in a warm house, and with enough shading on the glass at all times to break the full force of the sun, and in common with all the members of this genus is not partial to watering overhead, the variety in question being especially averse to such treatment.

G. tartarea is a more hardy variety of the silver leaved type, and produces strong fronds of nearly upright habit, dark green on the upper side and covered with white powder beneath. G. tartarea may be compared in habit and hardiness with G. decomposita, and like that species may be well grown in a temperature of 55° to 60°.

Another remarkably beautiful crested variety is G. Wettenhalliana, though this is also a rather tender one, requiring warm house treatment in order to grow freely, and also strongly objects to watering over the foliage. In coloring the fronds of G. Wettenhalliana seem to be intermediate between the golden and silver leaved kinds, the farinose powder on its fronds being of a sulphur color, and is especially noticeable on the under side of the fronds, the latter being long and graceful and the tips much cut and tasseled.

G. sulphurea is another moderately strong growing species, and of compact habit, the under side of the fronds being powdered with light yellow of the shade indicated by the specific name. G. sulphurea is also most happy in a warm house, and though long introduced is by no means common in the average fern collection.

G. schizophylla is one of the most distinct members of the family, and when well grown is also one of the most beautiful. As indicated by the name, the fronds of this species are finely cut, in fact so much so as to have quite a feathery appearance, and are displayed to advantage when the plant is grown in a basket. Another peculiarity of G. schizophylla is found in the fronds being proliferous, young plants being frequently procured from the tips, but the farinose powder to which reference has so frequently been made in describing other species and varieties is not so plentiful in this instance, and is seldom noticed except in the crown of this plant.

G. triangularis is probably the most dwarf and hardiest of this genus, being a native of Washington and Vancouver, and throws up small green fronds of triangular outline, the under side being freely powdered with yellow, the whole plant being seldom more than six to eight inches in height. W. H. TAPLIN.

A Judgment on Judges.

The little tilt between Mr. Ewing and Mr. Stewart in recent issues of the AMERICAN FLORIST becomes interesting as these two doughty champions of opposing ideas warm up. The gallant Canadian did not quite like the sly thrust of the blue-blooded Yankee when the latter hinted that perhaps it was because of living under a monarchy that made a man think the one-judge system the best. Our monarchist was evidently too much in earnest to notice the twinkle of the eye which accompanied this little dig. But, for all that it was said in fun, this remark has considerable aptness in illustrating the different standpoints of the different individuals. The American idea is that the average judgment of the whole people is the only true guide, and the Republic is built up on that foundation. To an American the three-judge system at once appeals as the correct thing, and anything that savors of one man power is abhorrent. A Canadian brought up under different conditions would hold just the opposite opinion. He says give me one good man and I would rather trust his judgment than any half dozen "duffers" you can bring along. So there you are.

"There is one person that is always more right than anybody, and that is everybody"—so says Tallyrand. Very good. But how about this: "The minority is always right," says Ibsen. Two chunks of wisdom which may serve the occasion—one for Boston, one for Canada, and yet if the minority is right how soon it will become a majority! And there you are again. Touch the right button and presto your minority is now a majority.

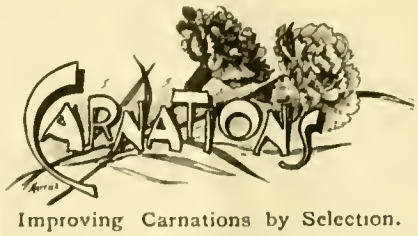
Let me tell a little story. This little story was imparted to me one summer evening 4 or 5 years ago by no less a person than Mr. David Bearn, the gentleman who has been at the head of the committee of arrangements of the Pennsylvania Horticultural society for the past ten years, and who knows more about the ins and outs and intricacies of judging than he always cares to tell. We were walking up to see the boys bowling at the Mannerchor and Davy being in a reminiscent mood got to talking of the first big show held in Philadelphia in the past decade. It was a great show, nothing like it had been attempted before either in Philadelphia, Boston or New York. Well, at such an aggregation the judges must be equal to the occasion of course. For the plants and other important exhibits they seemed the greatest experts then known in horticulture. They happened to be Peter Henderson, John N. May and John Thorpe. They got along in their work swimmingly until they came upon some entries for 6 foliage plants. How many entries is immaterial. They finally got down to two. Henderson and May said this one. Thorpe said no, the other, and then they trotted back to the other, and looked over them again. This was repeated so often that Davy began to think, "goodness, this Thorpe must be a wonder when he can make these two great lights defer in this way." Thorpe had not been much heard of in these parts at that time. To the outsider the Henderson and May lot certainly looked the best, but Thorpe proved his claim that they were not the best by finally turning them out of the pots and showing to his colleagues beyond a doubt that the plants had no roots and were not in health. And so ended the controversy, which was an eye-opener to at least one on-looker, and he has held a high opinion of John Thorpe's intimate knowledge of plants ever since. If on that occasion there had only been Peter Henderson present according to the Canadian idea, the wrong plants would certainly have got the prize. Of course this is only an instance, but it illustrates the point. Doubtless there are dozens of other cases that could be cited. The three-judge system certainly works well in Philadelphia, and we are all republican or democratic enough to believe that the system is founded on liberty and independence, equality and justice. G. C. WATSON.

Philadelphia, May 13, 1894.

We trust that further discussion will be strictly confined to the question of whether the one-judge or three-judge plan is the best, taking everything into consideration. The American principle as we understand it, is to secure the greatest good to the greatest number, and our Canadian friends are in perfect harmony with that principle.

There is much to be said in favor of either system, and to our mind the advantages of each depend largely upon circumstances. Mr. Watson's story can be used as an argument in favor of the one-judge plan with equal force. If Mr. Thorpe had been selected as the one judge he wouldn't have had to argue the matter with the other two gentlemen on the committee, and if they had been egotists instead of liberal minded men, they would have over ruled the judgment mentioned. As Mr. Watson says, "there you are again."

We believe all will admit that really good judges—men without prejudices, as well as thoroughly familiar with the plants or flowers to be judged—are scarce, and if it is difficult to secure one good judge, how much more difficult it is to find three. Three equally good judges ought to be better than one alone, as points might be observed by one that were overlooked by the others. But unless three first-class men are to be had, of what benefit is it to have that number? With one good judge and two doubtful ones there is a chance of the good man being outvoted. If two of them are first-class then the third one is simply a cipher and absolutely useless. But, if the judging must be done by men of doubtful capacity then three might be best, on the principle that you are more apt to catch a fish in a large net than a small one. However, no expense should be spared in securing the services of men of known capacity. And we agree with Mr. Ewing that the judgment of one such man is worth that of half a dozen others.



The One Judge Plan.

The Worcester County Horticultural Society has long used the "one judge system" and after 8 or 10 years experience with it the 3 or 5 judge plan has ceased to be talked about. The society has three judges of award, one for flowers, plants, etc., one for fruits, etc., and one for vegetables, etc.

The New England Agricultural Society, which has held its exhibitions in Worcester, Mass., for the last few years, has used the "one judge system" for four or five years with entire satisfaction.

I will not burden your columns with arguments. The one judge feels his responsibility and is always exceedingly careful in his work. If mistakes are made he has no colleagues upon whom he may shift the responsibility. F. A. BLAKE.

Rochdale, Mass.

Improving Carnations by Selection.

When a new carnation is introduced to the trade and this carnation has some good qualities, such as free blooming, good color and earliness, I would not condemn it on account of a few qualities that speak in its disfavor; for often they can be eradicated. For some years I have grown Mrs. Fisher, a very good carnation as far as it went. It was as white as the driven snow, a profuse bloomer, as early as any, and never a bit of rust have I seen on it during all the years I have grown it. All my neighboring florists despised it. What are you growing that thing for? they would ask generally. I told them I was growing it because I liked it, and if nobody wanted to buy it, I would grow a few more for my own amusement. I knew it had its drawbacks. It would produce its flowers in clusters, and the buds would be all near the top. The flowers were very large, so large in fact that they would most ridiculously burst the calyx and spill all the petals about. Nevertheless I planted a number in pots, and to my astonishment, when they came to flower the number of buds to the stem had greatly diminished, while those in the bench clustered the same as ever. Occasionally I would see one that would even keep the calyx closed and of course I would rob its stem at once of its cuttings. By persistent selection I have a carnation that has all the good qualities of the old Mrs. Fisher and none of the bad ones, except the stem, which is not quite as stiff as I wish it to be, but I intend to master that too. During a recent illness I had a friend come to see me. On a table were some of my favorite Mrs. Fisher and also some of Grace Wilder. Of course they attracted his attention. Looking first at the white ones he inquired: "Is that Silver Spray?" "No my friend," I replied, "that is nothing more or less than your much despised Mrs. Fisher." "Mrs. Fisher buds too much." "Don't condemn that innocent flower without trial. There is Grace Wilder, said to be a perfect carnation, now draw a flower off each, and then tell me which has the least number of buds on." He did so. Grace Wilder had three and Mrs. Fisher two, but there were quite a number of the latter that had none but the terminal flower. My friend struck sail and said he would try some more, when I would be able to go out again. Have others experimented in the same line? Let us hear of it.

Branford, Conn. CHARLES EVERDING.

Imperfect Von Sion.

We herewith present a portrait of a chap who is becoming entirely too common. His features are easily recognizable. If we could also produce the color it would be mainly green; here and there an occasional yellow petal that has managed with a hard struggle to stand out in its true color. Any one who has forced Von Sion of late years will have no difficulty in recognizing the rascal.

Is it any wonder that the grower, finding himself left with nothing to show for his good money and his months of care and attention excepting a lot of abortive useless rubbish, is inclined to give vent to his disappointment and anger in words more expressive than polite? For although he is in no manner responsible for the failure yet every one of those bulbs must be paid for, and in the present condition of the bulb forcing industry it does not take much of this waste to offset any possible profit.

As to the cause of the trouble; many experienced growers do not hesitate to assert that the defective bulbs are grown mainly in Italy, Southern France and to a lesser extent in England, and that genuine Holland grown bulbs are the only stock that can be depended upon to produce perfect blooms.

Whatever foundation there may be for this claim it is undoubtedly true that there is no varietal difference in the bulbs, but that the soil in which they are grown and their condition when harvested are at the bottom of the trouble, for Italian grown bulbs, if planted a season or two in Holland before exporting, come out all right.

It seems almost superfluous for us to caution our bulb forcers to be careful in their purchases of bulbs for the coming season and by all means to avoid buying Von Sion that are offered cheap or with-

IMPERFECT VON SION

out some assurance as to their origin, and it should be equally unnecessary for us to warn our foreign friends that there is a limit to even American patience, and that persisting in the reckless methods recently practiced they will very soon have no American market to worry about.

Narcissus Buds Blasting.

Please permit me to inquire of the readers of your valuable paper why my narcissus seem to blast or wither in the flower bud and not mature their flowers, while others growing alongside seem to do well. The above are growing outdoors. A.

The reason why narcissus come blind is considerable of a puzzle to gardeners. The matter has been pro'd and con'd in the horticultural press, especially in that of Great Britain, a good deal and many experts have had their say and aired their opinions, but the matter still remains about where it was. Narcissus poeticus seems to be the worst offender in this respect. A change of soil and location might produce good results. A rather deep and somewhat stiff soil suits the narcissus best and if somewhat shaded from the hot sun so much the better. W.

Foreign Notes.

The *Journal des Orchidees* for May contains a complete list of the species and varieties of cypripediums now in cultivation. The list covers seventeen pages, and 84 varieties of insigne alone are given.

At the sale of Mr. Geo. Hardy's orchid collection recently about $15,000 was realized for 520 lots. A superb plant of Cattleya Mossiæ Hardyana brought $825, C. Mendellii, Quorn House variety, $750, and a superb plant of Cattleya Skinneri alba, $750. The proceeds of the sale showed that fine specimen orchids are not losing ground by any means.

Philadelphia.

Such a week of wet weather has not been experienced for many months, if not years; it was rain all day, then all night, then again the next day, without any let up. It really seemed as if it never would stop. It cleared up Friday night, but rained again Saturday afternoon, so as to make a week of it. While the storm caused a great deal of inconvenience, that was almost the extent of the damage, except in a few instances. In the neighborhood of Bryn Mawr several establishments were damaged by hail, Henry G. Standen to the amount of $170, Mr. Campbell lost about $250, and James Kent at Ardmore, near by, lost from $300 to $500. There was no insurance on any of this glass. A number of private places in the vicinity also suffered to a considerable extent.

E. Metcalf of Norristown was reported in the daily press to have lost his entire establishment; this proved to be a much exaggerated report. His place was close to the Schuylkill river, which, overflowing its banks, did do him considerable damage, but only to the extent of $100. The statement, however, led his brother craftsmen to write letters of sympathy with him in his great loss, offering assistance in various ways. From these letters Mr. Metcalf found that his misfortune had touched the hearts of his business associates, and had he suffered to such an extent they were willing to help him bear his loss, and would do all in their power to get him on his feet again, all of which must have given him a greater faith in human nature.

With the trade in and about the city much inconvenience was caused by water in the stoke-holes, which made it impossible to keep the fires going. We have heard of a number of pumps purchased, which may not be needed again in a decade. Coming as it did right in the height of the bedding-out season it interfered greatly with this work, and had a very bad effect on the stock in the houses. Geranium flowers were transformed into a ball of mould, while the bottom leaves were also badly affected. Other flowers suffered in like manner, and the houses the latter part of the week looked anything but inviting. With cut flowers it was much the same, and the stock offered each morning by the growers presented a very forlorn appearance, but as it was all alike the dealer had to do the best he could with it. As business was also very bad, partly on account of the weather, and the natural decline, which seems to have set in very early this season, there was enough for all demands.

Prices are about the same as last week, but with a declining tendency. There are lots of pæonies about, and they seem to sell well at 75 cents to $1 a dozen. It's an ill wind that blows nobody good, and in the absence of sun to take the color out of Daybreak carnation it has been coming with an ideal color, which certainly adds to its selling qualities. Gardenias are now coming from the south, and bring $5 to $6 per hundred.

Messrs. Harris and Craig have had to postpone their sales in Boston and New York till next week, on account of the delay in movement of trains, owing to flooded tracks. The plants had all been packed in cars, but had to remain in the station, as it was impossible to move freight of any kind.

Messrs. Z. De Forest Ely & Co. have their window fixed up in a very attractive manner for Decoration Day. The seed men all report having had a very good counter and local business, but report the shipping and mail trade not at all up to the mark.

Mr. E. Towell, late with Edwin Lonsdale, has gone into business on his own account at Gwynedd. He is erecting two houses, which are to be devoted to carnations, mostly Grace Battles, H. Keller, and other choice varieties. He will also act as foreman for Mr. Redfield of same place. K.

Mr. John Westcott looks rosy and happy and says he likes the growing business immensely. He does a large wholesale business in bedding plants. English ivies, Ampelopsis Veitchi, and honeysuckles are three of his specialties, and he handles more of these probably than any other establishment in this neighborhood. He has also a house of palms in fine condition and another of crotons which for quality and variety would be hard to match. His new geranium is now in fine shape and is worth going a long way to see. He has not decided on a name for it yet, but thinks of calling it the "Laurel Hill." It's a beauty. The electric cars on Ridge avenue now run past Mr. Westcott's place. One can now get there quickly for one fare without changing. It is a great convenience for visitors but may tax John's patience a little by bringing too many, for all know his hospitable nature

and like to drop in on him. The latch string is always out at Laurel Hill.

The old Cursham place at Greenmount cemetery is now owned and occupied by Mr. Edward I. O'Neil, who is working energetically to get the establishment and the stock into proper shape for doing the big trade that this fine location warrants. He is ably seconded in his labors by his foreman, Mr. Robert Lockerbie, a young man well known in this city from his having been so long at Robert Craig's place. Bedding plants for spring sales is the mainstay, but some Easter stock will be grown also. One large house (150 feet) is now being planted with roses. Another one, 100 feet will be filled with carnations. The other three houses will be used for miscellaneous stock.

Mr. Harry Waterer, with Mrs. Waterer and family, leave for Europe June 2.

Mr. Chas. D. Ball keeps cheerful on the palm business outlook. He says he has done more than ever before the past year and has not felt the depression except in somewhat lower prices. He will drop lilies and other "flying" crops this coming season and devote more space to palms.

Dennison Bros. say the bedding plant business is poor up to this date (middle of May) there being fewer buyers and lower prices. A couple of weeks of good trade (which is likely) will change that tired feeling.

Mr. Edwin Lonsdale, as president of the Florists' Club, has his hands full just now with steering the crowd in the direction of the convention at Atlantic City. His bewitching smile is getting broader than ever, especially when he wants to put one upon some of his endless committees or sub-committees. He has also a grin of an even more ecstatic hue when anyone mentions "Helen Keller," and one peculiar thing about that is that everybody seems to be glad that he struck it good. Success generally excites lots of envy and other disagreeable features, but the "Duke" seems to have the happy faculty of finding "an entrance out" of all such troubles.

Mr. David Bearn is always cautious about endorsing a novelty and was never known to get enthusiastic or to give anybody a testimonial. He is now scratching his old head and wondering what the "Helen Keller man" will do next. Mr. Bearn's carnations have done much better than he expected. The outlook early in the season was anything but bright. Roses have been better than previous season, but then—there's *the prices* this year. Beauties, what few he had, did well and more space will be devoted to them next year.

John Haubert keeps jolly as ever, and has nothing to complain about. He says his Easter trade at the store he hired on Ridge avenue was away beyond his expectations.

Geo. Anderson keeps struggling and wrestling with the question—why will these fellows cut prices? And why don't the store men's customers get the benefit of a cut when a cut is made? And how in thunder do these fellows that cut manage to pay their bills? It is a good thing for the trade that there are one or two old standbys like George, who send in good stuff and stiffen the backbone of the market. Anybody can cut prices but it takes a mighty smart fellow to put them up a notch. This price question and the problem of who of the horde of aspiring applicants are to be the Philadelphia team in the bowling contest at Atlantic City, are two interesting and difficult subjects that keep George on the ruminating bench, and the latter promises to develop for him a halcyon and vociferous time before all hands are convinced that the selections are just right.

The fame of our alert and rising young genius on 12th street (H. H. Battles) has reached the confines of New York. He had an important commission there this week. If it wasn't for the rush of business here in this driving town our florists might have time to attend to the New York trade a little better. The New York public have our full sympathy under these distressing circumstances; but these little outlying villages cannot expect everything.

Mr. Geo. E. Fancourt, of Wilkesbarre, was a recent visitor in Philadelphia. He seems to be making a go of the rose growing and says he will take a trip across the water next month. That is one evidence of prosperity certainly. But we can't all have cheap coal. W.

St. Louis.

The cold snap and late frost as noted in last week's notes was more extended, and of greater intensity than appeared at that time. The severe northwest wind accompanying the cold seems to have aggravated the effects. The damage done gardeners was heavy, early tomatoes, melons and other garden crops being severely pinched, and in some cases killed outright. About the time the gardeners were becoming reconciled to the frost's visit, those in the southern part of the city were called upon to bear another visitation of providence in the shape of a hail storm. While nothing like as severe as the one visiting the same locality last season, the lateness of its appearance caused it to do as much damage, a great quantity of plants being so bruised and cut to pieces as to be worthless. Loss fell also upon the florists having stock outside in this section.

Stock has been scarce, and of very inferior quality. All rose growers seem to be affected with bad cases of mildew, and stock is unsightly as a consequence. Sweet peas have been in most demand, and have been in short supply, selling at $1.00 per 100. Trade has been rather quiet, nothing much being expected until school commencements begin.

In visiting South St. Louis a call was made at Mr. Fillmore's, and the genial Frank found as full of jokes as ever. His three-quarter span rose house that has been in carnations all winter is still looking fine and throwing good flowers, particularly of Albertini, Daybreak and McGowan. Frank finds McGowan the best white, although some Silver Spray are grown. He expects by proper attention and care to keep the plants going during the summer, and to cut good flowers almost up to the time to replant. Mr. Fillmore is noted as a lover of new varieties of plants, and the novelties are given a trial by him as soon as possible. Among the fuchsias tried in the past several years he has been most impressed with one called Little Beauty. Its chief merit lies in its dwarf growth and profusion of bloom, which sells it on sight. Trade has proved much better with him than the first part of the season promised; he estimates the falling off by the time the season closes at about 10%.

Mr. Schray, in the same vicinity, was also called upon and everything found as neat as usual. Several fine batches of Pandanus utilis, hydrangeas and fuchsias were noted, as well as one house devoted to flowering begonias, which was a beautiful display. Carnations were found in good shape. Among reds he finds Sentinel the best and will increase its planting. Mr. Schray has practised for the last few years the planting of his small carnations in the benches where they are to stand during the winter, and is so well satisfied with the results that nothing could tempt him to change to the old method of field planting and lifting. It is understood, however, that the sash are taken from the houses and the plants are virtually outside.

A fine lot of petunias were noted, both double and single, raised from home grown seed; the fertilizing was carried on under glass and the resulting crop was exceptionally good, both in perceatage of double flowers and in markings. Some roses in 4-inch pots, intended for the planting of their rose house, were in fine shape and doubtless will be heard from during the chrysanthemum show.

The hail which visited this section broke about 200 lights for Mr. Schray and about 50 for Mr. Fillmore.

The fifth series of games between the teams composing the Bowling Club, has come to an end and both the "highest individual," and the "highest average" medals go to Mr. Kuehn, who takes the former with the low score of 242, and the latter with the creditable average of 204 for the twelve games. The next best averages are Jules Benecke with 177, and Arthur Ellison with 173, for twelve games each. Good scores were made by the following members: Jules Benecke, 225; John Young, 232; Will Young, 222; C. Roper, 214, Lawson and Emil Schray, 204 each; Arthur Ellison, 201.

At the meeting held on the 26th it was decided, in view of the fact that the poorer bowlers had no show for the medals, to institute a system of handicaps which would allow so many pins to a member for each game played, and thus give him some encouragement; so handicaps were allowed of from 5 to 40 pins, according to the member's ability as ascertained from the averages in the last five series. The teams were also rearranged, and with the handicaps allowed the contests promise to be lively. R. F. T.

New York.

Decoration Day demands, a full week of cold stormy weather, and the effect of the replanting of houses now going on have made roses quite scarce, and there is no lack of customers for every rose that comes in, although prices do not run over two and three dollars per hundred for average stock. The main supply at the 34th street market now-a-days consists of outdoor stock such as snow-balls, pæonies, irises, etc., and the cheaper grades of indoor stock. There is a fair demand for all just at present. Some very fine lilacs from up North are coming in and bring almost winter figures. Carnations are getting small. They run from 75 cents to $1.25 as quoted in advance for Decoration Day.

Indications of summer stillness begin to crop out in the wholesalers' quarters. The morning's trade is quickly disposed of and with the exception of those unfortunates whose job it is to fill out the consignment slips as satisfactorily as possible, there is little left for anyone to do during the balance of the day, and one can almost hear the euchre deck rustling and the checkers jumping round in the box where they have been stored all winter, impatient to get started at their summer frolic. But before the dead season is due there ought to be a lively session in June and all are longing for an old fashioned

spell of weddings and commencement gaiety.

Herman Rolker has established himself at 218 Fulton street, where he expects to build up a business in specialties. Francis' new stemming device and barbed glazing points are his leaders now and other meritorious articles will be added later on.

The auction sales lack much of the snap of former seasons and prices are obtained with difficulty, fancy greenhouse stock suffering especially. "Postponed on account of the floods in Philadelphia" was the somewhat lamentable outcome of the promised sale of palms, etc., on May 24, from the celebrated Philadelphia growers, but the flood subsided and the great event finally came off on May 31.

Frank Traendly and Charlie Schenck have started in the wholesale flower business as Traendly & Schenck, with headquarters for the present at 910 Broadway. Charlie has been for a long time in the employ of J. K. Allen.

The florists at Yonkers are looking for protection from the itinerant flower and plant venders from New York, and have petitioned the common council to raise the license fee of dealers from out of town.

W. H. Siebrecht of Astoria and Chas. Schwake of New York sailed for France on Saturday, 26th inst. Willie had a good time saying good-bye at the Market.

Strangers in town: J. C. Vaughan, Chicago, and J. W. Elliott of Pittsburgh, Pa. Mr. Elliott has been attending to landscape work at Narragansett Pier, R. I.

Chicago.

At the last meeting of the Florist Club the matter of a meeting place for the future was well thrashed out. The trustees were finally empowered to make a selection from among the trade places who had offered quarters free. It was also decided that at the next meeting, which will be held in the new quarters, there should be a good old fashioned supper with corn-cob pipe accompaniment. It was also decided that several members of the club be invited to come prepared to speak at the supper, and it is probable that the matter of park management will receive some pretty vigorous discussion.

Supt. Pettigrew of Lincoln Park has been asked to send in his resignation, but acting upon the advice of his friends he will not resign and will force the board to go upon record as removing him if they care to go to that extreme.

Mr. Altgeld has at last done one sensible thing. He has appointed Mr. Edw. G. Uihlein one of the commissioners of the West Park Board. Mr. Uihlein is a well known citizen, and furthermore is thoroughly conversant with horticultural matters. He is one of the vice-presidents of the Horticultural Society of Chicago. We are glad to at last be able to congratulate Gov. Altgeld on one of his actions.

The sudden scarcity of stock last week led to a sharp advance in prices, affecting every line, and roses and carnations in particular. The weather remaining cold after the great change of the week previous was undoubtedly the main cause of the shortage, although partly owing, also, to the fact that a good many houses are being pulled up and replanted with young stock.

Much of the rose stock sent in now is badly mildewed and almost worthless, and for this reason a number of houses have been thrown out, which it was intended to have kept running through June if they had been in condition. The grower, however, who didn't neglect his houses and kept the fires up, is in clover. The retail boys on the other hand are not particularly elated at the state of affairs. While the wholesale price of flowers has doubled in nearly every class, business with them remains as dull as ever.

Decoration Day, which will have come and gone before these notes will go to press, is not looked forward to with any great expectation by our city dealers. The extra demand, if there be any, is mostly for the cheaper grade of flowers, with little profit to the dealer. Stock, however, of such outdoor varieties as are generally to be had at this season of the year in great profusion are either already gone out of bloom, such as lilac, tulips, narcissus, etc., or else much damaged by the storm, as snow-balls and spiræas.

Pæonies and irises are about the only outdoor flowers to be had, excepting gardenias, which are received in great quantity from the south. These flowers, ordinarily a great drug in the market, are at present, owing to scarcity in white, in quite a lively demand.

Pæonies have taken a sudden jump from 25 to 35 cents per dozen to 75 cents to $1. The quality is only fair to medium, received as yet mostly from outside points, excepting "old reds." The bulk of our home grown stock will be in in about a week.

Regular Decoration Day prices went into effect as quoted elsewhere on May 27, although the market ruled firm at nearly the same figures the latter part of last week.

The blue corn flower has made its appearance and sells readily at 50 cents a 100.

T. J. Corbrey has returned from his California trip.

Recent visitors: H. C. Neubrand, representing F. R. Pierson Co.; A. Dimmock, representing F. Sander & Co.; J. S. Taplin, representing C. H. Joosten; J. A. Evans, of Quaker City Machine Co.; Rev. W. T. Hutchins, Indian Orchard, Mass.

Toronto.

We have had "some showers" (as Old Probs put it) here lately. One shower lasted nearly a hundred hours, which was of longer duration than any which have been before recorded since Canada was a country. Needless to say that the ground is a little wet and that outdoor operations are almost at a standstill. The weather is still very unsettled and lesser showers keep putting in an appearance. One of the papers remarked that it was not often one had the chance of "four days of solid liquid enjoyment" free of cost.

I send you herewith some of the most interesting points of the lecture given by Professor Panton to our association a week or two ago. The professor has also sent me some further hints by letter which may be of service. "Fungoid pests of the carnation have been very successfully treated by spraying the plants with one-half ounce sulphide potassium in a gallon of water; spray weekly. For one form of blight, the true rust, known by plump, gray blisters upon the leaves, no specific remedy is yet found. If a plant is badly affected with this there is little hope of curing it. All diseased parts should be removed and *burned*, and in bad cases the whole plant. Healthy plants may be kept so by spraying with some of the copper salts; this prevents the germination of the spores. Some one might try a solution of copper carbonate, three ounces of copper carbonate dissolved in ammonia; it will likely take about two pints, and add 25 gallons of water. Whatever quantity is required will be based on this proportion. If too strong add more water. Violet rust is only overcome by careful handling and changing the location of the plants. As far as possible destroy affected plants. Some one might try sulphide of potassium as for carnations. Free use of salt is a remedy against the minute worms (nematodes) in the soil. These sometimes injure violets very much. Rotation of crop must be also followed. In all fungoid diseases *destroy by fire all affected material as far as possible*, for it is full of spores. Try spraying with copper salts or sulphide of potassium to prevent spore germination." Professor Panton has promised to give us a lecture on "The flower and its use" shortly.

Last Saturday the market was fairly jammed with plants in flower and out of flower, herbaceous and annual. The demand was good, but prices ruled low.

The Agricultural Department of Ontario has started a most excellent arrangement at the Agricultural College, Guelph, whereby teachers of public schools can spend their summer vacation there for merely the cost of their board and at the same time take a course of practical lectures and field notes on botanical, entomological, geological, etc. subjects, with a view to the imparting such knowledge to the school children during the term. This seems to be a splendid idea if the teacher can make the subjects simple and interesting, and it might in time have the effect of reducing the necessity of the injunctions so often seen in public parks and gardens, "Keep off the grass," "Don't walk on the flower beds," "Don't pick the flowers." "No dogs allowed," etc., etc. At present many people have an impression that these are only mottoes got up by officious superintendents to save themselves trouble and annoyance, but it only needs a little common sense instruction given to children in an interesting manner (they do so like to know the why and wherefore of everything) to make them understand that the flowers, grass and trees are for the benefit of all and not for their own individual selves to wear or wantonly destroy. Prevention is better than cure, and teachers can do more good than the police court. E.

Boston.

At the time of writing, Decoration Day preparations are at their height, and the peculiar conditions prevailing in this most remarkable season have so completely puzzled both growers and dealers that the effect is almost equivalent to a panic. Carnations have jumped to $2.50 and $3 per hundred and even at that growers are loth to let them go lest they may thus miss a further advance. Roses are in the same condition. Nothing short of $8 per hundred is obtainable. But the snowballs, double hawthorns and weigelias are in full bloom out of doors and there are large quantities of rhododendrons obtainable, and the inflated prices are in no means certain to hold. Dried flowers and metal goods in every conceivable form and design are in all the florists' windows in quantity, and their sale is likely to be largely increased by the sudden advance in cut flower prices.

At Horticultural Hall on May 26, first-class certificates of merit were awarded to F. Sander & Co. for foliage plant Strobi-

lanthes Dyerianus, to Rea Bros. for Astilbe Chinensis, a pretty species, soft pink in color, and to James Comley for Hydrangea "Benigakee," a species which he brought from Japan; the flowers are white delicately shaded with pink and the edges of the petals serrated. Mr. Comley also showed a hardy white rhododendron with enormous truss of flowers, which he has named Mrs. Cleveland. Hybrid aquilegias from H. H. Cowing, pansies from L. F. Seaver and hardy herbaceous flowers from J. W. Manning and Rea Bros. were shown in profusion and were admired by a large crowd of visitors. N. T. Kidder exhibited a collection of perfect calceolarias in 8-inch pots.

The auction sale of palms from W. K. Harris was postponed from May 26 to May 29 on account of delay in transporting the goods.

Mr. Geo. Sykes, from Hitchings & Co. is in town.

Pittsburgh.

There has been quite a demand for plants the last week, both for bedding and for decoration. Good geraniums are scarce; only fair plants fetch $1 per doz. Cut flowers for the past week have been in great demand and not plentiful. For the past week most of the retail stores have been taxed to the utmost. Saturday (26th) the leading stores had not enough flowers left for a buttonhole bouquet.

Last Monday witnessed the twin city in holiday attire for the Conclave. There have been many decorations at the Alvin theater, but this one far surpassed them all. In front of the building were the different Templar emblems. In the center of the archway there was a floral emblem of the Knights, consisting of a Maltese cross in yellow immortelles and mounted with a crown and cross in purple flowers while the legend "In hoc signo vinces" appeared on the four arms of the cross. There was a profusion of evergreen, with palms and ferns almost hiding the interior. Inside the hallway there was only room enough for two to walk abreast, the remainder of the space being taken up with banks of palms and flowering plants beautifully arranged and interspersed with colored electric lights. The art gallery was also beautifully decorated and festooned with smilax. The decoration of the archway opening from the hall to the promenade lobby was a fine piece of work in the shape of a draped curtain made of maiden hair ferns.

The Monongahela House was also beautiful. The hallway on the first floor, the stairway and the corridors were lined with plants, while the dining room took on nearly the same dress as on Grant's birthday, the occasion of the American Club Banquet.

The Central Hotel was decorated in an artistic manner, also Newell's Hotel. The Masonic Halls of Pittsburgh and Allegheny were also elaborately done. Most all of the decorations were by Messrs. Elliott & Ulam and A. M. and J. B. Murdoch. But from what I can hear all of the florists had a share, as hundreds of bouquets were presented to the ladies by the different Sir Knights.

The Victorias regia and Randi are now in bloom at Schenley Park. A. J. B.

San Francisco.

At a meeting of the State Floral Society, Thursday, May 24, Rev. W. T. Hutchins, of Massachusetts, who has been spending three or four weeks on the coast in the interests of sweet pea growers, and who has made a very thorough inspection of the various farms devoted to this industry in different parts of the state, gave the society an exceedingly interesting talk, occupying nearly two hours and supplying much careful and exact data in connection with growing, roguing and purifying the various kinds given, and splendid opportunity was afforded to the speaker to illustrate his points, from the fact that over sixty named kinds were on exhibition, grown only as California soil and climate is able to produce these magnificent flowers. Mr. Hutchins expressed his delight and surprise at the remarkable perfection in size and color attained by the sweet peas on this coast, contrasting strongly with those grown in his own home in Massachusetts.

Business is very dull in San Francisco now. The Chinamen are running all over the city and selling flowers at ruinous prices.

Robert Armstrong, for years with the growing department of the Sunset Seed Co., resigned his position lately.

Mr. Lynch, of the Menlo Park Nurseries, is reported seriously ill with rheumatism. We all hope for his speedy recovery.

W. T. Hutchins, the great authority on sweet peas, is now here inspecting the fields of our large growers, and is delighted with them.

Wm. Robertson has started in business again in the California market.

W. D. E.

ALTON, ILL.—Edw. C. Paul intends to go into business here next fall and is planning to build a range of greenhouses this summer.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

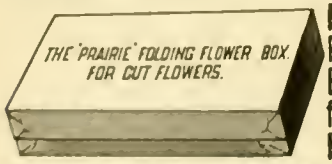
Address THE AMERICAN FLORIST CO., Chicago.

THE WORK recently done by Rev. W. T. Hutchins in a critical examination of sweet peas now being grown in various sections of California, will be of great interest to all florists and seedsmen who grow or sell these flowers. Mr. Hutchins has very kindly promised to supply the FLORIST with two or three articles covering the lines in which the greatest improvements are needed in this popular flower, and on which it is of the greatest importance that American seedsmen and florists be united and act together.

THE DINGEE & CONARD COMPANY'S trouble seems to have been brief, the court on examination, turning the business promptly back to present management. It was never thought possible by those acqnainted with the financial affairs of the concern that there could be any lack of funds, the existing trouble arising mainly from differences of opinion among stockholders.

DO YOU WANT a complete alphabetical list of carnations incommercein America, with name of introducer, date of introduction and brief, accurate description of each? You will find such a list in our trade directory and reference book for 1894. Price $2.00.



PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York. Next annual meeting second Tuesday in June, at Toronto, Ont.

HART, WELLS & Co. succeed E. Decker at Wethersfield, Conn.

CHARCOAL is one of the best preservatives known for short lived seed.

PROSPECTS for pansy seed crop in Germany are reported good on May 1.

VISITED NEW YORK: W. Atlee Burpee, F. R. Pierson, E. B. Clark, C. Ribsam, J. T. Lovett.

TRAVELING salesmen report florists as rather shy in giving import orders for forcing bulbs.

THE RAINS in California about May 15 have improved the seed prospects there, especially the onion fields.

SEVERE FROSTS have occurred in northern parts of Germany about May 12 to 15, damaging beans and other tender stuff.

MR. LEM. BOWEN, of D. M. Ferry & Co., now on an extended business trip in Europe, is at present in France and will return home about July 15th.

CHICAGO.—Mr. S. F. Leonard left for California May 29, accompanied by Mrs. Leonard. Mr. J. C. Vaughan has returned from his eastern trip.

MR. J. HULSEBOSCH, of Hulsebosch Bros., who has just made a five weeks' trip in the U. S., sailed for home via the Netherlands line Saturday, the 26th.

NEW YORK.—Mr. F. W. O. Schmitz has gone on a European trip. He will return early in July. Mr. J. W. Eldering is making a business tour of the middle states. Mr. C. Cropp will sail for Europe on June 2. Mr. J. C. Vaughan of Chicago has been in town for the past week.

MRS. S. Y. HAINES, wife of the well known seedsman, died in Minneapolis, May 23rd. Hers was a rare, kindly and unassuming nature, and she was much loved and esteemed by all who knew her. Mr. and Mrs. Haines were inseparable in their married life and deep sympathy is felt at his sad loss.

THE FROSTS of May 25, 26 and 27 in many places in the west and southwest have seriously damaged the tomato and melon plants as well as many small fruits. The hard frosts in the neighborhood of Waterloo, Neb., on the night of the 18th were not thought to have occasioned serious loss beyond repair.

THE PROGRAMME for the meeting of the American Seed Trade Association at Toronto, beginning June 12, is in the hands of the members. The topics are all of general interest, and this first gathering on Canadian soil should be a large one. It is understood that the attendance of wives of members will be larger than usual, as the trip affords an excellent opportunity to visit the Falls.

PHILADELPHIA.—John Gardiner & Co. have secured a new location at 631 Market street, whither they will move as soon as improvements are completed, which will probably be before July 1. They will occupy the whole building, five floors, and will have more than double their present room. Z. De Forest Ely's seed window has been temporarily given over to a unique scene representing a member of the G. A. R., decorating a soldier's grave with metal wreaths. Mr. Ely reports a very heavy Decoration Day demand for these goods.

OUR SPECIALTY!

True Stock. Lowest Prices. Best Quality.

F. R. PIERSON CO.,

TARRYTOWN-ON-HUDSON, NEW YORK.

CHEAP FLOWERS

During the whole season from Christmas up to Easter.

There are thousands of people who at Easter time want to purchase a plant, but their limited means won't allow them to purchase an Azalea or even a dollar Lily. They want some little plant for 25 cents, and this should not be lost sight of. A Dutch Hyacinth or 4 to 5 Tulips or Daffodils in a 4-inch pot fills the bill.

Rich and poor alike will buy a flower for Easter. Hard times or prosperity—free trade or protection—won't affect it.

SEGERS BROTHERS,

WHOLESALE BULB GROWERS,

LISSE. near Haarlem, **HOLLAND,**

Offer HYACINTHS, TULIPS, DAFFODILS

And all other bulbs for forcing and outdoor, in extra fine quality, at very low rates.

Always mention the AMERCAN FLORIST when writing to advertisers.

Always mention the American Florist when writing to advertisers.

Baltimore.

There is no lack of rain, and even when water is not actually falling from the skies the ground is in such a saturated condition that planting operations are almost entirely suspended. At this writing, though, clear weather flags are flying from the signal stations, and the indications are that summer is fairly upon us.

The same old cry is heard of price cutting now and then, and the price cutters of one season are very frequently the loudest talkers of the next. It is no doubt very discouraging to see prices drop, but on the whole it may be doubted whether they have dropped any more in flowers and plants than in every other merchantable commodity during the past decade, and it may also be doubted whether price cutting is any worse among florists than among every other class of tradesmen. It is one of the asperities of life that we have to become accustomed to, and to hear a man denouncing it continually is rather a suspicious sign.

"One usually suspects in others the faults he finds in himself" you know.

Sales in cut flowers are far from being entirely out of accounts, though plants are the money makers for the time being. First-class flowers sell fairly well yet, but are not as plentiful as might be expected.

MACK.

Chestnut Hill, Pa.

Edwin Lonsdale is greatly interested in three begonias, each distinct, which have come up from seed among some Cattleya Mossiæ recently imported. While he does not claim as yet that these begonias are not in cultivation, still they are new to him and the chances are in his favor. He has a handsome yellow carnation which has sported from Helen Keller. In color and markings it closely resembles Buttercup, but if it proves to have with the Buttercup color the superior points of growth and blooming which are characteristic of Helen Keller he will indeed have a prize. Among the roses Mr. Lonsdale has planted for next winter's flowering is a fine bench of Rodocanachi. He has observed that it seems more prone to mildew than any other hybrid.

John Burton has just rebuilt four large houses and will add more in the fall. He will go heavily into carnations and has 12,000 of these now planted out. Mr. Kennedy, the foreman, says that Grace Battles does well with them if kept indoors and not planted outside at all, and that their faith in this variety is demonstrated by the fact that they propose to plant two houses exclusively with it.

Hartford, Conn.

The Hartford County Horticultural Society meets regularly on the first Wednesday of every month at the county building. There will be an exhibition of flowers, fruit and vegetables about middle of June, another early in September and a chrysanthemum show in November. Late in March, 1895, the spring exhibition of flowering bulbs, roses and carnations will be given.

DO YOU WANT the census statistics regarding the florist, nursery and seed trades? You will find them in our trade directory and reference book for 1894. Price $2.00.

THE AMERICAN FLORIST and *Gardening* together to one address for $1.75. Send orders to the American Florist Co.

THE AMERICAN FLORIST CO.'S DIRECTORY AND REFERENCE BOOK

FOR 1894

CONTAINS THE FOLLOWING:

1. The names and addresses of the Florists, Nurserymen and Seedsmen of the United States and Canada, the exact branch of the business each is engaged in being indicated.
2. A separate list of firms that issue catalogues, the space devoted to each branch of the business in each catalogue being also given.
3. A list of the names and addresses of superintendents of leading parks in the U. S. and Canada.
4. A list of the principal cemeteries of America at which the arts of the landscape gardener and florist are used in beautifying the grounds.
5. A complete, alphabetically arranged list of Roses in commerce in America, with class, habit of growth, date of introduction, name of introducer, and brief, accurate descriptions of the flower of each. Synonyms are also plainly given.
6. A complete, alphabetically arranged list of Chrysanthemums in commerce in America, with class, and brief, accurate description of each. Synonyms are noted and varieties that are very popular with American growers are designated by a star, and this year's introductions by a dagger.
7. A complete, alphabetically arranged list of the Carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each.
8. Seasonable Hints for the year, arranged in weeks, written by Mr. William Scott, and covering every detail of a general florist business. This is decidedly the most valuable contribution to the literature of the trade ever published. It is written in a plain, practical way, by a man who knows what he is talking about.
9. A historical sketch of the Society of American Florists from its organization to date, including officers for each year and lists of essays read at each meeting, with other information of interest.
10. A similar historical sketch of the American Association of Nurserymen.
11. A similar historical sketch of the American Carnation Society.
12. A similar historical sketch of the American Seed Trade Association.
13. Similar historical sketches of the Florists' Hail Association of America; of the National Chrysanthemum Society of America; of the Florists' Telegraph Delivery Association.
14. A complete list of all National and Local Trade Organizations, with names and addresses of principal officers, time and place of meetings, etc.
15. Statistics of Commercial Floriculture in the U. S. from the last census.
16. Statistics of the Nursery Industry in the U. S. from the last census.
17. Statistics of Seed Growing in the U. S. from the last census.

JAMES CHALK, Norristown, Pa.

The Convention Exhibition.

The entries for the exhibition at the S. A. F. Convention, Atlantic City, next August, are coming in very well. About one-half the available space has already been applied for and everything points to a large, varied, and representative exhibit. Quite a few novelties that have never before been properly presented to the commercial florists will be shown, among them being remedies for carnation rust and anthracnose and violet rust and other fungous diseases, prepared under the formulas of Professor Galloway and Professor Riley, who have done so much of late years to extend our knowledge in vegetable pathology and entomology. Entries close July 21 with G. C. Watson, Superintendent of Exhibition, 1025 Arch street, Philadelphia, who will furnish application blanks and all information on application.

St. Paul, Minn.

Favorable weather during the week has kept the florists on the move, and trade has been very satisfactory. Cut flowers have not sold as readily as plants, still there has been no surplus and no cutting of prices in that line, and Saturday night practically finds everything cleaned out in the cut flower line.

Roses are still held at $1 per dozen, carnations at 30 to 40 cents. Some fine Daybreaks are still seen and sell readily at 40 cents, where others are bringing 25 and 30 cents. While the number of Daybreak planted the last year was small, still it has given such general satisfaction that every grower will plant largely of it another season.

In bedding plants nearly everything is selling readily. There is a large demand for roses and ivy geraniums, also S. A. Nutt and Mrs. Beadsley geraniums, they being the leaders in their respective colors. Coleus are not selling quite as well as usual. Carpet bedding is going out of date in this section, and beds of showy geraniums and other flowering plants are taking its place. FELIX.

I. N. KRAMER & SON,
CEDAR RAPIDS, IOWA.

Grow Swainsona.

The best and most profitable pure white flower grown. Takes the place of Roman hyacinths or lily of the valley, producing spikes of flowers from 4 to 6 inches long, in the greatest abundance the entire year—never out of bloom—lasting well when cut. 100 Swainsona will pay you three times as much as same space in best carnations. No florist should be without this most useful flower. After a trial it will be considered indispensable.

EASY TO GROW.

An exceptionally good and paying cut flower.

Strong young plants, $6.00 per 100.
Larger ones, $10.00 per 100.

Begonia Vernon, strong 2-inch	3.00

THOS. A. McBETH, Springfield, Ohio.

Cleveland.

The various florists who suffered damage by the recent hail storm estimated their losses as follows:

D. Charlesworth	$2,000
Archibald Campbell	200
Mrs. Jane Eadie	300
Gordon Gray	50
A. Graham & Son	50
Frank Hills	800
Robert Hughes	800
Harry C. Jaynes	500
Total	$4,700

There are others more or less damaged which will raise the total loss to nearly or quite $5,000 in round numbers. Private greenhouses will perhaps double this sum. It is safe to say it was the worst hail storm which has visited this city, in the memory of the writer, who has resided here 57 years. A. C. KENDEL.

Trees for City Use.

ED. AM. FLORIST: It is very pleasant to me to read the many favorable notices of my essay on trees for city use, which I read before the Pennsylvania Horticultural Society. In your issue of May 3rd, Mr. Keffer kindly refers to it, and to the list of trees mentioned by me he suggests the addition of the elm, box elder, American sycamore, hackberry and the thornless (yellow) locust. I would say of these that in our city the elm is so much troubled with insects that I could not recommend it. The yellow locust is too much troubled by borers to allow of its use, beautiful as it is. I have never seen the box elder used as a street tree. Doubtless the Western form of it, which is much more tree-like than our Eastern one, would be good for the purpose, and I will keep it in mind. The hackberry grows wild with us, but, somehow, it does not seem to be just what we want in a shade tree. There seems hardly foliage enough. The native sycamore is just as good a tree as the European species. The latter, however, is thought to be less liable to the fungus attack which so disfigures the native one in some situations.

FRANCIS' METAL STEMMING POINTS.

PATENTED JULY 11th, 1893.

Latest Device for Stemming Cut Flowers without Toothpicks and Wire.

Will keep set pieces fresh longer, as flower stem is entered deep in the moist moss. Made from solid brass, will not rust, very convenient, saves valuable time and labor. You can stem flowers with these points in one-quarter of the time as when done with toothpicks. Will hold a pansy as well as a calla lily. Manufactured by the Novelty Point Works in 5 sizes, from ⅛ to ½ inch in diameter.

In Boxes of 1000 Points:

Questions About Heating.

Replying to the inquiry as to how large a tubular boiler would be needed for heating eight houses each 20x100 and 11 feet high, to be used for forcing roses in the latitude of Chicago, would say that to maintain a temperature of 55° to 60° during coldest weather ten lines of 1¼-inch pipe would be required in each house; this, with the surface in the mains and the allowance for friction, etc., would make 555 square feet of heating surface in each house, or 4440 square feet in the eight houses. To operate this amount of surface the boiler would need to contain about 700 square feet of heating surface and should have 20 feet of grate surface, which could best be provided for in a boiler 15 feet long, 54 inches in diameter, containing 64 3-inch tubes, which would be 60 horse-power.

In reply to the question propounded by Mr. Geo. Ellison of Ft. Worth, Texas, would say that probably the best method of piping a greenhouse where the boiler is placed on the same level with the house is to carry the main flow pipe upward from the boiler to a level as near the top of the house as convenient, relieving it at that point with an expansion tank, and from there carry one or more pipes through the house above the benches, dropping all the way to the farthest end of the house; there divide and return underneath the benches, continuing to drop until the boiler is reached, where the pipes can raise if necessary to enter the return inlet of boiler. At the lowest point in the apparatus there should be a valve to draw off the water in the system should it be necessary at any time to do so. The pipes running along the house above the benches can be suspended from the rafters or sash bars and covered with a non-conduction covering if the heat from same should be objectionable.

LINCOLN PIERSON,
Sec'y Lord & Burnham Co.

Our Illustrations.

ED. AM. FLORIST:—I want to express my admiration for the superb half-tones you are constantly printing in the FLORIST of plants, designs, etc. Not only are the subjects well chosen, but the photographing is accomplished with rarely good results, as witness the beautiful details of the adiantum and lily of the valley in the pictures on pages 1011, 1013 and 1015 of the current issue. The excellent engraving and printing result in conveying to your readers almost a perfect reproduction in one color of the subjects chosen.

Long years of labor in this field, together with some acquaintance with photography, enables me to appreciate very fully the excellence of the work you are now doing. As florist printer, with intimate knowledge of the difficulties of reproduction you are so successfully surmounting, I believe I am more than ordinarily able to judge the result.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

TO TAKE PLACE OF WIND MILLS

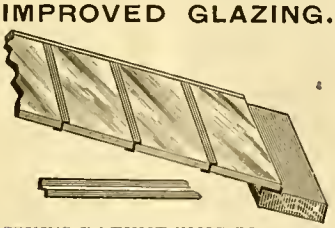
HOT AIR PUMPING ENGINES

A Windmill

Is unreliable because it depends upon the elements for its power; hydraulic rams also depend upon favorable conditions and waste as much water as they secure. Steam pumps require skill and hand pumps demand labor and time. The

DE LAMATER-RIDER CR DE LAMATER-ERICSSON Hot-Air Pumping Engines

are especially designed for pumping water, and from shallow streams or any kind of well. They are simple, safe and reliable, require no steam and have no valves. They require very little heat to operate them, and can be arranged for any kind of fuel.



Send for illustrated catalogue to

THE DE LAMATER IRON WORKS,

87 South Fifth Av.,

NEW YORK, N. Y.

IMPROVED GLAZING.

GASSER'S PATENT ZINC JOINTS for butting glass makes greenhouses air and water tight; also prevents sliding and breakage from frost. Does not cost as much to heat a house glazed with the joints, thereby saving enough in fuel to more than pay the additional cost of glazing. The leading florists of the country are using them. Write for circulars with full particulars and price list.

J. M. GASSER, FLORIST,

Euclid Avenue, CLEVELAND, O.

THE CHAMPION Automatic Ventilator.

Seasonable Notes.

The spring bedding is now pretty well advanced, and in a great many localities almost finished, so the greenhouses may be cleaned out and got ready for planting the chrysanthemums. And if there is some bedding stock left in, move it out, for it will be far better off in frames than in the houses.

After removing the old soil, look the benches over carefully; and if they are rotten *tear them down and build anew.* Don't throw your weight or spring upon them to see if they will bear you without breaking down, and if they are not wrecked say "I guess they'll last another year," but remove all the rotten wood now. It may mean a little expense, and you can't perhaps afford it, but the loss of a crop is far worse than the output of a few dollars, for benches that are what appear to be only partly rotten are liable to break down and let the plants and soil through; but anyway rotten wood is a perfect harbor for vermin of all kinds, especially sow bugs or wood lice. We have been told by some very good growers that this little chap does no injury, but we, to our sorrow, know different, for they nearly ruined a fine bench of Ivory for us last fall, and we caught them in the act. They would climb up the stem to the flower and eat off the lower petals. I saw an item the other day from Mr. A. W. Fox of Mt. Pleasant, Penn., saying "D. Maurer & Son's Cockroach Exterminator" would rid the benches of this little pest; I could not procure that make, but tried another, "Barnard's," which the druggist of course informed me was "just as good," and the bugs paid no attention to it whatever; but it is an inexpensive experiment, and as soon as I can procure the make advised I intend to try it.

Build your benches so that they will hold about four inches of compost; we have found this plenty deep enough to carry the plants through the season, but they will of course require top dressing and liquid manuring and careful attention throughout the hot days of late summer.

As soon as the cuttings are rooted take them out of the propagating bench, and on no account allow them to make any appreciable growth in the sand, for wood grown in that way is very weak and hardens very quickly later if allowed to dry ever so little. It is the usual custom, we believe, to pot the cuttings into small pots, but for the last three or four years we have planted them in flats, in the same manner we do our carnations; that is, if they are going to be planted out in the benches within six weeks. It would be a dangerous experiment to try to carry them much longer than that in shallow flats, unless they were planted three or four inches apart. We prefer this to potting, for they are much more easily handled, grow stronger, do not dry out so quickly and a man can set out as many plants again from flats as he can from small pots.

Societies intending to hold exhibitions next fall have nearly all issued their schedule of prizes (and those that have not should do so at once), and you have selected the varieties that you will need for trade purposes, so you are able to map out what you are going to grow. Plan out now in your mind if you can, but what is far better, on paper, just how you are going to set your plants in the benches, for an hour in the evening spent in doing this will save you lots of delay and trouble when setting the plants. I

the benches run east and west plant the tallest growing varieties, such as Pres. W. R. Smith and Harry Balsley, in the back row and grade the rows to the front of the bench according to their heights; or you can set all of a variety together in rows across the bench, which is usually preferable, for the plants are not as apt to be mixed or run together when you select the stock plants in the fall. But, be sure, if you plant the latter way, not to get a dwarf between two taller varieties, or you will draw the dwarfer one so that the bloom will be small and the stem very weak. In benches running north and south plant the taller varieties at the north end of the house. If you are intending to grow any quantity of Ivory (which you ought if you are not, for it has not yet been equalled as a semi-early white), plant them in a bench by themselves, for they will stand closer planting, and it is good economy to grow them on what is called the Japanese system, single stem and single flower.

ELIJAH A. WOOD.

West Newton, Mass.

TO PREVENT RUST.—Dissolve one pound of sulphate of copper in two quarts of ammonia in a 2-gallon jar. When dissolved add another quart of ammonia and stir well. [The liquid can be kept in this form for some time and used as needed.] Add a pint of this solution to a barrel of water and syringe the plants with a force-pump every two weeks. And don't let the time for spraying pass without attending to the operation.

Carnation Notes.

About this time of year almost every carnation grower is thinking of adding to his glass, quite a number are starting in new, and a few remarks about houses may not be amiss. There are almost as many different ideas as to the proper house for carnations as there are growers. I do not claim that mine are right, but my houses are turning me out fine carnations, and they at least are not wholly bad.

For colored sorts the best houses with me are those running north and south. These are built on the ridge and furrow plan and they are nine feet wide, with a two foot path under each gutter plate; this gives a good bed in the center seven feet wide and away from all drip and shade from the sides. You will of course understand that there are no partitions between these houses. The paths are dug out about eighteen inches to two feet and bricked up; resting on these bricks are uprights that support a cross piece which supports the gutter; these are all iron. The uprights are best made of inch and a quarter pipe and the cross piece of solid iron; they will then stand as long as the roof lasts, and make a very neat interior. Houses of this width do not need any purlins, as the roof holds itself easily. Six or eight houses of this style in a block make a first-class arrangement, as their being all open insures a good circulation of air all through them, which contributes greatly to the health of the plants. It is not necessary to go into the details of building, but I would suggest that the gutters be made as narrow as practicable, so that they do not cast much shade. The material should all be good. Use first quality of double thick glass and put the ventilators on the west side of the house, a continuous ventilator running the whole length of the house and opening at the ridge. Ventilation and sunlight are very important features in carnation culture.

I am not prepared with data to say whether or not those houses will make as many flowers from the same variety as the three quarter span houses will, but there is a very slight difference, if any, either way, and the plants seem to be healthier and require a little less labor in such houses than they are and do in the three quarter span houses.

Anyone building but one or two houses will do better to select the three-quarter span, as such houses as above described are not so good unless you have a block of them. The three-quarter span house has been written up so often that it is not necessary to make any comments on the building of it. Quite a number of the growers are favoring the long span to the north method of building these houses, which enables them to be built together without much disadvantage. In these houses I follow the same plan except that I build mine all with the long side to the south and each house twenty feet away from the other. In place of having a bed or bench along the south side we put a two-foot path along that side, and give the carnations the benefit of the best part of the house in the center. These houses should have ventilation on the sides as well as on the top, so that when the warm spring days come one has plenty of it.

In building a greenhouse you do not want to be too economical, as you will be more than likely to grow cheap flowers in cheap houses, and cheap flowers are a nuisance everywhere, to the man that grows them, as well as to the man who sells them. If you cannot put up a good house and grow good flowers you will be far better off a year from now to have gone to work for some one at a fair salary. It takes but a glance over the market reports to see that competition is going to be livelier every year, and it is well to remember that even the market reports (that is the quotations of prices) are as a rule higher than the actual returns to the grower.

On account of the heavy rains we have been getting, through this state at least, carnations are growing very fast, and they will need watching to see that they do not suffer for want of topping, and that they are kept well cultivated and clean.

A. M. HERR.

ULRICH BRUNNER BUD AFFECTED BY THE NEW PEST

Another Pest.

Several forcers of hybrid roses have been experiencing considerable trouble and loss from damage caused by the larva of a winged midge which is as yet unfamiliar to entomologists. Our illustration shows a bud of Ulrich Brunner as it appears when infested. The grub is very minute but may be seen by close examination in the under side of the deformed bud while it is in a very young state, but by the time it has attained the size of a pea the grub disappears. Those who have been troubled with the pest say that it never makes its appearance except on late forced hybrids, that is those that should bloom in April and May. The bud generally turns yellow and drops off, but in the case of very strong growing

MILTONIA VEXILLARIA VAR. FAIRY QUEEN.

varieties such as Magna Charta it sometimes attains a sort of one sided half developed bloom, but which is useless as a cut flower. Prof. Riley of the Division of Entomology of the U. S. Department of Agriculture, to whom specimens of the infested buds have been submitted, says that the adult form of the insect is yet unknown to entomologists, and that no precisely similiar case has ever been called to his attention. His advice is to burn the infested buds that contain the larvæ and also suggests that a top dressing of Kainnit applied to the soil about the infested buds would destroy the maggots. If any of our readers should notice this damage later during the present or next year the entomologist will consider it a favor if they will send specimens for his examination.

Miltonia vexillaria var. Fairy Queen.

The illustration does not convey any idea of the true beauty of this orchid. Many varieties have cropped up these past few years from importations; including the brilliant colored radiata, the bright Augusta Victoria, the immense forms stupenda and Joseph Godseff, the choice coronna marked Amesiana and the several white forms, alba and Cobbiana, all beautiful; but the subject under notice, Fairy Queen, is purity itself.

It was introduced by Sander & Co., and was sold to Mr. Ames. A choice piece three years ago having two small bulbs, it has now five flowering growths and carried about fifty flowers. The flowers are medium, the lip absolutely white, the crest yellow with fine radiating lines of yellow spreading through the lip, the sepals white, petals faintly flushed pink on opening but the pink disappears. Two years ago the flowers did not have a particle of coloring in petals.

We grew the plant during the time it was developing its flowers in a shady and warmer part of the cattleya house, since which time we have continually grown it in the odontoglossum house at the more exposed end. The temperature during winter was, night 50° to 55°, day 58° to 60°. I find all vexillariums grow well under these conditions, always giving plenty of atmospheric moisture and ventilating freely on favorable occasions. We drench them overhead and they enjoy it. We are not troubled with yellow thrips; we have them sponged thoroughly probably three times a year. Our season of vexillariums extends from early April until September. After the larger type has finished flowering the smaller and higher colored type rabella follows and they come at a season when orchid flowers are scarce.

WM. ROBINSON.

North Easton, Mass.

Forcing Prunus Pissardi.

It is probable that, now it has proved so amenable to early forcing, it will become as popular in early spring as in the open air in summer. It is a lovely shrub with beautiful foliage of a ruddy tinge, but not so deep as they will become later on. The flowers are produced in great profusion, and shaped as other cherry blossoms. They are of a delicate blush white. The flowers resemble those of Prunus cerasifera, of which no doubt it is a variety. I understand this variety does not come true from seed, as green-leaved seedlings have been produced.

A. J. E.

DR. WM. TRELEASE has just issued a brief but comprehensive monograph on Leitneria Floridana, an interesting but little known tree chiefly found in the Florida swamps. Like all the publications of the Missouri Botanical Garden it is fully illustrated. It will be reprinted in the sixth annual report.

Seasonable Hints.

I have frequently endeavored to remind my friends in the trade not to let out their fires until the 1st of June, or even later should an extraordinarily cool wet spell occur, as it has this year. And this is good advice for any year. From my observations locally I have seen the loss of many thousands of fine geraniums, trusses and leaves rotting and turning yellow, roses mildewing, and even carnations standing still, coleus losing all their bright coloring, for which alone they are attractive, all this for lack of a little fuel, and care. I am not saying that carnations have needed fire heat for seven or eight weeks, but the last week of May, just when the flowers paid well, the temperature of the houses was 40° to 45°. A ton of coal then would have paid its cost many times over.

You will be in the rush of business now, and very liable to neglect a few important operations. Don't forget the poinsettias. Those you started into growth early in April will now have made growths four to six inches long. Find time to cut off the young shoots, and leave enough of the young growth on the old plant to break and make a decent plant. The young growths with two or three joints will, if put in the sand and kept continually moist, and never allowed to wilt, root in about twenty days and if potted and grown along make the best of plants for next Christmas trade. After being potted off from the sand and well rooted in small pots they should have full exposure to the sun either inside or out. I keep the young plants always under glass. The old plants and plants struck from the dormant wood in April do better plunged outside on a dry bottom, and remain there until the end of September, or until danger of frost.

There should be no delay in getting your azaleas out of doors, either plunged in a frame on some material such as tan bark, spent hops, or coal ashes, if you have nothing better. Large growers of azaleas plant them out in some good soil, or soil that is thoroughly friable, and cover the surface of the ground with hay or some other mulching; whichever you do watch them closely during the hottest time, and never let them suffer from extreme dryness. Don't spare the hose on them, a good skillful syringing will help wonderfully to keep down spider, thrips and mealy bug. Try and handle a hose as expertly as some of you do a pen, realize that all the pests which succumb to cold water are on the under side of the leaf, and the spray must be directed to that part of the plant. Some may wonder innocently why these little pests (to us) should always be underneath the leaf. It is simply because they could not exist on top; the rains would have exterminated the races long before florists began to think of anti-pests. In fact they are like all other animate nature, of whatever kind or condition, either animal or vegetable, they did not find a place or surroundings especially made for them, but suited themselves to their surroundings, and so survived.

Hydrangeas that were propagated in February, and are now in 2½ or 3 inch pots should be planted out at once. A good rich soil that is not too heavy will do. They should be stopped once before planting, or soon after planting. I have been very successful the past two years by planting them in a violet house about this time of year. There was 5 inches of soil in which the violets had been growing, and with the addition of a good liberal allowance of bone meal the hydrangeas did finely. In the house you have full control of them, and can keep them well supplied with water and syringe. Young plants from 2½-inch pots now should give you fine plants in 6-inch pots with 4 and 5-inch large flowers by next May.

It is not too early to remind you to plant out a few of everything you need for future stock. A few plants will be sufficient of many kinds, but get them out and growing. Many retail greenhouse men can ornament their grounds with the very stock that they want for next year, and it behooves them to do so, for if they make handsome and attractive beds they will have advertised the plant they want to sell, and will have plenty of it to sell. Carpet bedding in our locality seems sadly on the wane; it's had its day, although beautiful and in good taste in some places. Don't place too much dependence on the little needs but plant out plenty of good geraniums for next fall's propagation, for old as they are they have a firmer grip on the public favor than ever.

Another plant that is greatly in favor, and without doubt will be for some years is the Crozy canna in all its wonderful variety. Buy them now for your stock; a plant bought now and planted in rich soil is good (with proper management) to make half a dozen for next spring's sale. This is much cheaper than buying the half dozen next spring.

When you plant out a permanent bed of roses, or if you don't do that select some end of a house for a few plants of Swainsona galegifolia alba. It is one of the most useful plants for the general florist that has been brought to notice lately. It is just like a small sweet pea (not very small) and is continually in flower. The flowers last well when cut. It should be tied up or supported to a pillar or post, but cannot be called a climber. A temperature of 45° to 50° at night will suit it well, and it likes and needs a good rich soil; a good turfy loam with a fourth or fifth of rotten manure will grow it, but there is no secret in growing it, only get a few plants and plant them out where they can remain a year or two, without being disturbed. You will find it invaluable. WM. SCOTT.

Arrangement of Flowers.

VI.

DRESS BOUQUETS.

One of the most popular uses of flowers is for personal adornment. As is but natural the ladies are the largest buyers of flowers to be so used, and not only does she use by far the largest part of the material for such purposes, but nine times out of ten will she also prefer to be her own artist in the arrangement. There is no denying the fact that the average woman is a better judge of color combination than the average florist, at least so far as harmony in color of flowers and dress goods is concerned. Of course there are exceptions to most rules. Not every woman dresses in the best taste, but in a general way you may trust a woman to select the proper thing. Now if our dealings were altogether with the fair sex we would find little to worry about except that you might be expected to trot out your stock of several hundred roses and other material, wherefrom (if satisfactory) to select 3 or 4 buds; and in some cases, according to directions, you might also be commissioned (subject to alterations) to arrange the same. But fortunately, or unfortunately, just as you take it, here is the masculine member of society to deal with. As a rule you find him a most liberal being, especially before he is married. He will come and throw down a five dollar note with the direction to fix something to wear, say a dozen or two of red roses. "What colored dress is the lady to wear?" Bless your soul, that simple matter has never entered his head. He will be able to describe the lady's eyes, and—yes, surely his lady has a lovely dark complexion and you know that red roses ought to be very becoming—why, certainly, he is sure of it now, for didn't she wear a red rose in her hair the other night, and wasn't it perfectly stunning? If you are a wise man or woman and value your reputation you will quietly drop your five dollar note in your drawer and send the money's worth of loose roses in a box and substitute one-half of different shades, and trust to the lady to select the proper color. She will most likely use but a small portion of them, and enjoy the rest by placing them in a vase in her room. And here comes the married man in a great rush. He has been commissioned by his better half to order some kind of flower, blessed if he hasn't forgotten the particular kind. With his mind, as is most likely, on the wheat pit or the corner on pork, what else could you expect? Dress? Well, he has a fleeting recollection that the bill for the same was some $200, but such a small matter as color! But stop! He recollects it isn't black and it isn't red nor blue, green or yellow but something between all of them. So there you have it. Let a man alone for describing the color of a dress. But enough! We only wish to emphasize the importance of color harmony in flowers and dress. It is not our purpose at present to go into this subject of color combination at length, reserving this fruitful topic for a future article.

Let us now consider the arrangement of the various styles. As fashion continually changes in the style of dresses, so also in a less degree there are changes in the forms and size of dress bouquets. Some years ago corsage and belt bouquets of enormous size were considered the correct thing. It was no uncommon sight in those times to see a frail little damsel fairly staggering along on the streets under the weight of a dozen or two of Am. Beauty roses. From a business point of view we may regret that at the present day fashion has gone almost to the other extreme, but from the standpoint of good taste we must condemn the ridiculous practice of wearing those enormous bunches, often made of the largest and coarsest flowers to be found, which gave the wearer the appearance of a walking flower garden.

The size of the bunch worn at present varies of course in accordance to the taste of the wearer, although we seldom see a bunch now-a-days with more than a dozen of the smallest roses or proportionately less of the larger varieties. The large roses, such as Beauties and hybrids, also peonies, chrysanthemums and other large forms of flowers, are generally worn as single specimens, or at least not more than 2 or 3 in a cluster, which are not subject in a general way to any particular arrangement. Of the smaller varieties in roses let us consider several different styles and forms, such as are in demand at present.

Our first illustration shows a style generally termed "corsage," although the word corsage is often applied to all the other forms of dress bouquets. A typical arrangement in this class is the one shown on the right hand side of our picture made in long spray form. This is made of

ILLUSTRATION NO. 1.

ARRANGEMENT OF FLOWERS.

Bridesmaid roses and adiantum fronds, but of course the color or variety of our material must be varied to be in harmony with our object. The manner of arrangement is so simple that it can be seen by a glance and very little description is necessary. First of all be careful to break off all the thorns from the rose stems, as there is great danger of tearing the dress with them, not to speak of the annoyance of pricking delicate fingers in handling them. If these arrangements, as is most likely, are to be worn at receptious or balls where there is often a crush with danger of having every bud broken off in the first five minutes, it is best to run a wire through the calyx of the rose and wind around the stem in the manner shown in our article on stemming. In such a bouquet, however, it is almost impossible to arrange the flowers so that the wire will not show more or less, particularly after being worn a little while, when some of the flowers become disarranged, and therefore is objectionable. For tying these bouquets we prefer thread or silkaline to wire as the latter, if the flowers are wet, is very apt to injure the dress. These remarks apply to all the other rose arrangements as well, as all of them differ only in form.

The left hand spray, as seen on our first plate, is composed of Mme. Pierre Guillot roses and adiantum.

The second plate shows a bunch of La France and adiantum on the right, and on the left a cluster of three Kaiserin roses with buds and foliage and no additional green.

The third illustration is of a bunch of Tidal Wave carnations and Asparagus plumosus, one of valley and its own foliage, and one of Nellie Jaynes sweet peas and adiantum.

But as the ladies' dress bouquet has grown smaller and more modest so in the same degree has the gentleman's boutonniere asserted itself until it has become of a size to be a formidable rival to the former. For swell occasions a modest rose bud or carnation isn't in it any more. Happy is the dude in the chrysanthemum season, for then he can indulge to his heart's content (if he has the price) by purchasing a bloom as large as a good sized saucer. Unfortunately the chrysanthemum is not always in season, but the enterprising florist is equal to any emergency and he is ready to manufacture out of carnations (white for evening wear) a rosette as large as a cabbage if so desired. Of all the abominations that have ever appeared on the horizon of fashion this is about the worst. We have often thought that if we were able to put our eye on the fellow who invented this dainty arrangement we should be tempted to shy a brick at his head.

As to the "arrangement," take a number of good sized carnations from half to a full dozen or more, strip off the calyx and pull out the seed pod, then wire the remaining leaves together and form the whole into a ball, the larger the better, and there you are, right in the swim!

Another style much in favor in the winter season is a similar arrangement of violets, anywhere from 25 to 100 in the bunch.

We must however acknowledge that the majority of men have better sense and taste. For those we recommend a single bud or half blown rose with a leaf behind it, or a carnation without any green, a dozen blooms of violets with a leaf or two of their own foliage, or a couple of sprays of valley, also with a small leaf at the back.

Sweet Peas in California.

I have just returned from a visit to the California seed growers. Although I was especially invited by C. C. Morse & Co. of Santa Clara, whose acreage puts them at the head of the list, and spent my time chiefly with them, I was warmly welcomed by the Sunset Seed Co. at Menlo Park, Menlo Park Nurseries of M. Lynch, J. H. Kimberlin of Santa Clara, and F. E. Grey of Alhambra. The Morse company and Mr. Kimberlin have both been extensive vegetable seed growers for years, the former having to-day over twelve hundred acres in vegetable seed, the latter being best known as a grower of onion seed. The other three are practically in flowers and flower seed. The Sunset Seed Co. are an outgrowth of Timothy Hopkins' beautiful estate and park at Menlo Park, and Mr. Lynch, formerly Mr. Hopkins' gardener, has now gone by himself extensively into cut flowers, and the growing of the particular seed of which I want to write. F. E. Grey at Alhambra has taken into his employ Mr. Haettel, who was a year ago in the business for himself.

My visit was in the general interest of sweet peas, the seed of which has now become an important California product. Sixty tons of the one hundred needed in this country will this year be grown by these five named growers. With your permission I want to write three chapters on this visit, in one of them discussing the present status of growing the seed, and points involved in this new American seed product; in another discussing the list of varieties, and showing how now the time is come to cut it down from about seventy to fifty named sorts with great advantage all around. The third chapter I will hastily write first to get it to you in time for the Seedsman's Convention, and make it simply a brief report of what I saw.

I have both come away very enthusiastic myself about the way they are taking hold of this branch of seed growing, and have left them in an equally enthusiastic condition. The day I left, May 24, a special meeting of the California State Floral Society was held at San Francisco, at which, besides a good attendance of the members, the four largest growers of seed were present. A magnificent exhibit of the finest varieties covered the tables, and I went over such points in their history and development as were interesting and important. While I have spoken before several large Eastern societies on the sweet pea I have never spoken under circumstances of more enthusiasm, or where I felt more good would come of it than right there with the Menlo Park and Santa Clara growers closely observing each point. Each grower represented from forty to two hundred acres of the different varieties. The latest varieties were there shown in liberal bunches, and blossoms of a size that cannot be seen outside of California. The growers there saw the true and finest type of each, and saw the standard to which their seed stock must be brought, and the types to which they must rogue every acre. It was a simple matter to correct what few mistakes they had been making in the names

of the varieties. And in my visit to them all I could see that the conditions of soil and climate are about as perfect as can be for the best sweet pea seed. The soil is of course deep and rich, and of that heavy texture favorable to this flower. I went again and again over the Morse seed ranches, one of them having thirteen hundred acres solid of different kinds of seed. To stand on a water tank and look over its immense blanket of color, every square rod occupied and worked at its best, blocked out with acres of this and acres of that, squads of Chinamen busy as bees, and doing exactly as they are told—a single seed ranch requiring 40,000 bushels of onions to be set for seed, also cabbage seed, lettuce seed, spinach seed, carrot seed, etc., so that if you could look over their orders from the big seed houses in Detroit and Philadelphia you would see in one man's order 15,000 pounds of this, and 12,000 pounds of that! And now the experimental stage of growing sweet pea seed is past with them. Soil being all right, they have experimented with the season. This year's crop was planted in December, but the next crop will probably go in as early as October, for this will bring the vines along so that they will be ready to bloom as soon as the rains cease, which will be about May 1, and they will seed early, the earlier the better. The coolness of the California nights is very favorable for this flower. They are not cramped for room, and therefore they plant in rows from three to four feet wide, with two seeds dropped every fifteen inches or so like corn in a hill. With a reputation for the most reliable vegetable seeds, they are now more anxious to supply sweet peas at their very best than the seed house or the floral public are to get them.

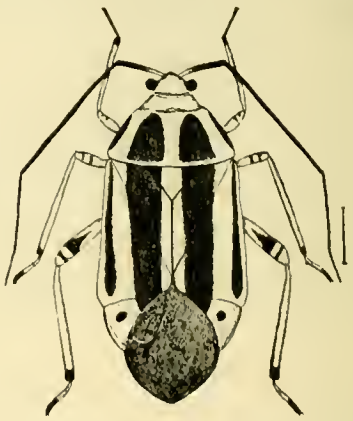
In my next chapter I want to stand impartially between the seedsman and the grower, plainly setting forth, what I have already said to the growers in person, the next hundred tons of sweet peas should be in quality and on the other hand setting before the seedsman his part of the problem, in which he can help the grower, or in other words suggesting how the seedsman can discourage the efforts that I know the growers are disposed to make in improving their seed stock and in severe roguing, by imagining that the large acreage means another drop on bottom prices, when it may mean, what I have seen on this visit, a roguing out of half the vines to make the stock pure. We are going to drop the common sweet peas out, and the improved sorts are now brought up to such form and size and delicate colorings that every year now will demand a severity of roguing that heretofore has been unknown. These fine flowers do not hold themselves up to their high types, but our growers will hold them up if our seedsmen will fairly consider the situation and discuss prices not according to the apparent average, but according to the high class of work which will be put on them. This year's California crop will send out a good deal of cheap seed, for it will take another year to get sufficient stocks of some of the best; but the growers I have visited are ready for thorough work, with expert hands to do it.

I for one have no patience with the idea that sweet peas are just now a "fad;" cheap seed will soon make the "fad" a short-lived one. But a permanent era of thorough work on this flower is at hand. A growing trade of the better class is rapidly showing up. I can promise every lover of this flower the finest seeds of the finest sorts, if all together, amateur and florist and seedsman, will show their appreciation of the work which the growers are now ready to put on it.

I do not want to convey the impression that the entire acreage of all the growers is this year in all respects satisfactory. Here and there they have unwittingly planted a deteriorated seed stock, not knowing how rapidly the highly developed varieties run back by the inbreeding which is peculiar to the sweet pea. It is an advantage for some flowers to cross fertilize naturally with each other, for, while it produces a mixed blood, it doubtless gives continual vigor to the plant stock; but left to itself the sweet pea is nothing but a natural inbreeder, each blossom being independent and shedding its pollen at a very early stage. To the grower this means that he must take the greatest pains in saving his seed stock. Now and then I saw an acre and asked "What was this planted for?" "It was sent by so and so as Purple Prince to be grown for them." But it had been allowed to run back till it had ceased to be Purple Prince. The Countess of Radnor, so delicate in its beautiful lavender shade, gravitates rapidly back to a reddish mauve and then comes out like its inferior parent stock, The Queen. Eckford has been ten and fifteen years in bringing his beautiful varieties up to their magnificent type; but if left to inbreed they are lost before we know it. If a seed house sends its own stock to be grown that is their lookout. If the seed house wants a guarantee on the grower's stock they must find out whether the grower has an intelligent idea of the nature of this flower and has sharp eyes and expert hands directing this branch of seed growing. The growers now are alive to the situation. If anybody wants such varieties as Painted Lady, Light Blue and Purple, Dark Striped Purple, Crown Princess of Prussia, Common White, Common Scarlet, etc., they can be grown by the ton with as little care as vetches, for they are simply old original sorts with the persistent plebeian vigor of undeveloped flowers. They are the weeds of the improved sweet pea. I came away with the assurance that the California growers are now ready to grow from the truest seed stock and supply us with the best varieties, and their disinterested cordiality is such that nobody need "kick" if for another year everything is not just right, for they will strain every nerve to make every pound of seed hereafter what it should be. I anticipate the most pleasant and uninterrupted correspondence with them discussing every variety, which on my part will be simply a disinterested enthusiasm for this flower.

A word in closing about the two new American varieties, the Emily Henderson and the American Belle. There will be some complaint again this year about the germinating quality of the former. I find on returning home that of the several plantings of different stocks of this variety it still germinates poorly. I saw the same thing in California. But I still have great faith in it. I saw acres of it that were in splendid condition, and that left no question of its merit as a vigorous white. I think in a year or two it will do as well as any variety. It is impossible to see why the seed of it that is now being grown does not promise as well as any other.

The American Belle sported last year, but the seed this year, much to the surprise of the growers, produces a very fine strain of the Blanche Ferry. Such vines as do come true to the American Belle do so from the very start, but only a few of them. It will require more time to fix the new type so as to hold. California bids fair to give us some fine new sorts, but they will hereafter go slower.



W. T. HUTCHINS.

A New Greenhouse Pest.

The last of April this spring we received some insects from the superintendent of the grounds of the Detroit Water Works, with the following letter accompanying them.

"DEAR SIR: Early last season we were very much troubled with insects like the enclosed. They attacked geraniums first and we came very near losing our entire stock, although by liberal use of fir-tree oil and tobacco juice, we finally got the better of the pest. Now it has got into our greenhouses. As it is very destructive and different from anything we have ever been bothered with I take the liberty of asking you if you are acquainted with the creature. They seem to sting and poison the leaves like the coleus and heliotrope I send you. Although they resemble the firefly, I do not think they are as we have never noticed them evenings when fireflies are apt to show themselves." E. A. SCRIBNER.

This is still another departure for the quite well known yellow lined leaf bug, *Pœcilocapsus lineatus* Dr. Lintner has

Yellow lined leaf bug much enlarged with a line on the right showing the natural size. The bug is a light yellow where the drawing shows white.

reported the same insect as nearly destroying a bed of dahlias for a New York florist, and he also records their work on such plants as morning glory, phlox, chrysanthemums, pinks, geraniums, day lily, sweet pea, burning bush, soap-wort and snapdragon. The bug is perhaps best known on currant bushes where it often punctures the leaves so that they turn yellow, wither, and drop off in early summer. It is also very abundant on tansy, mint, pigweed, and plantain at times, but these plants we can well spare.

Including all these plants, and those mentioned in the letter, we see that the bug is a very general feeder and one that should be known and watched. If at any time it is found outside, care should be used not to carry it inside the greenhouse in any form, as it may produce sad havoc. The bug breeds on the plants where feeding, and the shy young wingless bugs, much like the older ones except smaller, may be easily overlooked in transferring.

In reply to Mr. Scribner's letter, kerosene emulsion at the rate of one part kerosene in every fourteen was recommended, though rather hesitatingly for fear it might injure some of the more tender plants. A reply from him a few days ago stated that the emulsion had proved entirely satisfactory and the greenhouse was practically cleared of the bugs.

Agric. College, Mich. G. C. DAVIS.

ILLUSTRATION No 2.

ARRANGEMENT OF FLOWERS.

New York.

There was a good demand for flowers on Monday and Tuesday, but on Wednesday, Decoration Day, nothing was doing. The 34th street market was a very lively place early on Tuesday. There was lots of stock and it sold briskly, particularly the more showy grades such as pæonics and lilies. Outdoor stock did not figure as it has in previous years, as the rain of the past week destroyed many of the flowers that usually help to fill in on Decoration Day. This contributed to make a better demand than would otherwise have been experienced for roses and carnations, and the wholesale houses were kept quite busy the first two days, but in general the supply was fully equal to the demand.

Roses found a ready sale at a slight advance over prices of last week when of acceptable quality, but there was an unusual lot of miserable stuff sent in, covered with mildew and in bad shape generally, which was sold with difficulty at rubbish prices and that was all it was worth. American Beauties were quite plentiful and sold at from $3 to $20 per hundred according to quality. Outdoor Jacqs began to come in on Monday and brought from $3 to $4, while Meteors went as high as $8 if clean and good. Carnations, of which there was a good supply, found an easy outlet at good prices, running all the way from $1 to $4 per hundred according to variety and quality. On an average carnations were of better quality than is usual at this season. After the early rush on Tuesday trade came to a standstill and there it remains ever since. The supply of flowers is not heavy, the dark cool weather holding it back, but a day or two of sunshine will bring us round to ordinary summer conditions.

The retailers did not seem to be generally busy. Some say that they had a fair Decoration Day trade but none claim that there was any increase over last year. Those in the immediate vicinity of the cemeteries were naturally kept quite busy. Much of their trade, however, was in plants and many of them complain that this branch although brisk was not satisfactory on account of the prevailing low prices, which are fully one-third lower than last year. The retail trade no doubt suffered considerable on account of the rainy weather which prevailed previous to the holiday.

Wm. H. Rand has left the employ of Aug. Rolker & Sons.

Boston.

Decoration Day trade was unexpectedly good. Prices went up into the steep figures on many things but in spite of this everything was sold out clean. Some of the growers hit it just right on astilbe, stocks and such flowers and got better than Easter figures for it. To look at the store windows and even the street fakirs' stands one might almost be persuaded that the bouquet era had returned. Bouquets were all the go and it mattered but little what they were made of. Deutzia, weigelia, rhododendrons and some spiræas were the main stock of outdoor supply. There were a few lilacs and poet's narcissus which came from somewhere up north and gardenias which came from far south, but these cut no figure. Lily of the valley was very scarce and on roses and carnations prices were trebled several days beforehand and they remained there without a break until the last. Everybody seems well satisfied with the results of the flower trade except some of the out of town people who had to get carnations from the city and felt pretty sore over having to pay three and four dollars per hundred for pretty slim looking stock. Dried and artificial flower designs did not seem to sell as well as usual and some dealers had quite a stock left on their hands.

This has been a busy season at the Arnold Arboretum. Mr. Dawson estimates that no less than 75,000 or 80,000 shrubs have been planted out this spring. The new study grounds where a single specimen of each species and variety will be planted each in its own botanical order for the purpose of study and comparison are being rapidly laid out. The beds are twelve feet wide and nearly eight hundred feet long each, and would make a total length of about three miles if joined end to end.

The results of Prof. Sargent's trip to Japan are beginning to show now in the immense number of young trees and shrubs produced from seeds collected by him at that time. Of azaleas alone there are about 20,000 seedlings comprising a great many species and forms, some of which have not yet been identified as ever before in cultivation. It is confidently expected that a race of hardy Azalea Indica will be obtained, for these seeds were collected on high mountains where the climate is as cold as prevails here, the only difference being that they have more snow there. The Azalea mollis, which is perfectly hardy, came from the same districts.

Mr. Dawson calls attention to an interesting instance of the value of grafting where several plants from seed of the Oregon larch are growing side by side with specimens of the same, grafted on the Japan larch (Larix leptolepis) with scions from the former, and the grafted trees although six years younger are already fully twice the height of the original and of much finer form.

The fall blooming Astilbe japonica which excited so much interest last year has proved perfectly hardy and is evidently constant in its peculiar period of blooming, as there is no indication of flower buds to be seen yet on the plants. It is a great acquisition. Deutzia parviflora, a pretty open flowered species with blooms of purest white, is held in high esteem by Mr. Dawson, who recommends it as a valuable sort for early forcing for cut flowers. A new pink flowered deutzia from Yunnan, China, is very attractive but is of doubtful hardiness north of Philadelphia.

At a recent meeting of the stockholders of the Gurney Hot Water Heater Co., of Boston, Mass., it was voted that the name of the Company be changed to the Gurney Heater Manufacturing Co., instead of as heretofore the Gurney Hot Water Heater Co. The company therefore, will on and after the first of June be known under the title of the Gurney Heater Manufacturing Co. The officers of the company are, Edward Gurney, President; John A. Fisb, Vice-President; John M. Paisley, Treasurer, and Wm. T. Isaac, Secretary. The company state that as they have added to their list of manufactures steam boilers and steam radiation, and inasmuch as the former designation of the company had limited its apparent operations to water heating apparatus, they decided to change its name slightly as above, in order to specify without radical alteration more fully and broadly the field of its future operations.

Cincinnati.

B. P. Critchell & Co., one of the oldest florist firms in our city, made an assignment on May 31st to Mr. Chas. E. Brown. The liabilities are said to be about $20,000, and the assets are not yet known. Dull trade is given as the cause of failure. Mr. Critchell has been in business here for some thirty years and is one of the best known men in the trade in this city. It is thought that he will yet be able to adjust all claims. The appraisers appointed are Messrs. Frank Pentland of Lockland, O., and T. W. Hardesty and E. G. Gillett of Cincinnati. The appraisers began work Monday, June 4.

Mr. John Bertermann, of Bertermann

Bros., Indianapolis, made us a call last Monday, having been called to Cincinnati suddenly on account of the serious illness of a brother-in-law.

Mr. John Lodder of Hamilton is also in the city. E. G. GILLETT.

Philadelphia.

Even scribes are not infallible; they make mistakes just like other people. Last week one of them would have Mr. Metcalf's establishment in Norristown, down on the banks of the river, when it is up in the town. It was a large culvert that passes underneath his place that burst and caused the damage and not an overflow of the river.

A meeting of the committee of arrangements having in hand the matter of the entertainment of the members of the S. A. F. in August next, was held at the club room Saturday evening last. Everything seems to be going along smoothly. The business of the convention is first kept in mind and nothing will be done that will interfere with it in any way. The hotel accommodation committee are actively at work, and before long will have a list of hotels and cottages to suit all tastes. The business at Atlantic City, where a number of hotels and cottages keep open all the year round, is reported to have been very good the past winter, and the indications are that the coming summer will probably be a record breaker. Mr. John Burton has been down a few days this week sampling the salt air and trying the fishing, in which sport he ranks second only to Mr. E. Asmus.

The cut flowers now coming in, particularly the roses, are poor and prices have dropped a trifle. Mermets, Brides and La France are now $4 per 100 and the smaller stock such as Perles, Mme. Cusins, Niphetos, etc., $2 to $3. Kaiserins are now in demand at $5 to $6.

It would seem as if there will be no scarcity of summer roses, as quite a number of the growers have houses planted with stock for summer cutting, the varieties being mostly La France and Marie Guillot. Asters are also being planted inside and produce very fine flowers when grown in this way. There was a good demand for such stock last summer.

The chrysanthemum men are also busy and if all the houses now being started do well there will be an abundance of the Autumn Queen. While speaking of this flower it might be well to call the attention of the growers to the fall exhibition of the Horticultural Society at the Academy of Music. This will be away ahead of anything the society has done heretofore and all the local growers will need to do their very best, as the competition will not be confined to this city. Efforts will be made to get the best stock from all the large floral centers, it having been demonstrated that the chrysanthemum will carry long distances in perfect order if packed properly. We believe the day for growing large plants for exhibition is nearly past. Large vases of specimen blooms are much more effective than large plants. The latter are a great source of trouble all throughout their existence; many little things may happen which will render them unfit for exhibition, and finally if they should attain perfection, they always become more or less damaged and sometimes entirely ruined in transportation.

Some of the palm men are complaining, saying there is not near the demand for palms that there was last year. The auction sales have not been up to expectations which is very likely accounted for by the bad weather which caused postponement and subsequent falling off in attendance.

Mr. Harry Heacock, who has gone back for a time to his friends in Pittsburg, was the recipient of a farewell dinner last Monday evening given in his honor by his friends in the retail business. Although not long a resident of this city Mr. Heacock has made friends of all he met. In his dealings with the trade his manners have been exceedingly courteous, nothing seemed to be a trouble to him, he would get what was wanted it it was in the wood. So to show their appreciation of his worth this little entertainment was given. There were present besides Mr. Harry Heacock, Mr. Jos. Heacock, Messrs. Thos. Cartledge and his son Bart, Charles Kahlert, George Thomas, Eugene Weiss, Harry Jones, Geo. Craig, Geo. McLean, Robert Crawford, M. Rice, Geo. Rauch, Henry Bauer, L. B. M. Goff and Robert Kift. After the coffee and cigars had been reached there were informal speeches and words of regret at the parting of their friend and the hope expressed that he would be back before long. The party broke up at a late hour with singing of Auld Lang Syne.

The bowlers are having a great time in their practice games and there are many surprises. The big four are, well, they are not suited and some dark horses are coming to the front. K.

Chicago.

At a meeting of the Board of Commissioners of Lincoln Park held last Thursday evening, Supt. Pettigrew was formally removed and Mr. Horace C. Alexander was appointed his successor. No charges whatever were made against Mr. Pettigrew, and the board asked him to remain (under full salary) for another month in order that he might instruct the new superintendent in his duties. Mr. Alexander is 41 years of age and is a member of an engineering firm in this city. He has never before held any public position of any prominence, and is but little known, even in the engineering world. The salary of the new superintendent will be only $3,000 a year, though Mr. Pettigrew received $3,600.

A daily paper prints a list of Mr. Alexander's backers, but among them does not appear the name of any very prominent citizen and the majority of them are practically unknown to the general public. In last Friday morning's *Herald* the supervisors of the North Town are reported to have stated that they will seriously cut down the appropriations for Lincoln Park the ensuing term. The storm of protest against the action of the commissioners in removing Supt. Pettigrew is loud and long and every daily paper in the city criticises the board sharply. The president of the board is now finding out that he cannot execute the behests of Gov. Altgeld without sharing some of the odium that attaches to his actions. Several of the dailies are scoring him unmercifully in their editorial columns.

Mr. Pettigrew has not yet fully decided as to his future movements. He has several very flattering offers under consideration, and will probably make a decision before the end of next week. It is significant that those who are bidding for his services offer better salaries than he received as superintendent of Lincoln Park, and a curious point in connection therewith is that one offer is extended mainly on account of his ability in engineering work.

The forthcoming supper of the Florist Club (June 14) promises to be an unusually enjoyable event. We understand that Mr. O. P. Bassett intends to contribute some extras that will be decidedly acceptable on such an occasion. The intellectual treat will also be of a high order, as some of the best thinkers in the club will discuss some very live issues from their respective standpoints. Supper tickets will be only $1 so that the expense need not deter anyone from attending.

The stock of cut flowers for Decoration Day was considerably short of the demand, at least for the three days preceding, Decoration Day proper being very quiet with little demand. The exceedingly heavy demand was for out-going shipments on Monday and Tuesday. Owing to the great scarcity of out-door bloom of all kinds, the country dealers were compelled to draw on greenhouse grown stock for the bulk of their supply. Many orders had to be cut short, while a great number were refused altogether.

As might be expected, prices were maintained at the top notch, and as regards the smaller varieties of roses better prices were realized than either at Christmas or Easter. Carnations too ruled at Christmas prices and although a larger cut was sent in than was looked for the supply was far short of demand. From the growers' stand-point therefore Decoration Day was the biggest kind of success, and naturally the wholesale dealers too reaped a good harvest, a number of the latter claiming larger sales than at any former season.

But there is much dissatisfaction in retail circles. Extreme fluctuations in prices are always hurtful to the business. At Christmas or Easter the flower buyer has learned to look for a sharp advance and if kept within reason little complaint is made. But when prices double or treble at this season of the year the retailer must be prepared for trouble. The home demand on the whole was fairly good, but only small profits were realized, for the dealer who kept in view the importance of holding his patronage had to sell on a close margin. Bitter experience has taught him that the buyers cry of "extortionate prices" is death to business. Let the flower buyer once get the notion in his head that he is "held up" at holiday times and he will fight shy of the flower store for months after.

The high prices had the effect of driving the fakir off the streets almost entirely. But if the fakir in cut flowers was banished the fakir in plants was in high feather. These fairly swarmed around the entrances to all our cemeteries. The business in plants was however not very large as the weather was raw and chilly.

The scarcity of stock and consequent high prices continued throughout the week. On Monday of this week, however, the market opened much weaker. A few days of warm weather brought out an increased supply and this with a decided falling off in shipping demand caused at once a drop in prices. Pæonies particularly are received by the wagon load and threaten to become a bad glut for a week or ten days. The bulk of the supply is received from local points, the average quality being much poorer than last season.

The widow of the late John C. Moninger has disposed of her interest in the John C. Moninger Co. to Messrs. E. F. Kurowski and N. J. Rupp, who now fully control the company. Both have been connected with the firm for many years and there will be no change in the management, as the business has been really conducted by them ever since Mr. Moninger's death.

ILLUSTRATION No. 3.

ARRANGEMENT OF FLOWERS.

Washington.

Although the weather was not encouraging Memorial Day was generally observed by citizens and veterans alike. The interest centered, as it always does, at Arlington. At the tomb of the unknown, where the decorations are more elaborate than any other, the top was draped with a large flag. The base of the monument was hidden beneath a bank of roses, daisies and kalmia flowers with bunches of nymphæas, pæonias and large magnolias strewn here and there. From the four corner posts were festoons of kalmia leaves. Resting on the front of the monument was a large wreath of pink pæonias, dark red roses, stephanotis and Deutzia crenata fl. pl. with a back of asparagus; this bore a card from the Executive Mansion. Above this was a 5 pointed star of callas and candidum lilies. Resting against one corner was a handsome wreath of nymphæas, carnations and kalmia flowers on a back ground of ferns, bearing the card of Gen. John A. Logan's Woman's Aid Society No. 1. Against the opposite corner stood a scroll of cape flowers with corners of pink sweet peas and roses. Resting against either end of the monument was a large wreath of pink pæonias and roses with a back of laurel and ferns.

The resting place ot General Sheridan was beautifully decorated with a headquarters' flag of red and white cape flowers, from "Loyal Legion"; and by a saddle of red and pink roses, the stirrup straps of kalmia flowers and the stirrup of purple chenille, and a G. A. R. badge of immortelles. Resting on the base of the shaft were three placques, two of pink roses and one of white and pink sweet peas.

The grave of Admiral Porter was strewn with white and pink flowers. There was a large anchor of pink roses and kalmia flowers resting on a background of kalmia leaves and asparagus. At either side of the grave was a wreath of white cape flowers with the word "Porter" in purple immortelles.

Surgeon Gen. Baxter's grave, which is covered with growing ivy, was strewn with nymphæas, magnolias, roses, iris, and pæonias.

Gen. Crook's magnificent monument was handsomely decorated. Resting against the front of the base was a fine wreath of pink roses, callas, Harrisii, candidum and carnations; adiantum and ivy leaves formed a back ground. On the opposite side was a cross of ivy leaves on which rested a crown of small helianthus flowers; this was from the Legion of Loyal Women.

A splendid floral tribute rested on the grave of Gen. Wm. B. Hazen, bearing the inscription "Forty Rounds."

The grave of Maj. Gen. Rufus Ingalls was decked with an elegant spread of white and pink roses, from Lafayette Post No. 140, of New York. At the head of the grave and resting against the shaft was a handsome wreath of white flowers, mostly Harrisii and carnations. At the head of each grave (numbering 16,800) was a small flag and a bunch of flowers.

At the Soldiers' Home there were 6,500 graves to be decorated in the same way. The tomb of Gen. John A. Logan at Soldiers' Home was beautifully decorated. Over the door was a background and the name of "John A. Logan," entirely of laurels. Inside the walls were lined with beautiful floral pieces and the casket covered with harps, hearts and wreaths and many other artistic tributes in immortelles, roses, laurel and ivy. These offerings to the memory of the great volunteer general had been arranged with artistic effect by Mrs. Electa E. Smith and Mrs. Caroline Nye.

From the tomb of Gen. Logan the crowd went to the monument of Gen. John C. Kelton, late governor of the Soldiers' Home, which was unveiled with impressive ceremonies and handsomely decorated with flags and flowers both loose and in designs.

Business with the florists was brisk during the first part of the week and until after Decoration Day. The demand for designs seems to have materially increased this year and more of them worked in natural flowers. REYNOLDS.

St. Louis.

Decoration Day trade was very good, much better in fact than anyone had hoped for; stock was scarce, and this made the marked improvement. No advance in prices was noted, but everything was cleaned out. The shortness of stock has been noted for the last week, and is owing to the remarkably cool nights prevailing for this season of the year, many having to start the fires going again. Decoration Day, which heretofore has not been looked upon as anything much out of the ordinary, seems to be gaining in importance in regard to the flower trade.

The Ayers Floral Co. has taken possession of the store formerly occupied by the Pechman Floral Co., which they succeed. This gives them two stores in the "West End."

Wm. Hucke of Belleville is having a three-quarter span rose house 18½x82 erected by Thomson, Anderson & Kennedy; the benches are to be of the shallow solid bed type, with steam pipes passing underneath, to afford bottom heat. These will be the first tried in the West on this plan, and the workings will be watched with interest. He is also changing his boiler, putting in a steel one in place of the cast iron sectional that he has been using.

Thompson, Anderson & Kennedy, the horticultural builders, narrowly escaped being burned out one night last week, when fire was discovered in the cellar. The cause was spontaneous combustion, and originated in a heap of waste which the painters carelessly left lying in a corner. Fortunately it was noted about 9 o'clock as work was being stopped for the night, and extinguished without any trouble.

The Kirkwood Improvement Association held a spring flower show recently in connection with the maypole festivities, which was very creditable; prizes, which consisted of merely a blue ribbon, and honor, were offered for various classes, such as best table of flowers and plants, best collection of house plants and so forth. Mr. D. S. Brown showed a fine table of plants and flowers, containing specimens of marantas, crotons, pandanus, hydrangeas, anthurium, cannas, cypripediums, and as a center piece a fine specimen of cattleya, the plants all being clean and healthy. He also made a group of palms in the center of the hall. Mrs. Murtrett showed a table tastefully arranged, the plants being principally begonias, the cut flowers consisting of syringa, hybrid roses, lemon lily and other outdoor blooms, the cloth where it fell from the table to the floor, being decorated with evergreens. Tables were also arranged by Mrs. Mermod, Luther Armstrong and Robert F. Tesson. A large load of plants were sent by the Michel Plant & Bulb Co., which were arranged in a group, and towards the end of the evening auctioned off, the proceeds being donated to the association. The affair wound up in a dance for the young people, and was a pronounced success in every respect. R. F. T.

Madison, N. J.

Madison is one of the prettiest towns in the vicinity of New York. Large well kept estates with fine gardens and lawns and other evidences of comfort and refinement are seen on every side. More notable however is its prominence as a rose growing section. Rose growing is in fact the principal industry of the town. With a total population of two thousand five hundred there are fifty-three establishments of greater or less extent which consign flowers to the New York market, and the little railroad station at times is half buried in flower boxes going and returning. The business at Madison never stands still. New concerns are constantly springing up, old ones continually adding to their extent. Even under the adverse conditions of the present season many growers are preparing to increase their glass area.

An establishment which has attained unsought prominence recently is that of Mrs. R. B. Holmes. A romancing lady reporter with a lively imagination called there and "wrote up" the place for a New York daily with the usual result. Her astounding tales of the enormous quantities of violets picked here daily and the resultant wealth to the enterprising proprietor set ambitious womankind half crazy, and upon Mrs. Holmes was imposed the task of replying to some two hundred anxious letters of enquiry from all over the country. Although violets are grown here to some extent yet the main crop is, as everywhere else in Madison, roses. A promising sport from American Beauty has appeared here and is being watched with interest. Two large houses just erected under the supervision of a local builder are in bad shape, and appear to be in danger of collapse. They will require considerable remodelling. Experience is a great teacher; beware of the "local builder" when you erect greenhouses.

Calling at Mr. T. J. Slaughter's one finds the houses which were recently destroyed by fire fully replaced and young stock all planted. Comfortably posing in the barn door, peacefully enjoying the balmy spring breezes, the well built figure of Mr. S., Jr., looms up, but it is a long step down to the ground, an overexertion not to be thought of, so nothing is left for the visitor to do but to pilot himself through the houses as best he may and to regret the absence of the genial proprietor.

L. M. Noe does not propose to let the grass grow under his feet. That he raises roses for profit and not for fun is plain in every feature of his big place. American Beauty he pronounces the most profitable rose in existence, and one is not inclined to question his sincerity after seeing the perfection to which this variety is grown here, eight thousand plants all told, a veritable forest. Bridesmaid comes next to Beauty in Mr. Noe's estimation. He believes in giving Beauties all the water they can take in summer, then easing up on quantity when he begins to mulch in the fall. A bucket of this Madison water stands in the potting shed. The visitor refreshes himself with a draught of it from a bright tin dipper and unhesitatingly pronounces it excellent for rose growing purposes.

Beauty and Bridesmaid are also the favorites with Mr. Edgar Hopping. He gives it as his experience that Bridesmaid and Bride are good for one dollar a hundred more than Mermet the season through. A new house just complete is planted with Bridesmaid, and another for American Beauty is soon to be added.

J. D. Burnett is a successful grower, and one of the boys as well. He evidently believes in Mermet and her offspring, for Mermet, Bride and Bridesmaid are the principal varieties under cultivation here. Mr. Burnett looks for Bridesmaid to improve steadily each year in strength and vigor and will plant it more extensively for next season. One more house 180 feet long will be the extent of his building operations this spring.

T. W. Stemmler has begun work on the erection of a range of five new houses. This establishment is built on a side hill with a fine exposure, and roses in variety are grown, Perle des Jardins being apparently one of the best paying crops. They have borne very heavily the past season.

St. Paul, Minn.

Decoration Day trade went far ahead of all expectations, and the demand for flowers was unparalleled. Everything sold, from snowballs to roses, and the demand was principally, for the cheaper flowers, still roses, carnations, sweet peas, jasmine, etc., sold readily at advanced prices. The cemeteries were strewn with flowers of every description, loose, in flat bouquets, in wreaths, crosses and numerous other designs.

Trade the rest of the week has been good and will undoubtedly continue so for two or three weeks, or until the graduation exercises are over at the schools.

The demand for plants for Decoration Day was unusually large and thousands were disposed of in this manner. Bedding out is nearly completed, nearly a month earlier than usual, and the florists are now putting their houses in shape for another season.

There will be an unusually fine lot of chrysanthemums grown here this season and as spring work is out of the way earlier than usual this season, there will be ample time for perfecting plans for a "mum" show this fall. If only our florist friends would see it in the proper light, they would not let the opportunity pass for a first-class chrysanthemum exhibition next November. Such an exhibition in creating a rivalry would stimulate the growers to do their best and as a result some fine plants would be produced. But the crowning benefit would be the stimulus given to trade by the exhibition itself. In order to create a desire for our goods we must advertise and display them, and what better adv. could the florist have than an exhibition where thousands of people would visit, and where thousands of the best plants would be shown? What creates the demand for Easter flowers more than the annual displays made by our florists?

Get together, brethren, put your shoulders to the wheel, and move on to higher ground. Create a demand for your goods and you will sell them. Don't stagnate, don't complain of hard times, ruinous competition, etc. Have a first-class chrysanthemum show, pull together, improve your stock and all work in unity, and you will be surprised at results.

The Oakland Cemetery maintains a small greenhouse of its own, growing a few thousand bedding and flowering plants annually. Mr. Nordquist, who has charge of the greenhouse, is quite an artist in his line and has some of the finest carpet beds, mounds, etc., in the city. The cemetery association also fills vases and plants beds for lot owners at reasonably rates, thus adding to its income quite a little annually. Some two or three years since, the association adopted the rule that no vases and no beds of plants would be watered or attended to except at additional cost unless plants for same were purchased from them, thus compelling lot owners to buy plants from them or to attend to the daily watering of them themselves. Such a rule, obnoxious to the lot owners, detestable from the florist's point of view, and narrow, mean and contemptible on the face of it, will in the end prove a boomerang to the cemetery and cause the association more damage than good. We are reminded of it most forcibly at this season, when so many say to the florists, "We would like to have you fill our vases at the cemetery, as your plants are finer, you have a better assortment, and your prices are more reasonable, but the rule in force precludes our ordering of you as we cannot go daily to water them, and cannot afford to pay to have it done." If department stores are a thorn in the side of our florist friends, what must the cemetery association be, when its object is to provide a resting place for the dead and not to engage in the merchandise business. Verily the bodies of true florists would turn over in their coffins if placed beneath such flowers. FELIX.

Buffalo.

Two weeks ago on Wednesday last we had a heavy rain and thunderstorm, and ever since it has done little else but rain; the few intermissions are not worth recording. It has soaked everything, and made the tempers of the greenhouse men very sour; that is those who are inclined to get fretty when "bis" don't go right. It has really been serious, and has put back planting a full week. But florists mustn't grumble, we have not lost all our spring work, as hundreds of farmers have, neither have we seen any hail yet to do any damage, as our brethren in Cleveland have.

The most noticable feature of Memorial day was the good demand for flowers and plants, and the difficulty to supply them. Our old standby lilac was gone, and valley was in the sere and yellow leaf, carnations and roses don't go far in cheap flowers, but there was a good demand for all there was of them at good prices. Many thousand plants were taken to the cemeteries in place of flowers. By a strange arrangement of the weather bureau it didn't rain on Decoration Day, which made everybody very busy. There was a greater assemblage of florists to be seen in Forest Lawn than can be ever got together at a club meeting, unless it be a free lunch.

Flowers of all kinds can be called scarce. The continued heavy rains have spoiled most everything outside, and the same cause has shortened up all supplies from inside. This has been an excellent year to learn those a lesson who heavily shaded their houses early in May and let the fires out during this prolonged wet cold spell. Thousands of fine geranium trusses have rotted, which would now be very useful and ornamental on the plants.

We are in the height of the planting out when we can get at it, and the business promises to be quite up to former years, with an expected increase for the many fine residences that did not exist a year ago. Veranda boxes and vases are as popular as ever.

Mr. W. Mott of Philadelphia is here, he is No. 47 since March 1, and there is yet a few to come. W. S.

Jenkintown, Pa.

Mr. Jos. Heacock has a model establishment here, comprising some 50,000 square feet of glass. Most of the plant is of modern construction, with all the latest improvements for heating, ventilating, etc. Roses are the great specialty of this place—a small house of carnations, another of adiantum and one of palms being the only other stock grown. At one time Mr. Heacock used to grow considerable valley, but has given that up, as he finds more money in roses, Mermets, Brides, and Bridesmaid, all standbys here; the Bridesmaid is held in great favor for its fine color and constancy. Testout has done well this winter with Mr. Heacock; far better than was expected, and a larger space will be devoted to it for the coming season. Wootton is another favorite here, and Meteor also does well and pays handsomely. One large house is devoted to Kaiserin for summer flowers. Brunners are very successfully grown, and a large space is devoted to them. At the time of your correspondent's visit one large house had been planted with it for next season, and other houses were being got ready for the same variety. Out of doors the most striking thing in the way of bloom at present is the field of pæonies. They make a great show, and come in good for cutting. Some four or five thousand blooms are disposed of every season, and many more could be supplied if wanted. Mr. Heacock is ably seconded in his labors by his foreman Mr. Adolph Fahrenwald, to whom much of the credit for the fine appearance and great reputation of this establishment is due. W.

Doylestown, Pa.

A rather serious fire occurred on the Smith place here recently, destroying a section of the greenhouse plant, which included the boiler houses and two greenhouses adjacent. Mr. John Andre, who is the tenant of these greenhouses, says the origin of the fire is a mystery, as the houses had no heat on at the time. He is inclined to think it the work of some incendiary. The greenhouses destroyed contained a crop of smilax that was to have been cut the next day, the loss on which Mr. Andre estimates at fully $500. He has given up his lease of the Smith place and will give his whole time hereafter to his own establishment.

Mr. S. Edward Paschall has moved to West Chester, where he has purchased the Chester *Record*, and will devote himself to its interests. His mushroom-growing barns have been secured by Mr. Andre for the coming season. The people in this neighborhood who make a specialty of growing the "King of Esculents" are now busy cleaning out the old beds and thoroughly cleaning and limewashing their houses preparatory to fall planting. In this neighborhood the first planting is usually made about the end of August, although some claim that they are to try it a little earlier this year in order to get the full benefit of the high prices in October. W.

OBITUARY.

THOMAS LOBB.

This veteran collector, to whom we are indebted for valuable introductions from the East Indies, died at an advanced age at his home in Cornwall, England, April 30 last. Mr. Lobb was engaged as a collector by the elder Mr. Veitch in 1840. During the twenty years he traveled for the Veitchs he visited various parts of northeastern India and lower Burmah, Borneo, Java and the Philippines. Among the orchids introduced by him are Vanda cœrulea, Aerides Fieldingii, Dendrobium infundibulum, etc.; he also introduced some of the first nepenthes cultivated in British gardens and the original Javanese rhododendrons. He was a most energetic collector, sending in more Indo-Malayan plants of merit than any other single collector. Personally a very modest and retiring man, he would say but little of his discoveries.

As a result of the exposure during his work, Mr. Lobb lost one of his legs, which caused him to settle down some years ago in his Cornish home, where he has lived very quietly since.

Died on May 24 at 10:25 p. m., Andrew Bassler, in the 71st year of his age. A native of Wurtemberg, Germany, Mr. B. was for many years a leading grower of cut flowers and plants near Catonsville, Baltimore county, Md.

News Notes.

WEST TROY, N. Y.—Isaac Gillett is building a new house 22x82.

ROCHELLE, ILL.—C. M. Taylor has started in the florist business here.

DAYTON, O.—A. L. Hale intends to soon build a range of houses for vegetable forcing.

SASSENHEIM, HOLLAND.—Mr. P. Vos, of P. Vos & Co., arrived home May 19 from his American trip.

HATBORO, PA.—Harry Weiss, formerly of Manheim street, Phila., is building a range of houses here.

SUMMIT, N. J.—Chas. H. Hagert is building a new rose house. The heating is by Thos. W. Weathered's Sons.

COLMA STATION, CAL.—Grallert & Co. have built two new houses 16x100 and have planted same with carnations.

LEONARD, PA.—J. H. Sharpless is building two large new houses. The Moninger Co., of Chicago, supplied the material.

LOWVILLE, N. Y.—Chas. E. Butts is putting up two 50-foot houses here and is going into business as a general florist.

DESMOINES, IA.—I. W. Lozier expects to add new glass this summer and rebuild his old houses. Business is fairly good considering the prevailing hard times.

WILMINGTON, N. C.—We are glad to report that spring trade has been very good. We have had no rain for six weeks and it has been hard on outdoor stuff.

ORANGE, N. J.—We are having a plague of the 17-year locusts in this section. The country is fairly alive and under some trees the ground is almost entirely covered with them.

LEXINGTON, MO.—J. P. Coen, Jr. has added three large new houses, two of them on the short-span-to-the-south principle, from material supplied by the Moninger Co., Chicago.

MIDDLETOWN, O.—Miss Caroline, daughter of Mr. Henry Behrens, the florist, was married May 17 to Mr. Nelson O. Selby. The number of guests was very large and the floral decorations were very elaborate.

ATLANTA, ILL.—C. A. Jones is building an addition 32 feet in length to his greenhouse. Trade has been better here this season than we anticipated. Trade seems to be one-third better than last year so far.

BEATRICE, NEB.—S. H. Dole & Sons are adding about 3,000 feet of glass to their plant and will also build a small up-town house and store. Trade has been quite satisfactory, notwithstanding the hard times.

MT. STERLING, KY.—The Mt. Sterling Floral Co. will give a chrysanthemum show this fall, the surplus receipts to be donated to the public library fund. Plants have been given to school children to grow for competition at the exhibition.

OGDEN, UTAH.—F. J. Hendershot has started in as a florist at 24th and Monroe streets. He has one house 20x100 completed and is now building another which will have under irrigation and drainage, both heated by hot water and with electric light.

PEORIA, ILL.—Decoration Day trade was excellent here. Plants of all kinds sold well and cut flowers went quickly at fair prices. Quality was good, but there was not half enough to meet the demand. More calls for designs and mixed cut flowers than at same date of any previous year. Spring trade opens well. Most all sales are for spot cash.

Expose the Rogues.

The article in last week's issue of the FLORIST on "Imperfect Von Sions" is timely, and hits the nail on the head. The sale of these Italian bulbs has done a great injury to the trade, and reputable importers should not offer them to their customers, because it hurts the business all round. Their only recommendation is their cheapness, and that is more in seeming than reality. In fact they are dear at any price. Of course, these defects in certain products are only found out after a while, but it is now some time since the weak points of the Italian stock were known, and it is but right that such should be given full publicity for the protection of the unwary and inexperienced. In this connection it may not be out of place to mention that getting the bulbs from Holland does not insure that Italian stock will not be sent. There are unscrupulous and unreliable dealers in Holland as elsewhere, and it takes some experience in the importing business to avoid the pitfalls. The safest course is to secure supplies through reputable concerns in this country.

Another instance of how an inferior grade of bulbs hurts the trade, is found in Lilium candidum. Although largely displaced by Harrisii and longiflorum there can be no doubt but that it was largely injured by the introduction of the cheap and inferior bulbs from the south of France, and it is only recently that florists are beginning to realize that candidum is after all a very useful and profitable lily if one can only get the genuine old fashioned stock. In fact, inferior stock of nearly all our forcing bulbs is being constantly offered, and because it looks cheap many people jump at it, and when the day of reckoning comes they are only too apt to condemn the whole bulb business, and give it up in disgust. In seeds and bulbs more than anything else the motto that should always be kept in mind is "get the best,—get it as low as you can; but get the best that can be got, even if it looks high at first blush."

G. C. WATSON.

THE Denver Florists' Society has issued an advance schedule of premiums for its second annual chrysanthemum show to be held Nov. 7 to 10. Copies may be had on application to Adam Kohankie, Sec'y, lock box 375, South Denver, Colo.

Buy a stock of these if you have not already done so, and plant them out for the decoration of your grounds and a stock next season. You will find it will sell them for you and be profitable. Nothing is so showy.

CANNAS.

WORLD'S FAIR BRONZE MEDAL SORTS,

AND A FEW OTHER EQUALLY GOOD AND SCARCE VARIETIES.

THE HIGHEST AWARDS AT CHICAGO, 1893.

We were awarded Nine Bronze Medals, and we received the only Bronze Medal given for the Largest and Best Collection Exhibited.

Our collection embraces only the finest sorts in commerce to-day. Our exhibit comprised over Four Thousand Plants, more than three times the quantity exhibited by all other exhibitors combined, and created an impression that will not soon be forgotten.

CHARLES HENDERSON.—We consider this variety for general use, on account of its compact, perfect habit of growth, large size of flower, habit of bloom, and brightness of color, by far the finest kind that has been introduced since Mme. Crozy. It is identical in habit of growth with Mme. Crozy, which is considered the standard of perfection at the present time, but is entirely distinct, the flower being of the brightest crimson; we consider the flowers, from test made, to be larger than Mme. Crozy, and the heads of bloom to be also larger. As a pot plant for spring sales, as the companion of Mme. Crozy, there had been no variety sent out that was at all equal to Mme. Crozy in general desirability until the introduction of this kind, and it will meet with a very large sale in consequence, and we think will outsell Mme. Crozy. This variety and Alphonse Bouvier are very similar in color, and while for effective bedding in masses in summer, Alphonse Bouvier will surpass it, Charles Henderson for general use will be found to be very much more satisfactory, particularly as a florists' plant for selling purposes, as for this purpose Bouvier is not desirable as it is a tall grower and does not flower freely nor quickly enough under glass. We believe that Charles Henderson, without question, will give more satisfaction to the trade generally than any other variety sent out up to this time, and we can recommend it very highly; no variety we have ever tested in our greenhouses has ever compared with it in any way, our plants being a solid mass of bloom. It was introduced last season for the first time, and was pre-eminently the finest introduction of the year. We believe it for outdoor bedding to be equal to Mme. Crozy; under glass we consider it superior; its dark, bright crimson color will undoubtedly insure it a wide distribution and ready sale, and it can be offered by every florist with the assurance that it will give unqualified satisfaction. A beautiful illustration, painted from nature, which shows how perfect and beautiful a flower it is, will be mailed free on application.

FLORENCE VAUGHAN.—This is the best yellow spotted Canna introduced up to this time; color, lemon yellow spotted with bright red. The size and form of the flower is by far the best that has been raised to date; it has been claimed for this variety that it was the best yellow in cultivation, but the scarlet markings on the petals detract from the brightness of the yellow, and while it is unquestionably the best mottled sort, it does not equal Capt. P. De Suzzoni as a yellow variety FOR BEDDING. It is a strong, robust grower, with flowers of the largest size with large heads, blooms freely, and for florists' sale will be very, very satisfactory Bronze Medal awarded for this at World's Fair, Chicago, 1893. Price, strong, pot grown plants, **$4.00 per doz.; $25.00 per 100.**

CAPTAIN P. DE SUZZONI.—The best yellow Canna for bedding introduced so far. It has almost as large a flower as Mme. Crozy, with a very large spike of bloom, and is slightly mottled with scarlet. The scarlet markings are such, however, that instead of detracting, as is usual with most of the yellow Cannas that have been so marked heretofore, it intensifies, if anything, the brilliancy of the yellow. It has a distinct habit of growth, the foliage very nearly approaching the banana. Bronze Medal awarded us for this at the World's Fair, Chicago, 1893.

EGANDALE.—Foliage dark maroon and green, very similar in coloring to the old Robusta Perfecta, although more erect in habit; very compact, throwing up numerous heads of bloom which rank with the best in quality, both in size of the heads and quality of the flower; color, bright cherry Will be particularly sought after, as it is undoubtedly the best dark-leaved sort at the present time for outdoor bedding. Bronze Medal awarded for this at World's Fair, Chicago, 1893.

J. D CABOS.—Dark greenish maroon colored foliage with a bronze metallic lustre; flowers bright orange apricot, sometimes brightened with a pinkish tinge; one of the most distinct of all Cannas, and one of the finest, being a fine grower and a very early, profuse, continuous bloomer. Flowers of the largest size and of a color that is very pleasing, and there is nothing similar One of the best all-round Cannas introduced to date. Bronze Medal awarded us for this at World's Fair, Chicago, 1893. **$2.50 per doz. only.**

PAUL BRUANT.—One of the freest blooming sorts of all, throwing flowers well above the foliage; the color is very distinct and conspicuous—an exceedingly brilliant orange-scarlet, satiny in texture, that lights up and seems to reflect the sunlight—an intense color. Large heads of flowers of the largest size; of dwarf habit. Bronze Medal awarded us for this at World's Fair, Chicago, 1893. **$2.50 per doz. only.**

COUNT HORACE DE CHOISEUL.—Very dwarf, with close compact habit and large sized flowers; beautiful deep carmine color; a fine pot-plant and a fine bedder, particularly valuable on account of its dwarf habit, beautiful color and good-sized flowers. Bronze Medal awarded us for this at World's Fair, Chicago, 1893.

PRESIDENT CARNOT.—Orange-scarlet suffused with pink; a beautiful color, good-sized heads with large flowers; foliage, brilliant chocolate-maroon; one of the finest dark-leaved sorts, distinct and good.

Price of the 6 preceding sorts, strong pot-grown plants, **$2.50 per dozen; $15.00 per 100.**

ALPHONSE BOUVIER.—This is the grandest Canna for bedding out of doors introduced up to this time. It is a very luxuriant grower, growing considerably taller than Mme. Crozy, throwing up flower-stems more freely than that variety. In good ground and under good cultivation the plant will grow eight feet It begins to bloom very early and is one continuous mass of crimson the entire season. The tips of the shoots are surmounted by immense clusters of bright crimson flowers of the very largest size, and nothing can exceed their brilliancy. It has a peculiar habit of drooping the flower-cluster a little as the second flowering shoot begins to push above the first, and the shoots flower two, three or more times, one after the other, a large plant in bloom sometimes having on it as many as thirty or forty of these large brilliant clusters of flowers. Grand is the only word that describes this variety. For general bedding purposes it surpasses Mme. Crozy. Upon being tried the past season this was questioned, but trial has convinced even the most skeptical that no other variety approached it for grandeur and effective ness when bedded in masses. As a pot-plant for greenhouse cultivation it is not so desirable on account of its taller growth. Bronze Medal awarded us for this at World's Fair, Chicago, 1893.

FRANCOIS CROZY.—This variety is identical with Mme. Crozy in habit and general style of growth, but the flowers are bright orange bordered with a narrow edge of gold, one of the most desirable shades that could be secured. The plants are somewhat more dwarf than Mme Crozy, and are fairly covered with flowers. Bronze Medal awarded us for this at World's Fair, Chicago, 1893.

MADAME CROZY.—Flowers flaming scarlet bordered with gold. This is now well known, and is still an ideal sort in every way. We have made a specialty of this for the past three seasons, and no plant we have ever sold has given such universal and unqualified satisfaction. In order to give an idea of the large size of these flowers, we had a painting made, showing the actual size of the flowers and their beautiful coloring; we will be pleased to send this free to any one who may not have received it; it is no exaggeration whatever, giving the actual size and the vivid and beautiful coloring of Mme. Crozy. When the large size of the flowers and the large heads of bloom are taken in connection with the freedom with which it blooms, it makes one of the most attractive plants for bedding that it is possible to conceive of Bronze Medal awarded us for this at World's Fair, Chicago, 1893.

PAUL MARQUANT.—One of the most distinct of all and one of the most beautiful. Those who have seen it in our houses and at the World's Fair have considered it preferable to any other variety, not excepting Mme. Crozy, on account of its beauty and profusion of bloom, and no variety throws so many flower stems as this. The individual flower is larger than any other, and the flower-spike very large, each flower standing out separately by itself. The flower is as fine as the finest Orchid. The color is very hard to describe to give any adequate idea of how beautiful a shade it is. It might be described as a bright salmon with a carmine tint. The flower has a silvery lustre, which glistens and lightens it up with a silvery sheen, making the salmon of the flower very brilliant. Some have described it as apricot—a shade that is so fashionable at the present time. For greenhouse culture it is one of the finest of all, as the growth is not so tall as the preceding sorts. Bronze Medal awarded us for this at World's Fair, Chicago, 1893.

STAR OF 1891.—More dwarf than Mme. Crozy and valuable on this account. A mass of scarlet when it blooms, but the individual flowers are not nearly as perfect as Mme. Crozy. It is an elegant pot-plant, and will bloom in the house in the winter splendidly, for which purpose it is admirably suited. Its attractiveness and ease of culture, certainty of doing well, etc., make it a plant a florist can recommend, knowing it will please the buyer every time.

GEOFFROY ST. HILAIRE.—Best dark-leaved Canna that can be offered cheap. Dark maroon colored leaves with a dark metallic or bronze lustre Flowers light salmon scarlet.

MADAME CROZY.—Flowers flaming scarlet bordered with gold. This is now well known, and is still an ideal sort in every way. We have made a specialty of this for the past three seasons, and no plant we have ever sold has given such universal and unqualified satisfaction. In order to give an idea of the large size of these flowers, we had a painting made, showing the actual size of the flowers and their beautiful coloring; we will be pleased to send this free to any one who may not have received it; it is no exaggeration whatever, giving the actual size and the vivid and beautiful coloring of Mme. Crozy. When the large size of the flowers and the large heads of bloom are taken in connection with the freedom with which it blooms, it makes one of the most attractive plants for bedding that it is possible to conceive of Bronze Medal awarded us for this at World's Fair, Chicago, 1893.

MISS SARAH HILL.—Carmine-crimson; borne in erect heads; of dwarf, compact habit, blooming very freely.

Price, strong pot grown plants, **$1.50 per dozen; $10.00 per 100.**

F. R. PIERSON COMPANY, Tarrytown-on-Hudson, N. Y.

Orders for less than one-half inch space not accepted.

Advertisements must reach us by Monday to secure insertion in the issue for the following Thursday.

Address THE AMERICAN FLORIST CO., Chicago.

ORGANIZATION is the order of the day and the action of the wholesale commission men in taking steps to form an organization through which they may better serve their mutual interests, is certainly wise. The meeting which they will hold at Atlantic City next August should be attended by every commission dealer in the country. Good invariably results from the bringing together in this way of those with mutual interests. Let no one imagine that such an organization will be inimical to the best interests of the whole trade. As regards "equalization of prices," while by united action something may be done to lessen the disastrous effects of the gluts that occur at times, no organization however strong can make it possible to equalize to any appreciable extent the prices of such perishable stock as flowers. So no one need fear that prices may be manipulated by the proposed organization, and surely much good may be accomplished in other directions. Would it not be of value for each member of the association to be advised daily of the condition of the market in the various large cities? This could be readily and economically done through the medium of such an association. Let each city report daily by wire at a stated hour to the secretary of the association, he to at once forward same to each of the other cities represented, this to be there manifolded and copies distributed to each member entitled to same; or he could wire direct to each if preferred. The expense of either method would be very little.

THE MOST RECENT PUBLICATION issued by the Missouri Botanical Garden is a monograph on North American species of Sagittaria and Lophotocarpus, by Jared G. Smith. It contains 38 pages of reading matter and 29 excellent plates, and gives minute descriptions of these variable and interesting aquatic plants. It is printed in advance from the sixth annual report of the Garden.

Seed Crop Report From Waterloo, Neb.

Our spring started in fully two weeks earlier than usual, with the land in excellent condition for plowing and planting. Corn, melons, squash and pumpkins were gotten into the ground as rapidly as possible and a good stand of everything was obtained.

On the night of May 19, we experienced a severe freeze that injured corn, potatoes, small grain and fruit, and which destroyed all vines that were out of the ground. Replanting was immediately made but in nearly all cases the seed has remained in the ground with no showing of germination up to date.

On the night of May 29, we had a small local shower that moistened the surface of the ground; it did not extend one-half an inch below the surface and did not reach the seed that had been planted. Still the rain that did fall although but little may do some good. Cucumber has not all been planted, the ground being too dry. Should an early frost come this fall the squash and pumpkin crop will be very light if not a total failure; much depends on the balance of the growing season.

The freeze referred to injured all corn but we note that it is coming up again and will not require general replanting. The stand in most cases is fairly good. The grasshoppers troubled us to quite an extent last season but from present indications it was nothing to be compared with the damage we will in all probability suffer this year. *Millions* of young grasshoppers can be seen now; never before in such numbers at this season of the year.

The acreage of sweet corn and vine seeds planted in Nebraska this year is not more than one-fourth of the area planted last season. Growers have learned a severe lesson in regard to the planting for surplus crops over and above the required quantities with which to fill contracts. They have discovered that the seed trade have no disposition to help them by taking surplus crops off their hands unless at a sacrifice of value which means loss to the grower; hence the caution used in planting excess acreage this season.

Taking into consideration the reduced acreage and the very unsatisfactory present condition of crops now existing, together with the far from promising future outlook, and it would seem as though prices must rate higher this coming fall than has been the case for several years past. GROWER.

A NEW RACE of dwarf sweet peas is hopefully predicted in the novelty lists o the near future.

THE TEXAS SEED CO. of Waco, Texas, is now in the hands of a trustee, who will close out the business. More particulars are expected later.

A NEW FEATURE of "Landscape" advertising consists of large white wooden letters placed flat on sloping grassy banks in view of passing trains. The use by seedsmen of large sign boards along leading suburban lines out of New York City is increasing.

Our buyers will visit Holland, Southern France and Bermuda during the month of June, and orders placed with us now will have most careful personal attention by them.

WINTER FLOWERS

With the present low prices of Bulbs and the increasing desire for flowers among people, a great deal more ought to be done in the Bulb line.

Ten Bulbs of one variety of Hyacinths or Tulips in a pan make desirable window decorations and give a big show for little money. Large quantities of these pans are disposed of in the Boston and New York markets throughout the winter and spring.

Fitted into pretty celluloid baskets or other receptacles and encircled by ribbon of appropriate color, they are great favorites in New York City as Easter gifts.

In nearly all the largest cities the parks have been planted with spring Bulbs, this should also be done in private gardens. Nothing is handsomer on the lawn than a well arranged bed of Hyacinths, Tulips or Crocus.

It is a favorable opportunity for Florists to drum up a trade in this line.

SEGERS BROTHERS,

ALTERNANTHERAS.
Red and Yellow, good size, $2.50 per 100.
McCREA & COLE, Battle Creek, Mich.

Cleveland.

Cool cloudy weather following several weeks of bright warm weather had the effect of shortening up all supplies for Decoration Day. There being very few outdoor flowers the greenhouses were called on almost entirely for the needed supply.

The call for flowers from out of town exceeded that of any former year, and the wholesale shipping trade was excellent. The greatest demand, as usual at this date, being for carnations, and as nearly all the crops were off, not one-half the orders could be filled. There were plenty of good roses to meet all demands, also some very fair tulips, daffodils and hyacinths from cold storage, but there was very little demand for bulb flowers, they do not catch the popular fancy after their season is over and it hardly pays for the trouble and additional cost to hold them over. L. F. D.

Surplus Stock 50,000 Roses

We still have above number in prime condition and want to dispose of same at once for cash. It will pay every florist to plant out one or two thousand of these Roses, the cut flowers will more than pay the cost.

For $20 we will Express you 1000 Roses in following sorts—quality and safe arrival guaranteed: Cl. de Lahanthe, Bride, Mermet, Perle, Schwartz, Devoniensis, Therese Levet, Niveus, Golden Gate, Papa Gontier, Dijon, White, Pink and Red La France, Meteor, Mrs Degraw, W. A. Richardson, Pradel, Christine de Noue, P. Krueger, Cels, Queens Scarlet. Outside of these have 50 more sorts; leave selection to us and we can furnish at same figures. Send your lists to be priced.

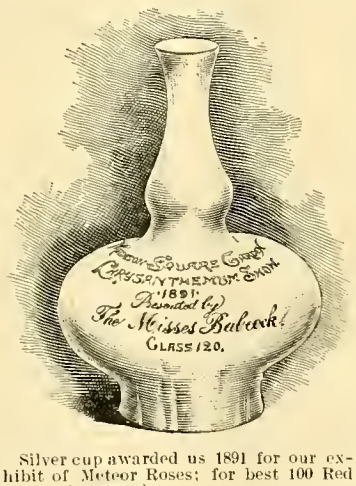
WINTER FLOWERING ROSES



We devote more than half of our greenhouses to the production of Winter Flowering Roses, and have the finest range of greenhouses in this country for that purpose; they contain every improvement in regard to durability and labor-saving appliances; the rafters and purlins are of wrought iron, securing very light roofs and extreme durability. The water is warmed in very cold weather before using by the exhaust steam from the steam-pump that supplies the houses with water; liquid manure is all pumped by steam, and everything to secure the highest development of our stock, and at the least expense, has been sought for and secured, and our new range of iron rose houses, covering two acres of ground, and **devoted exclusively to the production of cut roses,** are conceded by all who have examined them to be without question the finest range of greenhouses devoted to rose culture in the United States, and we believe, in consequence, we have exceptional facilities for supplying strong young healthy rose stock at the lowest possible prices. These houses are worth examination, as they are conceded to be model houses in every way. Visitors are always welcome.

AMERICAN BEAUTY.—The largest rose and the most vigorous growing by far among continuously blooming roses, throwing up very strong stems from the base of the plant, every shoot terminated with a single flower, which is of the largest size. Color, deep rose. In foliage and size of flower it resembles the large Hybrid Perpetual or Hardy class, and is similar to Magna Charta or Gloire de Paris. It is as fragrant as the most fragrant of Hardy roses, which, coupled with its vigor, large size and beautiful color, long stems and continuous bloom, places it at the head of Winter blooming roses. It requires skill and favorable conditions to flower it in perfection, but when successfully flowered no other rose approaches it for beauty or profit. 2¼-inch pots, **$10.00 per 100; $90.00 per 1000.**

MME. CAROLINE TESTOUT.—This rose has attracted more attention than any rose sent out since the American Beauty. It was the winner at the Madison Square Garden Chrysanthemum Show of the LANIER SILVER CUP for the best new seedling of European origin not exhibited previous to 1892, and it was constantly surrounded by an admiring group throughout the show. It is a Hybrid Tea, with a decided, though delicate tea fragrance. It is a very vigorous grower, throwing up heavy bottom shoots in profusion, and is also a remarkably free bloomer for so large and fine a rose, producing scarcely any blind wood. In form it is very similar to La France, and in size much larger. In color it is simply unequalled among pink roses, being of a wonderfully clear brilliant pink, of one solid tone, without shading of any kind. It needs no special treatment, and for a high class rose of easy culture, it is certainly unequalled. Large roses that can be cut in the half-blown state, like Beauty, are becoming yearly more fashionable and the popular taste seems to be growing in this direction; we have needed a good pink rose to meet this demand, and believe that Mme. Testout will fill the bill. Mr. Ernst Asmus says: "This is the best Hybrid Tea the French have ever sent out." Mr. W. W. Coles says: "I have grown many varieties of roses, but have never seen one with so many good qualities as the above. I shall be very much mistaken in my prediction if we do not find, within a few years, that there are a thousand Testouts grown for every hundred La France." Mr. Robt Craig says: "I want to tell you that's a nice thing. The color of Testout is its great point. In that respect it is far ahead of La France. It will keep in the cellar for three or four days, and as the color fades it keeps a pleasant shade." Growers, Retailers and Flower Buyers are alike enthusiastic in its praise, and in our opinion this rose is destined to win a high place and prove very profitable to the grower. First premium awarded us for this variety, N. Y. Chrysanthemum show, Fall, 1893. Price, 2¼-inch pots, **$8.00 per 100, $75.00 per 1000.**

Silver Cup awarded us for Meteor Roses, exhibited at Madison Square Garden, 1892, for best 25 Red Roses of any variety.

Silver cup awarded us 1891 for our exhibit of Meteor Roses; for best 100 Red Roses of any variety.

KAISERIN AUGUSTA VICTORIA.—A new rose of German origin that is attracting a great deal of attention and promises to be of great value. In color it is midway between Bride and Mme. Hoste, a delicate cream white. The buds are both larger and longer stemmed than those of Bride. The habit of the plant is singularly strong, vigorous and healthy; the flower is most deliciously fragrant. Winner of the Silver Cup offered by the F. R. Pierson Company, at the Madison Square Garden Chrysanthemum Show for the most promising forcing rose never before exhibited at a New York show. First premium New York Chrysanthemum Show, Fall, 1893, awarded us for this variety. Price, 2¼-inch pots, **$8.00 per 100; $75.00 per 1000.**

BRIDESMAID.—(Originated by Frank L. Moore.) This is the rose we have all been waiting for—*a Mermet whose color is constant* through all kinds of weather. Mermet has always been acknowledged as more nearly approaching perfection than any other pink rose, its one fault being its tendency to lose color in dark weather. In the *Bridesmaid* we have it with this one fault corrected, and every good trait unchanged. It is identical in form, habit of growth and freedom of bloom with its parent, and, unlike Waban, it never produces malformed buds. Many of the largest and most wide-awake growers about New York intend to discard Mermet and plant Bridesmaid in its place the coming season, and we believe results will prove their wisdom, as its uniform good color causes it to bring a correspondingly uniform good price, and hence makes it much more profitable. The past winter it has brought fifty per cent more than Mermet; when it is realized that it is fully as free of bloom, no more need be said on this point. We won *First Prize* two successive days at the Madison Square Garden Chrysanthemum Show, fall of 1892, for this variety. Mr. T. J. Slaughter, who has been a large and very successful grower of Mermet, voices the universal verdict when he says: "It gives me great pleasure to give the Bridesmaid my hearty recommendation; from my experience with it this year *I am convinced it will supersede the Mermet entirely*, owing to its better color and greater market value. I intend to give it all the room I can possibly spare. I think growers will go strong for it next year." 2¼-inch pots, **$8.00 per 100; $75.00 per 1000**

METEOR.—The finest crimson rose for winter blooming; very double and very dark velvety crimson scarlet, its only fault being a tendency to become black during the shortest days of winter, but when well grown it is not excelled; a superb variety. We grow this rose very largely, and won a Silver Cup at the Madison Square Garden Chrysanthemum Show, for the best twenty-five blooms, also both first and second prizes for the best twelve blooms. We are recognized as having the best stock about New York, and are headquarters for this variety. In 1893 we again received First Premium for our exhibit of Meteor at the New York Chrysanthemum Show, and also a **Bronze Medal at the world's Columbian Exposition in Chicago,** for our exhibit of this variety. 2¼-inch pots, **$6.00 per 100; $55.00 per 1000.**

SOUVENIR DE WOOTTON.—A very valuable scarlet-crimson, much like Jacqueminot in size and color; an easy variety to flower and has a delicious fragrance. Throws good stems, but frequently in clusters, in which case, by disbudding, the size of the flower is largely increased. The best crimson Winter-flowering rose at the present time **"for general use,"** all things considered. 2¼-inch pots, **$6.00 per 100; $55.00 per 1000.**

MME. CUSIN, PERLE, MERMET, NIPHETOS and BRIDE, $5 per 100; $45 per 1000.

F. R. PIERSON CO.,

TARRYTOWN-ON-HUDSON, N. Y.

Toronto.

Business this last week has not come up to what is generally expected during the last week in May, but the kind of weather that is being dealt out to us just now is not that which induces people to turn their attention to "the flowers that bloom in the spring, tra-la." The "oldest inhabitant" however is having a good time searching for precedents for so much cold, wet weather at this time of year; for my own part I don't believe he will find any. In some of the parks and gardens they are trying to do a little bedding out between the showers, but no great quantity has been put out yet and blanks have been left for coleus to be put in when the warm weather arrives, which to all appearances may be some time before August.

The chestnut and mountain ash trees, of which there are large numbers planted in the streets here, are in full bloom just now and the cool dull weather is allowing them to last in full beauty for a longer time than usual. I have come to the conclusion however that the horse chestnut is not a suitable tree for a general city street shade tree. The foliage is so dense that no grass will grow on the boulevards under it and it makes it too dark in houses near by, and in the fall it is an endless source of temptation to the small boy who prowls round with his pockets full of rocks. As a broad avenue tree however it is unsurpassed. I have in my mind's eye now an avenue, or public promenade rather, in Orleans, France, about three quarters of a mile long with 8 or 10 rows of chestnut trees with every alternate row of the "scarlet" variety. The effect is something immense when in full bloom.

E.

San Francisco.

The creditors of the firm of Carbone & Monti have to meet in court June 11th and present their claims. Carbone intends to start in business now in Ocean View.

It is rumored that a company of Chinese will open a retail store here soon.

The market is overstocked with stuff so that business is dull. M. Lynch is bringing in the finest sweet peas, and Portias. Dan Driscoll also brings in good roses and carnations.

Pittsburg.

The very inclement weather experienced this week has contributed somewhat to the dullness of trade. It has had the effect of shortening up the supply a great deal and for the past week it has not been equal to the demand. Cut flowers have advanced in price 100 per cent. All out door bloom has been affected by rain and hail and very small quantities have been received. Iris, pæonies, kalmias, and gardenias are in from the south but not in quantity. Bedding plants are of inferior quality but fetch fair prices. Good stuff is at a premium and will fetch more than profitable prices. Most all tender bedding plants that have been planted out will have to be replaced, as the cold rain and hail storm have completely destroyed them. Early tender vegetables have suffered the same way. The seeds have either rotted in the ground or been destroyed after germinating.

Pittsburg and vicinity will remember the last day of May for some time to come. About 5 p. m. we had a hail storm for nearly an hour; not large enough to do any damage to glass, but it stripped foliage from plants outside, and could have been shoveled up by the cart load.

The growers seem to be well satisfied with the season. Decoration Day plants were in great demand, but the plants were inferior quality.

Hartman Bros have no trouble with their stock, as it is first-class. It is handled in the market by Robert Faulk, who always get the top price.

John Bader also reports business satisfactory and stock mostly all sold. The only trouble he says is that he has not enough.

Randolph & McClements have all they can do to satisfy the demands of their customers, and report business as first-class.

A. M. & J. B. Murdoch have been doing a large business and have plenty ahead.

With Decoration Day and quite a demand for funeral work the florists have been kept busy and report flowers scarce. To-day (June 3) is fine and warm and will be welcomed by all after seventeen days of rain. A. J. E.

BUILDING.—Readers who contemplate building additional greenhouses, or remodelling old ones, this summer, will confer a favor by reporting their intentions to us. We are anxious to have as full a record as possible.

AMERICAN GROWN DUTCH BULBS.

To introduce my American grown Narcissus for forcing by florists I make the following special offer. *Bulbs ready now.*

	Per 100
NARCISSUS CAMPERNELLE, - -	$.75
DAFFODIL RUGILOBUS, - - -	1.50

I would like to correspond with any one desirous of going into the business of growing Dutch bulbs in America. I have a stock of 400,000, in 10 to 18 varieties.

South Carolina is the very best section of the U. S. for the growing of these bulbs. I have successfully demonstrated this, and can offer a splendid opening to a man with some capital and familiarity with horticultural work.

THE AMERICAN FLORIST CO.'S

DIRECTORY

AND

REFERENCE BOOK

FOR 1894

CONTAINS THE FOLLOWING:

1. The names and addresses of the Florists, Nurserymen and Seedsmen of the United States and Canada, the exact branch of the business each is engaged in being indicated.
2. A separate list of firms that issue catalogues, the space devoted to each branch of the business in each catalogue being also given.
3. A list of the names and addresses of superintendents of leading parks in the U. S. and Canada.
4. A list of the principal cemeteries of America at which the arts of the landscape gardener and florist are used in beautifying the grounds.
5. A complete, alphabetically arranged list of Roses in commerce in America, with class, habit of growth, date of introduction, name of introducer, and brief, accurate descriptions of the flower of each. Synonyms are also plainly given.
6. A complete, alphabetically arranged list of Chrysanthemums in commerce in America, with class, and brief, accurate description of each. Synonyms are noted and varieties that are very popular with American growers are designated by a star, and this year's introductions by a dagger.
7. A complete, alphabetically arranged list of the Carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each.
8. Seasonable Hints for the year, arranged in weeks, written by Mr. William Scott, and covering every detail of a general florist business. This is decidedly the most valuable contribution to the literature of the trade ever published. It is written in a plain, practical way, by a man who knows what he is talking about.
9. A historical sketch of the Society of American Florists from its organization to date, including officers for each year and lists of essays read at each meeting, with other information of interest.
10. A similar historical sketch of the American Association of Nurserymen.
11. A similar historical sketch of the American Carnation Society.
12. A similar historical sketch of the American Seed Trade Association.
13. Similar historical sketches of the Florists' Hail Association of America; of the National Chrysanthemum Society of America; of the Florists' Telegraph Delivery Association.
14. A complete list of all National and Local Trade Organizations, with names and addresses of principal officers, time and place of meetings, etc.
15. Statistics of Commercial Floriculture in the U. S. from the last census.
16. Statistics of the Nursery Industry in the U. S. from the last census.
17. Statistics of Seed Growing in the U. S. from the last census.
18. A list of Leading Horticultural Societies, with name and address of the Secretary of each.
19. Full information about Express and Postage rates on plants, shrubs, trees, seeds and bulbs.

No less than 270 pages of valuable reference matter in compact form, and all UP TO DATE.

PRICE $2.00 POSTPAID.

Crude Oil for Fuel.

Replying to the inquiry of R. E. M., crude oil can be shipped to any part of the U. S. and be economical as compared with coal. Distance from the coal and oil fields affects both alike. We obtained a rate per gallon on oil in tank car lots delivered at Grand Rapids, Mich., Grand Haven, Mich., and Minneapolis, Minn., and we found the same relative distance at Minneapolis as at home, or at Detroit.

The use of oil for fuel at Detroit and vicinity has passed the experimental stage, and under what is known as the hydraulic pressure system is not only a labor saving fuel, but is at least one-third cheaper than coal for steam boilers. Besides there is no smoke, no odor, no dirt, no ashes. The fire can be kept steady the entire time night and day. We use the oil, and have complete success with it. I will describe yesterday's routine in running the oil. Being a pleasant day the oil was off from 7:30 a. m. till 4 p. m. The rose houses were down to 62°. Turned on oil for rose houses first, plant houses later. About 9:30 the pressure on the steam gauge was settled at 19⅓ pounds and was allowed to remain at that. At 1 o'clock Mr. Hunter got up, made the round of the houses to see if it was necessary to turn on more pipes; it was not and the pressure being still 19⅓ pounds he went to bed again and did not see that fire again until 8:30 this morning, when the fire was shut off. The night was not very cold, simply a sharp frost. The colder the weather, the better the oil acts and the steadier it runs. I forgot to state that sometimes Mr. H. has not waked up until 4 a. m. and even later, always to find the steam gauge about as he left it. Sometimes it has varied a few pounds, but very rarely, and even if by any chance it did drop to 9 pounds or raise to 25 pounds pressure, an electric alarm attached to steam gauge rings a bell at his bedside, consequently no risk is run any way. We are aware that a great many have failed in trying to use the oil by gravity, that is, the oil is placed in an elevated tank, and fed to the burner from the bottom of the tank. By this method the thick heavy lumpy oil is first fed to the burner, causing the fire to flutter and burn irregularly and to go out every little while, requiring constant watching. Under the hydraulic system the tank is placed from two to three feet underground, and by hydraulic pressure, the oil is fed from the top of the tank; the warmest, thinnest, most vital oil is always on top, just as the hottest air is at the top of a room, and is first fed to the burner, giving a steady reliable flame, very different from the flame given under the gravity system.

An oil plant can be put in now, with as much certainty of its working and proving successful, as a boiler can be set, and by putting a sufficient fire under it, you are certain to raise steam.

This is a subject of vital importance to every florist, having a steam plant, and wishing to economize in firing, and grow No. 1 stock, by being enabled to at all times and in all weathers maintain a steady temperature and without any apparent effort, except to turn on a little more oil and let the fire run.

Manufacturers of

• CYPRESS •

Greenhouse Material,

LOUISVILLE, KY.

Newport, R. I.

Carl Jurgens has been quite unwell for some time. His roses are looking well and will produce a fine summer crop, which is the great desideratum in Newport. Perle and La France are prime favorites with Mr. Jurgens. Houses which were used in winter for bulbs are now filled with fine young roses for summer blooming. Mr. Murphy, one of the indispensables at the rose houses, does not waste much affection on the summer buyers. "They want fifty Beauties today and they don't want them again for six months. They think that you can save them the same as hay," says he.

At the monthly meeting of the Newport Horticultural Society on the evening of May 23 it was decided to hold a summer exhibition. A spring exhibition in April, 1895, is also contemplated. The society has distributed a large number of plants among the school children, to be exhibited later.

A Fish Story.

Our Buffalo scribe, like most in the trade, has been sorely harassed of late by foreign foes in the shape of bulb and nursery agents. His habit was to take a trip to Corfu whenever one of these gentlemen appeared, but as they learn a great deal of patience between Buffalo and the coast this excuse was of little use; the traveling man would simply sit down and wait till he got back. Now, however, he has a new scheme; on being signalled that the enemy has hove in sight Great Scott picks up his trusty fishpole, digs a can of bait, and hies to a nearby brook. When the agent arrives the foreman is very sorry, but Mr. Scott has gone off on a fishing excursion, and there's no telling when he will be back. No one, not even a Dutch bulb agent, would wait under the circumstances, and the scheme is a great success. It is said, however, that mistaking the signals one day Mr. S. got back, fishpole and all, before the enemy had vacated the field, and was so much taken aback that he nearly ordered half a million tulips before he collected himself.

The Tenth Annual Meeting

OF THE

Society of American Florists

WILL BE HELD AT

ATLANTIC CITY, N. J.,

AUGUST 21, 22, 23 & 24, 1894.

Members may remit the annual dues ($3.00) to the secretary prior to the meeting, thus avoiding the crowd and relieving the officers on the opening day. Badge for 1894 will be sent by mail to those who remit in advance of the meeting.

Intending members can obtain any information wanted by addressing the secretary.

OFFICERS:

J. T. ANTHONY, Chicago, president; ROBERT KIFT, Philadelphia, vice-president; WM. J. STEWART, 67 Bromfield St., Boston, Mass., secretary.

Notes.

We said, last week, that Ivory would stand closer planting than other sorts; the variety can be planted five inches apart either way, and will produce beautiful flowers. The foliage of Ivory is much smaller than the others and the roots do not require as much room.

Plants that were propagated during the last of May or first of June can be planted about six inches apart, and should be grown to single stem and bloom. We plant them five inches in the rows, and the rows, which are across the bench, nine inches apart, our only reason for doing this is that we were not provided with as long arms as most of our kindred, to which those who know us can testify, and making the distance between the rows greater makes it easier to tie up the plants. The plants that were propagated in April or previous to that should be given a little more room, about twelve inches, and can be grown to three or four blooms. There are some varieties that will produce much better blooms if grown in this way than on the single stem system, Viviand Morel, for instance. This variety will give just as large a flower and of better color and texture, if grown to three blooms.

Have you cleaned the houses out? and have you thrown out all the rubbish and rotten wood? If you have, then burn some sulphur, and kill all the animal pests that have escaped you. When you do this do it thoroughly, and give them a good dose. We cannot give you any stated quantity to burn per square foot, but to do the job successfully, we burn about two pounds to a hundred foot house. After this give the benches a good coat of whitewash inside.

We still stick to the old way of putting about an inch of green cow manure at the bottom of the benches, notwithstanding that some say it produces a rank growth later in the season. The chrysanthemum is a great eater, and we have found it difficult to get the man that can topdress a bench of these plants with green manure, just as they are beginning to make their growth, without breaking more or less of them, in fact, to tell the truth, we can't do it ourselves. Besides, it is far easier to put the manure in the bottom of the bench, and a little later on you will see how we prevent the rank growth which is not desired. On top of the manure fill in the compost, and put just as much in the bench (that is if they are made four inches deep), as it will hold.

The plants that are in flats or small pots should be now placed where the full glare of the sunlight will strike them, that is, in a frame or a house that is not shaded at all. They will, of course, require a little closer watching as regards watering, for they must never be dry or the wood will harden, and next fall you will have a plant that will be no larger than a pipe-stem at the bottom and as large as your little finger at the top, surmounted by a small flower, for it is almost impossible to force liquid manure through that small hard stem at the base of the plant. But be careful, also, not to overwater, for there are some varieties, Mrs. Alpheus Hardy for instance, that have a weak constitution and are not of strong growth, that will damp off or get diseased, if overwatered. But if you try to grow chrysanthemums in the shade you will certainly draw them, and get a much weaker growth than when grown in the full sunlight.

Now comes the setting the plants. This should be done from the 1st to the 20th

of June. All authorities that have written on this point say set the plants firmly in the ground. This, of course, you will do, but after you have done this, pack the soil down just as hard as you can get it. If the benches will bear you all right, you may be able to do this by treading, but we take a block of wood and a mallet, and make the bed just as solid as we can. By doing this we get, first, fully an inch more of compost (in depth) in the bench, and second, we do not get that rank, weedy growth, which, we all know, does not produce that ideal flower we are looking for. Our friend Lawrence Cotter was the discloser of this to the eastern growers, and we should all be thankful to him for his willingness that we should share in his knowledge. This making of the soil solid will be productive of a much sturdier and stronger plant, which will be much closer jointed, and will not attain nearly the height of a plant grown in a looser soil, and will also produce next fall, a bloom of far better build and more solid and lasting. Mr. Cotter says that he thinks many varieties that are "weak-necked," if grown in a bench where the soil is well packed down, will produce stems that will hold the flowers erect.

ELIJAH A. WOOD.

West Newton, Mass.

Miltoniopsis Bleui Splendens.

This hybrid is the result of a cross between Miltonia vexillaria and Miltonia Roezli, first raised by Mon. Bleu, Paris, and subsequently by Messrs. Veitch, Chelsea, London. Great interest centered in this charming plant apart from its wondrous beauty from the fact that it was the first hybrid raised between these parents. These at that time were commonly known as odontoglossums, hence the name miltoniopsis. The plant illustrated was sold to Mr. Sander by M. Bleu and was afterwards sold to Mr. Ames, a wee bit, two bulbs half an inch in length with four leaves. We have grown it continuously side by side with our vexillariums and find it does well under similar conditions, though we have grown it in a basket. It flowered twice last year making its growths early and flowering last October, and was divided and now (April) has again flowered from three large growths carrying twenty-one flowers. One spike was cut some few days before being photographed. The picture does not do full justice to the flowers. They are nearly four inches across, white with a suffusion of rosy purple in the petals; the lip large and broad with a fan-shaped, reddish brown blotch at the base and in front of the yellow disc, with bright radiating lines spreading over the lips, the lines at the disc being much broader and brighter colored. There are several forms, but when Mr. Dimmock paid us a visit a short time ago he thought our variety was equal to anything he had seen, and he could not resist comparing the plant today and when he tenderly unpacked the mite which he brought over in his valise less than four years ago.

WILLIAM ROBINSON.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

TO PREVENT RUST.—Dissolve one pound of sulphate of copper in two quarts of ammonia in a 2-gallon jar. When dissolved add another quart of ammonia and stir well. [The liquid can be kept in this form for some time and used as needed.] Add a pint of this solution to a barrel of water and syringe the plants with a force-pump every two weeks. And don't let the time for spraying pass without attending to the operation.

Carnation Geneva.

We have noticed that carnation Geneva is compared with Portia as to color. Surely there must be some mistake here. Geneva, as we know it, is white striped purple.

The American Carnation Society has its hands full, trying to keep the nomenclature of its patron flower straight. Some people (and florists at that) are careless, others indifferent, so much so as to obstruct progress. But the American Carnation Society, in order to avoid confusion, is not satisfied with anything short of absolute accuracy. E. L.

[Yes, Geneva is described in the list of carnations, as published in the proceedings of the A. C. S., also in the American Florist's Co.'s Directory, as "white, slightly marked purple." It was disseminated by W. P. Simmons & Co., Geneva, Ohio, about the year 1890.—ED.]

Needs of the Commission Business.

[*Read before the Philadelphia Florists' Club, June 5th, by Samuel S. Pennock.*]

In this country the florist's business has grown to an immense industry, and for that reason, and because of the perishable nature of flowers, the best method of disposing of them is an important matter. Flowers are generally sold in one of three ways: By the grower personally to the retail dealer, by a hired salesman, or by a commission merchant. When the grower sells personally to the retailer he gives more attention to the selling and collecting than a hired salesman would, but he cannot attend to his growing as well, which is very apt to suffer in his absence.

Where a salesman is employed, he has not the same interest as an owner in selling, and if he is not honest there is a strong temptation to defraud the owner. If he sells for but one man, which is generally the case, only that one man is really interested in investigating his honesty. Be he honest or dishonest the owner must lose all bad debts contracted by him. In either of these two methods the time of selling is limited, as the seller is only at one store at a time and to find him after he has left is often a very uncertain job. The commission man however can be found at any time at his stand. If the grower or his representative does not sell out on his rounds to the stores the stuff is generally carried home, thus losing all chances of selling it that day. If, after going the rounds, the flowers are left in the hands of another party they are by that time not in first-class condition, being handled and bruised and the receipts, if any, are necessarily small.

Much of this loss might be saved by sending them to a commission man while fresh. A commission merchant sells the greater part from his store when it is well preserved, not injured by exposure or handling from store to store. A supply of good flowers being generally on hand florists are not obliged to lay in a heavy stock on uncertain sales, but can depend more on the wholesale house, and get as they need. If they find towards the middle of the day, or after the morning supply has been bought, that business looks much brighter, or a lot of orders have come in, they can drop into a commission house and supply their needs.

When flowers become stale for florists' use, the street fakirs buy to better advantage to themselves of a commission merchant, having a larger selection than could be obtained from any one individual grower, or in fact from several. Not only does this hold good in the case of fakirs, but to every one does it apply, and this difference will increase as the grower recognizes the superior advantages offered by him. It is true the commission merchant charges a percentage for selling, but loses all bad debts himself. This percentage in more than one case has been less than the loss by bad debts incurred by the owner selling his own flowers, his time and expenses in selling being an additional loss.

If trade is dull at home or the market overstocked, he, better than anyone else can dispose of them in other cities, where flowers may be scarce and trade good. He also has the opportunity of outside trade at all times, which the ordinary salesman does not have. This amounts to considerable, particularly in an article that overstocks the market very easily, as hybrid roses for instance, as the demand oftentimes is limited and other cities would be able to use the surplus to advantage.

The shipping trade of a wholesale house is one of the strong points in favor of sending them, being an outlet which is often better than home trade. He usually has a large number of consignors, each of whom is directly interested in watching his honesty, not one man only, as in the case of a salesman for a grower. If this salesman is proved dishonest he loses his place, but he may get work where pecuniary honesty is not an important factor. If the commission man is discovered to be dishonest by one of his many consignors he is ruined for all, and in addition to losing his character which will be widely known, he may lose his capital, which is always needed in this business. The greater part of his flowers being sold by himself or in his presence, there is not the same chance of loss by dishonesty of employes as in the case of selling directly by a salesman.

Too much cannot be said in regard to the shipping and cutting of stuff, as so many growers do not seem to fully appreciate this very important fact. It often looks as if they did not use their common sense, and did not take the weather into consideration. During cold weather roses oftentimes are cut just as tight, if not tighter, than in warmer weather, in fact this is not the case just with roses alone, but other flowers also. Roses are sometimes shipped so tight that they are not salable for two days afterwards. Carnations and violets are often cut several days too soon, excepting around the holidays, when sometimes they appear to have been cut a week, and standing in water for that time, judging from the appearance and smell of the stems. A great many growers have a very mistaken idea about holding back flowers before the holidays. They hold them just as long as they possibly can, thinking by sending them in at the last moment they will rea

MILTONIOPSIS BLEUI SPLENDENS.

lize big prices, but the flowers are satisfactory to no one, and perhaps result in the loss to the commission house of good customers. Oftentimes flowers are received apparently in good condition, but have been kept possibly a week; as soon as they are out of cold storage they begin to go back. Generally flowers would bring more if sent in fresh than they do when kept for holidays to the very last minute and arriving when not expected. It may be remembered how scarce double violets were preceding last Christmas. The report was they were not blooming. Hardly a flower could be obtained during the two weeks preceding Christmas, yet when the Saturday before Christmas came you could almost swim in double violets. The high price that was expected was not realized, and in fact they sold for almost anything offered, while they would have brought good money if sent in before. The growers sometimes think they know better than the dealer when to send in. It does not pay to hold flowers for several days for the sake of a few pennies saved on expressage, as the loss on wilted and stale flowers more than makes up the difference. Flowers should always be put in water at least two or three hours, if possible over night, before shipping, thus being stiffer, harder and more presentable.

Some growers do not approve of having their flowers sold on commission, say that it is the poorest way, possibly when they may be judging only from having left a lot of flowers they were unable to sell themselves, but expected the commission man to sell and make good returns. Growers that do something of a retail business sometimes send the surplus, which is generally the poorest, to a wholesale house, expecting good returns. As a rule when that grower's retail trade is dull the wholesale is likewise dull, also the commission man will get far more flowers and of a better quality from that grower too than when trade is brisk. To do a grower's stuff justice the commission man should get his whole crop the season through, so he will have a regular supply that he can depend on, and take orders with a certainty of being able to fill them. As a rule the first ones to cut prices are the growers or their salesmen. They seem to get frightened when things begin to glut up a little, and think the only thing to do is to sell cheaper, whereby if they held on to former prices and threw some stuff away, trade in a few days would again brisk up and the demand be equal to the supply. Prices once dropped are hard to get up again.

It is to be hoped that the contemplated organization of the wholesale dealers of this country at Atlantic City during the coming convention will be of mutual benefit, both to the growers and dealers as well as the wholesale trade.

Another strong point for the commission man is every sale is guaranteed by a responsible party. If he is not responsible no one should patronize him; if it is shown that he has kept back one penny wrongfully from a single consignor no one should patronize him. He should believe what is true, that honesty is his best financial policy, that it is to his moral and intellectual interest to be just, that socially he must always endeavor to follow the golden rule.

Plunging Azaleas.

In speaking of plunging azaleas over summer in hops a Philadelphia grower said: "I have tried it and find while spent hops are good enough for some plants they will not do for azaleas. I remember once I had prepared two long beds parallel to each other, one of old manure and the other of hops. In the latter had been plunged small bedding plants which at this time had all been sold. Having occasion to go away one day, I told a man to place the azaleas in the hops. When I returned the next day, to my surprise they were all very nicely arranged in the old manure. I was annoyed but as they looked so nice I thought I would leave them there and see how they would do for a while. As the hops got dry they blew over the manure and it had the appearance of a bed of hops. But how those azaleas did grow! I never saw anything grow so luxuriantly. This settled the hop question with me, as although I have used them myself and seen others do the same have never seen them grown successfully in this way. They seem to like manure however and make a most wonderful growth when plunged in it." K.

A Very Pleasant Day.

On the fifth of June in response to an invitation very generously tendered to the New York Florists' Club by Mr. W. Bayard Cutting to visit his beautiful place, Westbrook Farm, at Oakdale, Long Island, thirty-nine members of the Club availed themselves of the same. This, considering the very threatening looking morning was more than the most sanguine among us expected. But a large proportion of the members knew there must be something worth going to see, so the weather could not prevent their taking it in.

During the journey there considerable rain fell, but fortunately it held up just before our arrival at Oakdale where three very large hotel wagons with the able and genial superintendent, Mr. Alex S. McLennon met us and took the entire party to Mr. Cutting's house, driving past the entrance of Mr. W. K. Vanderbilt's place, past the South Side Club House and entering the grounds by the main entrance where is situated a most unique lodge recently built and thatched with heather from the Highlands of Scotland. This called forth many complimentary remarks and undoubtedly brought many pleasant recollections to the sons of Bonnie Scotland, of which there were a goodly number in the party.

Immediately after passing through the gates the gorgeous beauty of the place begins to open to us. The rhododendrons are here seen in all their glory, grouped as they are at different bends of the carriage road, each color predominating in groups by itself or blending so that perfect harmony prevails everywhere. Here stands a very large group of nearly white with a few deep purple in the background, the whole having a back of natural woods, which with the bright green foliage lends enchantment to the whole. Nearly all the planting done here is simply clearing away the original undergrowth in suitable places, replacing it with the desired class of plants. Another clump, sinking down into a beautiful dell are all the fine deep rose purple "John Waterer"; this clump must cover considerably more than half an acre of ground. Then we come upon a large mass of white and scarlet, but unfortunately the latter were past their best. Another mass is nearly all that beautiful blush pink shade so much admired in Daybreak carnations. Further on we come upon a fine open lawn gradually rising to where the house stands, and what a house it is. To the ordinary observer one would think there were room enough and to spare for a hundred people, and certainly we found an abundance of room to thoroughly enjoy the sumptuous lunch provided for us, after being most cordially and pleasantly received by Mrs. Cutting and her sister Miss Yulee, who expressed much regret at the forced absence of our host Mr. Cutting, who had been very unexpectedly called away on important business and our only regret was that we could not have the great pleasure of meeting him personally to express our full appreciation of the pleasure of visiting his beautiful place.

After doing full justice to all the good things for the inner man we all registered and commenced a tour of the ground. Only a small portion of the 1600 acres of course could be travelled over in the limited time at our disposal, but at every turn some new and interesting feature presented itself, rambling away through the woods which are tastefully arranged with flowering shrubs of many varieties in groups, rhododendrons predominating but kalmias, syringa and many other families are represented in groups wherever a suitable place presents itself.

The fish ponds are a great feature here, fed as they are by pure spring water the fish are in their glory and the water is as clear as crystal. On the banks of these are some noble clumps of the great favorite of the place, and choosing a position where they fully reflected their glowing colors in the water we could not help thinking it was indeed a fairy scene. But time is pressing and compels us to move on. Suddenly we come upon a large mass of Iris aurea and looking across the lake another is reflected in the water, and so we go on from one pleasant scene to another until we come back to where art is doing nearly all the beautifying, as nature here has not lent the helping hand as in that part already gone over. The arboretum is already furnished with some very beautiful and choice things, and additions are being made steadily. The old-fashioned flowers, aquilegias among them, were in perfection and are largely represented in a garden devoted to such things. Next comes a large flower garden laid out in graceful and easy design. All these had to be made at great expense, as the natural soil is nothing but sand and gravel, which had to be removed and replaced with good soil. Behind this again are situated the greenhouses, in which were growing among other things a fine collection of chrysanthemums. The premier prize for the best arranged group was won by Mr. Cutting at the New York show last year, and, judging from the condition of these plants, he would have very little trouble in carrying off another this year should opportunity offer. Mr. Cutting has always been a most liberal exhibitor at and patron of horticultural shows.

Near the greenhouse is situated a trial ground where many of the new and choice kinds of rhododendrons are being tried before introducing them into permanent plantations; among them are some exceedingly beautiful things, notably one called "F. B. Hayes," but space forbids us from enumerating these and many other fine things.

From here the entire party were escorted to the farm proper, where can be seen probably the best model cow stable and dairy to be found in America. These and all other appointments of the farm are on a very fine scale.

After viewing all that time would permit we were introduced into Mr. McLennon's office, where large cans of new milk fresh from the fine Jersey herd were placed before us with crackers and cheese, and, notwithstanding the ample justice done at the lunch table, equal justice and punishment awaited the rich bovine produce, after which we were invited to ride to Islip and Bay Shore over a beautiful road, which all very much enjoyed. Here we took the train for our return journey after having spent one of the most enjoyable and instructive days we ever had, every one feeling deeply grateful to our host and his able superintendent, Mr. McLennon, who is so ably carrying out the desires of his employer, and it is the earnest wish of everyone that they may all be blessed with a long life and be enabled to carry on the great work they have only started in, then in a few years Westbrook Farm will indeed be an ideal place.

Nearly all that has been done here to beautify and improve it has only about six years to its credit, which has been the term of Mr. McLennon's incumbency, and every part of this fine place shows distinctly the mark of a master hand. Its perfect keeping in even the smallest detail, and the whole place is really a model. Long may be it remain so and it owner live to enjoy it. JOHN N. MAY.

Hardy Plants for Cutting.

This is a good time to make notes of some of the best hardy plants for cutting, and the selection should be carefully chosen of such varieties that follow one another, so that anything like a continuous supply may be insured. Where there is a good collection of flowering shrubs, beds of roses, and a mixed herbaceous border, there is always something to cut, but in addition to this it is always an advantage to have a few good sized beds of plants for this purpose, and still find plenty of successional bloom without disfiguring the beds too much. To obtain this the plants must be well established, the soil well enriched, and a good mulching of manure applied in winter. For the convenience of gathering the flowers, beds about 4 feet wide with alleys between are the best, as if they are put out in large breadths more shoots will get broken down in the constant visiting these beds get during the flowering season than would be got from the alleys if they were all planted. The list of good plants is very large but the following will be found suitable.

Achillea Ptarmica, with its innumerable heads or bunches of pretty little double white flowers, keeps on flowering nearly the whole summer, and the more freely it is cut the more does it produce flowering shoots. All the attention it needs is a good mulching of manure in winter and keeping free from weeds in summer. It is well adapted for wreaths. Achillea serrata plena (the Pearl) is one of the very best white flowered plants for the border or cut flowers. It lasts longer in bloom than the other varieties, and is somewhat later; it much resembles a pompon chrysanthemum.

Campanula persicifolia alba plena is a real gem; it spreads freely, and may be increased by division. This will also force well, especially late.

Delphiniums are splendid flowers for cutting, and give a great variety of color. If the central spikes are cut as soon as the flowers expand, the side shoots spring up and continue a long time, and are really more serviceable than the first bloom. If left to seed the flowering is soon over. D. formosum is easily raised from seed, and makes a fine show with its rich blue spikes of bloom.

Helianthus multiflorus or perennial sunflower, is one of the best for supplying cut flowers. Once planted a good top-dressing will keep it right until it requires taking up and dividing, replanting, if possible, on fresh soil.

Lathyrus grandiflorus is the everlasting pea; both red and white flowered varieties are invaluable for cutting, and if planted near a fence or something they can climb over, they will yield an unfailing supply of bloom, and make objects as well. They do not like being disturbed, and if left for years the better result will follow. Top dressing well over the crown in winter is all they require.

Pyrethrums single and double, are very beautiful and they are now of so many varied colors that they are well suited for cutting from, and can be used for any decorations.

P. uliginosum is a tall handsome species, and one of the best of the family, as it comes in late, when flowers begin to get scarce in the fall. For florists' and

THE AMATEUR ORCHID GROWER'S DREAM.
[*Reproduced from the Journal of Horticulture.*]

cut flower purposes it is very valuable. The flowers resemble a marguerite.

A. J. E.

The American Association of Nurserymen.

The 19th annual convention of the American Association of Nurserymen opened its session at the Cataract House, Niagara Falls, June 6. There were about 70 members present when the meeting was called to order, but by the following morning there were about 230 recorded on the secretary's books, and they represented almost every state and territory in the Union. The convention expected to be addressed by Gov. Flower, but he was unable to be present, and President U. P. Pearsall of Fort Scott, Kan., delivered the opening address. The president referred to the very trying time during the past year to the nurserymen, but said he believed they had on the whole fared better than men in other lines of business, as their stock had not suffered any more damage, nor had any more been wasted than in former years. The nursery business was, he said, a tax on the nervous system, and attendance at these meetings was a benefit to all delegates, while the surroundings of Niagara afforded a grand opportunity to study nature closely. The horticultural press and the medical fraternity had helped the nurserymen by urging the consumption of more fruit, calling attention to its wholesomeness as a diet. Another improvement for the trade was better railway facilities all over the country for shipping fruit to the markets of the world. The speaker thought nurserymen should hold up the apple and peach crop for fear of overproduction. In reference to insects and disease he considered that a more liberal application of wood ashes and other forms of potash would be most beneficial. Regarding legislation the president referred to the unfair action of some of the western states, notably California, in practically placing an embargo on fruit and nursery stock, requiring all fruit to be inspected for insects and infectious diseases before it was allowed to pass. "Better laws should be made in reference to this, and we should at least have free trade between states."

Papers were read on the first day as follows: "The most profitable method of introducing new fruits," by Mr. J. H. Hale of So. Glastonbury, Ct.; this paper was of unusual interest. In this connection he suggested that a collection be taken up for E. W. Bull, the originator of the Concord grape, who is now 80 years of age, and dependent on charity. There was a very liberal response among the members. The next essays were on the nursery industry by gentlemen representing a wide separation of territory, the east by W. C. Barry of Rochester, N. Y.; the south by P. J. Berckmans, Augusta, Ga.; the north by J. Cole Doughty, Lake City, Minn., and the west by H. Augustine of Normal, Ill. A paper on the "Natural value of synonyms," by Prof. L. H. Bailey of Cornell University closed the essays for the day; Prof. Bailey was as interesting as he always is and "profound in his learning."

The first day's session closed with the election of officers for the coming year, with the following result: President, J. H. Hale, So. Glastonbury Ct.; Vice President, Hon. N. H. Albaugh, Tadmor, O.; Treasurer, N. A. Whitney, Franklin Grove, Ill.; Secretary, George C. Seager, Rochester, N. Y. Executive committee, Irving Rouse, Rochester, N. Y.; W. J. Peters, Troy, N. Y., and D. S. Lake, Shenandoah, O. The convention of 1895 will be held in Indianapolis, Ind.

On Thursday there was but one session instead of two as intended, a prolonged session concluding the convention. The meeting adjourned about 2 p. m. The papers which were scheduled to be read, but which were omitted, and will be published in full in the proceedings were: "Why are foreign grown shade and evergreen trees so largely sold by American nurserymen," Irving Rouse, Rochester; "Cause of low prices in nursery stock," Chas. A. Green, Rochester.

An interesting paper on Forestry was read by Robert Douglass, Waukegan, Ill. Mr. Douglass is said to be the oldest nurseryman in the United States. Mr. C. Worden of Niagara Falls, Ont., read a paper on "Nurserymen's novelties." "The Rocky Mountains: will they be fruitful" was read by S. M. Emery, Bozeman, Mont., and "Culture of standard pears" by Wing R. Smith of Syracuse. The convention finished its deliberations with a lively discussion on the tariff question, which was precipitated by the paper read by Mr. Geo. A. Sweet of Dansville, entitled "Our foreign relations." Before the discussion subsided everybody had expressed his political affiliations, and it ended in the same old story. Those who wanted imported stuff didn't want any tariff for protection, while those who grew everything they offered for sale were stiff protectionists, and patriotic at that. There were a few exhibitors among them. Very pretty little conifers (called evergreens in this country) by D. Hill of Dundee, Ill.; the same class of exhibits by the Elgin Nursery Co., Kane Co., Ill., and the Niagara River Nurseries, Youngstown, N. Y. The Rochester Lithographing Co., had marvelous specimens of their art (on paper) portraying plums, apricots, flowering shrubs, etc., which we have longed for, but they never came.

The nurserymen were photographed in a group on the banks of the Niagara, with the rapids for a background, and what more beautiful place could be selected for a convention? Everything was beautiful except the weather, and that was chilly, windy and cloudy. Altogether President Hale told the writer that the convention was in all respects a success. My own impression of it was that the association is composed of a solid, substantial and business-like lot of men and a credit to any profession. It would stagger the man who owns only a city lot or two, or an acre in town to hear these men talk about seven hundred acres here and a thousand there. Here is the record of one whom I had the pleasure of meeting: Mr. Frederich G. Withoft of Dayton, Ohio. He is one of the proprietors of the Dayton *Daily Press*, vice-president of the Albaugh Nursery & Orchard Co., Tadmor, O., with 500 acres: president of the Ohio Land Fruit Co., Fort Valley, Ga., 1820 acres; treasurer of the Albaugh-Georgia Fruit Co., Fort Valley, Ga. 1172 acres; treasurer of the Kentucky River Fruit Co., Gratz, Ky., 250 acres; director of Woodstock Fruit Co., Gratz, Ky., 300 acres; director of Oakridge Fruit Co., Kathleen, Ga., 600 acres; director of Tivola Fruit Co., Tivola, Ga., 1536 acres; director of Moss Lake Fruit Co., Fort Valley, Ga., 600 acres. This is only a sample copy picked out at random. He is not only the possessor of much of this world's surface, but also the happy owner of a kodak of the most improved variety. While riding on the substantial trolley railway on the brink of the gorge for 12 miles and back, some of it so close to the bank that it makes nervous men wish Niagara had never been discovered, this lively gentleman from Ohio operated on everything that was in his opinion worth taking a shot at. The patience of the trolley men passed all understanding. A score of times we stopped our twenty-five mile an hour gait to allow Mr. W. to get a shot. And he shot everything, from the oldest printing house in Ontario up to Brock's monument, and finished off by taking a shot at the last drop of water that ever shot over Niagara Falls when he pushed the button.

W. S.

The Asparagus Beetle.

The twelve spotted asparagus beetle is reported to have done serious damage to the crop in Monroe county, New York. This beetle was first observed in this country at Baltimore in 1882. Since then it has worked its destructive way slowly along the coast. Prof. Lintner, the New York State Entomologist, recommends sprinkling the plants with powdered lime and turning the chickens loose.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

Boston.

The annual rhododendron show of the Massachusetts Horticultural Society was held in their lower hall Wednesday and Thursday, June 6 and 7, and as this was the first large show of the year to which no admission is charged, the beautiful display was very much admired by a large number of people. The committee of arrangements must be given a great deal of credit for the arrangement of the exhibits, which was very much appreciated by the many visitors.

Upon entering, the long wide table, which extended the entire length of the middle of the hall, was filled with the display of James Comley, gardener to Francis Brown Hayes. Large vases filled with branches of the vari-colored oaks, maples and beeches, interspersed with viburnums and syringas, were placed the whole length of the middle of this table and were flanked on either side with beautiful large trusses of rhododendrons and hardy azaleas. At the head of the hall a series of tables, each rising above the other, were filled with the exhibit of H. H. Hunnewell. The display consisted of magnificent trusses of rhododendrons, backed by hardy azaleas and colored foliage. This exhibit contained seventy named varieties of rhododendrons, but was not entered for competition. The table on the left was occupied by J. L. Gardner, Jos. S. Fay and the Shady Hill Nursery Co. The first named showed immense trusses of rhododendrons; Mr. Fay a large display of hardy flowering trees and shrubs, and the last a beautiful display of herbaceous plants. S. J. Trepass showed a few handsome trusses of rhododendrons and captured the first prizes for twelve and six hardy varieties.

On the right centre table, T. C. Thurlow exhibited forty-five varieties of hardy azaleas, and branches of colored foliage, among which was noticed five varieties of the English oak. This table also contained exhibits of pelargoniums from E. Sheppard & Son of Lowell and W. E. Coburn, the former showing all named varieties, and a beautiful strain of pansies from I. E. Coburn. On the table at the right side of the hall the German irises were shown, and this class brought out an unusually large number of exhibitors and close competition. J. L. Gardner, W. H. Cowing, Mrs. E. M. Gill, Jackson Dawson, M. F. Stevens, Mrs. E. H. Wood, F. S. Davis and Francis Brown Hayes competed, the prizes being taken by the first named.

The many lovers of native flowers fully enjoyed the displays made by Misses C. M. Endicott and M. C. Hewitt, Mrs. P. D. Richards, Geo. H. Grinnell and the Misses Doran, all of which contained many rare specimens.

Mr. Lawrence Cotter showed some beautiful hardy pyrethrums, filling seven large vases with as many named varieties, easily capturing first prize.

The first prize for herbaceous plants was taken by J. W. Manning, second going to the Shady Hill Nursery Co. Baskets of flowers were shown by Mrs. E. M. Gill and Mrs. A. D. Wood, and Jackson Dawson made an exhibit of forty varieties and species of roses. Seedling clematis were shown by Robert Manning and Mrs. M. T. Goddard, and in the latter exhibit there was one variety which was very beautiful and was awarded a complimentary notice. A large branch of Viburnum tomentosum shown by George Chase of Salem attracted a great deal of attention. William Nicholson exhibited vases of Nicholson and Ada Byron carnations, and H. K. Southworth a large vase of Buttercup.

The month of weddings has arrived, and all the florists are wide awake, each one looking for his share in this line of work. The event of the week was the Ratschesky-Shuman wedding, the local papers filling columns of space with accounts of the event and illustrations of the floral decorations. Galvin Bros. were the lucky ones on this occasion.

The Saturday exhibition at Horticultural Hall was very small, owing to the rhododendron show having occurred during the week. Jos. Tailby & Son showed a plant of Richardia africana Elliottiana in flower. This is the yellow calla which was placed upon the market in October, 1892, by Hugh Low and Son, and as far as known is the first exhibit of it in this country. It is a beautiful yellow in color and a valuable acquisition. The Society awarded them a silver medal.

New York.

On the 5th of June on the invitation of Mr. W. Bayard Cutting, the New York Florists' Club visited his country seat at Oakdale, L. I., some 40 miles from New York City. Although the morning was rainy no less than 38 members of the Club availed themselves of the opportunity. On the arrival of the train at 12:45, the party was met by Mr. Alex. McLennon, the able superintendent of the estate. After a pleasant drive of about two miles the mansion was reached, where the party was received by Mrs. Cutting, who regretted the unavoidable absence of Mr. Cutting and who gave a cordial welcome to the guests. After the reception the party proceeded to the spacious dining room, where a delicious lunch awaited and was relished by the visitors. After the lunch Pres. P. O'Mara, on behalf of the Club, thanked Mrs. Cutting for the privilege of visiting the estate and the kind hospitality extended to the Club. At the request of Mrs. Cutting every member subscribed his name in a visitors' book and then under guidance of Mr. McLennon the party proceeded to examine the many beauties of the place.

The rhododendrons presented a grand spectacle, several acres of them being in flower, arranged in informal beds and massed in solid colors. The hardy herbaceous plants, of which this estate contains a large collection, were in masses of the most popular kinds, especially irises and lilies. The unsurpassed collection of trees and shrubs was also greatly admired, while in the greenhouse some fine American Beauty roses, crotons and various foliage and flowering plants could be seen. The whole grounds were in perfect condition and reflected great credit on the superintendent.

The plan adopted here is to conserve and enhance the natural beauties of the place rather than to attempt any artificial gardening.

From the garden a tour was made through the stables, dairies, dog and chicken houses, etc., with which this estate is fully equipped. Then a short rest at Mr. McLennon's office, where again refreshments were served, the milk especially was highly commended and numerous inquiries made as to the cow that gives such fine liquid. Here the party divided, those having appointments for the evening were driven to the Oakdale depot, while about half the party enjoyed a long drive to Bay Shore depot, where after giving three cheers for Mr. McLennon the party took the 6:50 train for New York, greatly delighted with the day's outing.

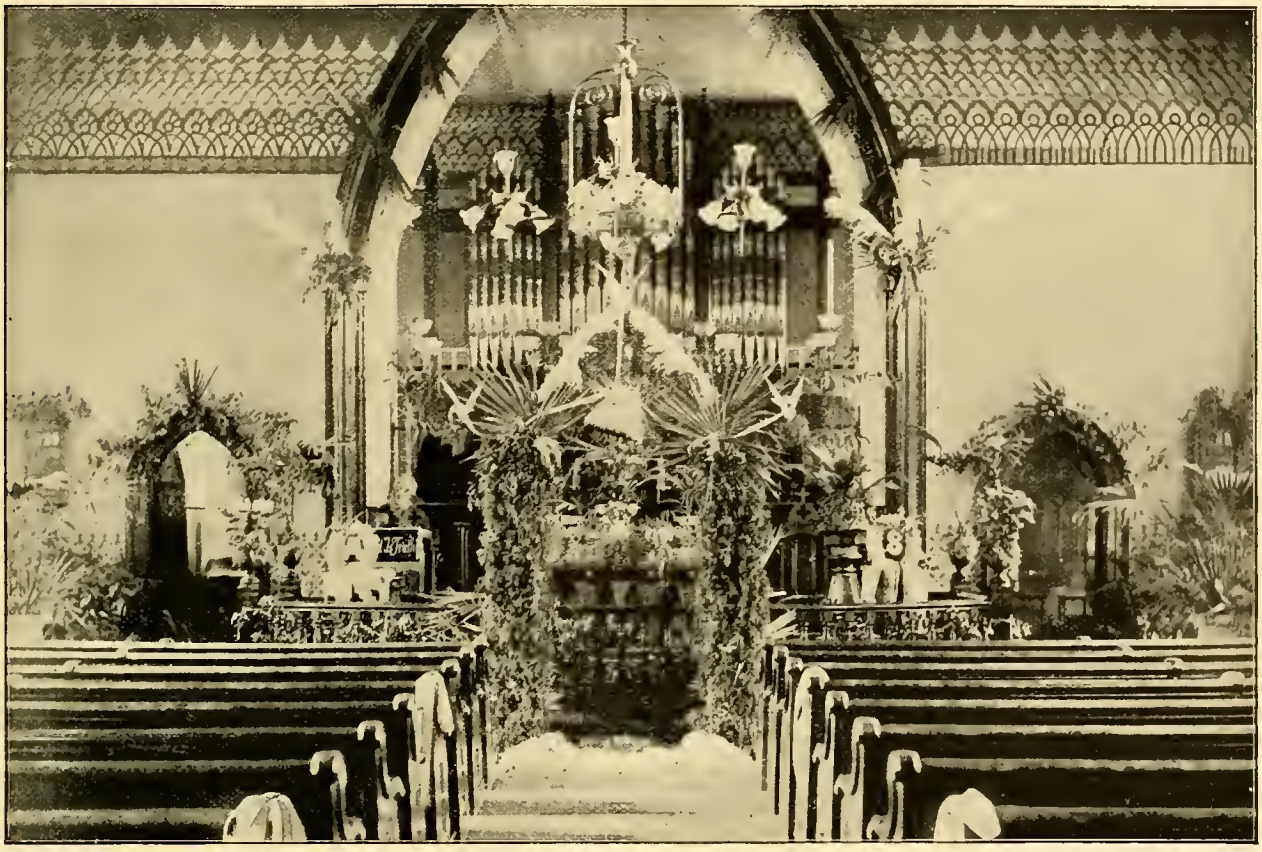
An excursion of this sort should be taken at least once a month to either private or commercial establishments when any specialty is at its best. It would be not only pleasant recreation but also highly instructive and profitable to everyone.

Among those present on this occasion were: Pres. P. O'Mara, Treas. Chas. B. Weathered, John N. May, Alex. Burns, Rudolph Asmus, Julius Roehrs, Theo. Roehrs, I. Forsterman, E. Koffman, Chas. Weeber, N. T. Cottam, C. H. Allen, F. Storm, P. Dailledouze, H. Dailledouze, Chas. Zeller, W. A. Manda.

Philadelphia.

The June meeting of the club was quite well attended. There were several out of town members and visitors, including Mr. Abraham Bitner of Lancaster, Mr. Herr of same place, and Mr. J. L. Dillon of Bloomsburg. Details of entertainment of visitors were discussed and the reports showed all the committees up and doing.

Mr. S. S. Pennock read a very interesting paper on "The needs of the commission business," which was well received and for which Mr. Pennock was given a vote of thanks. [The paper appears elsewhere in this issue.—ED.] In the discussion which followed George Anderson said the commission men could soon get all the Philadelphia product to handle if they would guarantee growers the same as they received by present methods. Mr. Heacock was not sure that the present plan of growers peddling their own flowers was the best and favored the market plan rather than the commission men. A number of growers were present who no doubt did a lot of thinking, but had not much to say.



Otto Horn of Frankford died last week after an illness of a few days. Mr. Horn was 36 years old. He leaves a wife and several small children. Mrs. Horn will continue the business.

There have been at last two whole days without rain and it would really seem as if we were to be favored with a fine day now and again. The continuous wet weather interfered to a considerable extent with planting, both inside and out, as the soil could not be handled. It will not take long, however, to catch up with the work should the present sunshiny days continue.

There is little to be said of the business of the past week. There has been some work for weddings and school commencements, but the general trade has dropped down almost to a summer basis. With the exception of the mildew on the foliage the roses have been fairly presentable and not over plentiful. Prices remain about the same as last week. Mermets, Brides, La France, $4; Kaiserins, Testouts, $5 to $6; good outside Jacqs, $4; Beauties, $1 to $3 per dozen; carnations of fair quality, 75 cents to $2. Wilder and Daybreak show up very well among the pinks, and McGowan is still a leader among the whites.

Paeonies sold very well this season and are now about over. They brought from $4 to $10 per hundred. About all the valley now in the market comes from Newport and sells for $4. There is quite a demand for sweet peas, white being particularly scarce the past week. We think the growers would do well to bleach a little more of the seed before planting, as the white is a good seller. Swainsona was used as a substitute for white peas and made a very good counterfeit.

Sunday, the 9th inst., was Children's

CHURCH DECORATION.

Day in the Methodist churches and nearly all were decorated. In one church laurel branches in flower placed in buckets of water among the foliage plants were used with good effect.

There is very little in flower now in potted plants. August Lutz has some nice hydrangeas very well flowered for this season. How did you do it, August? These with a few very pretty Canterbury bells from Miller are about the only blooming plants now to be seen.

H. Rainey's interest in the firm of Ehret & Rainey was sold out a week ago on a judgment of $200, entered up by Julius Wolf, Jr., and bought in by him for $25. This closes out Mr. Rainey's interest in a good business established about 20 years ago. Some five years back Mr. Rainey was doing a fine business. About that time he took in a special partner, giving him a very small interest at first, but this fellow, who has had a very large experience, finally got the upper hand and crowded Harry out. His name is John Barleycorn. Mr. Rainey was a very hard worker and was scarcely ever seen outside of his store. We feel very sorry for him and hope now that his partner has been shown up in his true light that he will drop him forever and begin over again on his own responsibility. He is still young and will find plenty to help him if he shows himself worthy of their assistance.

A little more hail. F. Hahman, near Frankford, suffered a loss of 8 to 10 boxes, and it seems singular although the storm covered considerable ground the hail was not heavy enough to do damage to establishments, even in the immediate vicinity of Mr. Hahman. K.

Church Decoration.

The accompanying engraving is from a photograph of a church decoration arranged for a wedding by Mrs. Henry Rehder, Wilmington, N. C. The plants used were mainly palms, hydrangeas, rubbers and ferns. Wild smilax was also freely used. The picture is suggestive as showing what may be done with rather ordinary material and for a comparatively moderate price.

St. Paul, Minn.

The cut flower trade has been lively and June may yet be the banner month of the year for the retailer. Roses and carnations are especially called for, and while the cut has been large and the quality good still the demand has been ahead of the supply. Retail prices have not materially advanced, though the best roses are bringing $1.50 per dozen. Growers hold prices firm at $4 to $6 per hundred.

In the plant line trade has been a little dull, but stocks are now low, the best having been sold. Some beds and vases are still being planted, but that class of work is practically ended, and florists are busy planting out their carnations, violets, etc., and getting their rose houses in shape for another season's business.

At Como Park, bedding out is nearly completed and the warm weather of the past week has brought every thing forward in fine shape. Geraniums are looking exceptionally fine for this season of the year. Pæonias massed and grouped on the side hill are now in full bloom and are very effective. Hybrid Perpetual and yellow summer roses are just coming into bloom and suggest the beauty that might be added to the park by planting more of them. We presume, however, that they will be planted in due time, as Supt. Nussbaumer is fully alive to the requirements of the park and has produced marvelous changes in the past two years.

L. L. May & Co., have a house of Kaiserin just coming into bloom. The flowers are large, of fine form and very free bloomer we should judge. As a summer rose they seem to fill a long felt want, and will undoubtedly soon be planted extensively by our florists. For winter blooming they have never been thoroughly tested here, but will be given a trial the coming season. This firm has just completed planting out carnations and violets for another season's forcing. Daybreak, Silver Spray and Portia are the standards in their respective colors, while Helen Keller, Jacqueminot, Uncle John, Stuart, E. A. Wood and other new varieties will be planted quite extensively another year.

Chris Hansen is cutting some very fine Testout, the finest that has yet been shown in this market. While not as free a bloomer as the La France it seems to hold its form and color better in warm weather, and will become a general favorite.

All of our rose growers have been cutting some nice roses this spring. While credit for this of late belongs to the favorable weather the general average has been maintained by careful watching and firing nights whenever there was a sudden drop in temperature. Very few mil-

dewed roses have been seen, and the growers have been well repaid for the slight additional expense of night firing in warm weather. Trade promises good for two weeks to come, as there is a large country demand for flowers for "commencements."

F. G. Gould of Excelsior, on the shores of the beautiful Lake Minnetonka is just now sending in some fine carnations. Hinze's White is grown to perfection, while Portia, Daybreak and Garfield are all fine. Brother Gould seems to have learned the art of producing fine carnations in summer and many of the boys would like to learn his secret.

By the way, have any of our friends noticed the tendency of the Daybreak to fade in hot weather? If cut and placed in water it holds its color, but when fully expanded in the bright sunshine it fades. This only shows that no flower is perfect at all times.

Mr. J. S. Taplin of New York was a visitor during the week. His first impression of the great Northwest is a favorable one. FELIX.

Chicago.

The market is very quiet, with supply slightly exceeding demand. Roses are in fair demand, but their quality is getting poorer every day. Mildew appears to be the rule, though occasionally a lot of well grown flowers may be noted. Reinberg Bros. are cutting some very fine Kaiserins. The wood appears strong and vigorous, foliage perfectly clean. Kennedy of Lake Forest ships in some good Bridesmaids cut from young stock planted the middle of February.

Prices have remained nearly stationary. Beauties still lead in demand. The average stock received is getting small and rather poor, though O. P. Bassett and Reinberg Bros. are still handling good blooms. A wide range of price, from $5 to $20. Meteor and Bridesmaid meet with good demand at 4 to 5. La France is selling fairly at 3 to 5. Mermets are slow at 3. Brides and Woottons go at 3 to 4. Perles are slow at 3, and Gontiers at 2. Carnations, which have kept up wonderfully well all the season, are now getting very small. Corbrey & McKellar are still receiving extra fine blooms of Daybreak and Tidal Wave, grown by Henry Munôt. These flowers are disbudded, and, considering the season, are really fine. Of these Daybreak brings $2.50 to $3 and Tidal Wave $2. Common stock is down to 75 cents.

Pæonies, though very plenty, have not been as badly overstocked as was feared. This is largely owing to the fact that some of our largest growers are holding back the bulk of their cut in cold storage until the general market is cleared up. Good stock sells for 35 cents per dozen, Drop white 50 cents, but a good many of the poorer grades go for less. Sweet peas are plenty and of good average quality. Supply some days is in excess of demand. Good stock is selling at 35 cents to 40 cents.

Geo. Klehm is marketing a heavy crop of longiflorums. As Harrisii is nearly cut out these meet with good demand at $1 a dozen.

Retail trade is rather spasmodic. Some are as busy as bees some days, there being quite a crop of June weddings, and at other times business is of midsummer dullness.

Mr. A. Wiegand of Indianapolis recently passed through the city on his way to California, where he will spend several weeks.

Z. K. Jewett of Sparta, Wis., stopped off to visit friends on his way home from the Nurserymen's convention at Niagara Falls. He reports a very successful and profitable meeting.

Buffalo.

Adams & Nolan made an assignment last Tuesday; cause unknown. It is believed that one or both of the firm will very soon resume, as affairs are much brighter than is usually the case in matters of this kind. W. S.

Under the Rose.

Some years ago Mr. C. B. Whitnall, the florist of Milwaukee, Wis., had a friend who was a student of Oriental religions and who had a leaning toward belief in the Buddhist theory of transmigration of souls. They had many discussions over this and similar subjects and as a result "the dreamer" asked that Mr. Whitnall plant on his grave a rose bush of his favorite variety (should Mr. W. survive him) and see that the same was carefully tended until it had taken permanent hold of the soil, so that his ashes might be by the usual course of nature transformed into the flower he loved in life. The incident coming to the attention of Mr. Eben E. Rexford he made it the subject of the following poem:

Often and often they talked together,
In the sweet Spring days or the sad Fall weather,
Of the life that is and the life to be,
Awed and perplexed by its mystery.

Here for a day, and to-morrow, where?
When the grass grows over us, lying there
In the still white city where dead men dwell,
What shall we dream of? Who can tell?

Can the dead come back? Do the living feel
Through the dear old places softly steal
The presence of those who have gone away
From the World we live in? Who shall say?

"I believe," one day the dreamer said,
"That in time to come, when men call me dead,
I shall live again in the flower that grows
Over my grave, My friend, who knows?"

"When I am dead I would have you make
My grave near by for old friendship's sake,
It would seem less lonely if you were near,
Though dead, I would feel you, would know and hear!

"Plant in the mould that is heaped above,
He who forgets not, the rose I love,
And into my heart its roots will grow,
And feed on the dust of the dead below.

"So I shall become a part of the rose
Growing out of my grave, and each flower that blows,
Shall be a message of love I send,
From that grave to each old and steadfast friend."

* * * *

He died, and his ashes are hidden away
Under the roots of a rose to-day,
And into those ashes the rose will grow
And feed on such food as few roses know.

The heart of the dead to the flower will give
Its sweetness and beauty, and those who live
And are true to the friendship of old will know,
That the dead remembers!—And love will stir
Their loyal hearts for the friend below,
Who makes the rose his interpreter.

Park Superintendents will Organize.

An Association of Superintendents of Parks and other Public Grounds will undoubtedly be organized in the near future. A number of leading superintendents have already expressed themselves as heartily in favor of such an association and the organization promises to be a strong one.

Certainly much good could be accomplished through such a society and we congratulate the superintendents upon their decision to organize.

We hope to be able to give full details at an early date.

News Notes.

TOPEKA, KANS.—R. J. Groves, Jr., is building a new house 16x100.

NORWALK, O.—Mrs. C. W. Boalt has entered the florist business at 114 W. Main St.

PLYMOUTH, IND.—Mr. William Holland, the nurseryman, is a candidate for county treasurer.

APPLETON, WIS.—W. H. Rogers is preparing to add several new houses to his establishment.

SARATOGA SPRINGS, N. Y.—John Ralph has purchased 50 feet of additional frontage adjoining his premises.

GREENSBURGH, PA.—D. M. Shearer & Co. have removed from North Main St. to the Press Building, West Otterman St.

BARABOO, WIS.—Mr. Beebe Strong is contemplating the erection of greenhouses here with the idea of starting into the florist business.

WOBURN, MASS.—E. G. Bridge is erecting a three-quarter span violet house 16x80 glazed with 16x24 glass, to be heated by hot water.

INDIANAPOLIS, IND.—Mr. A. Wiegand is on his way to California. He will view the mid-winter exposition and visit various points of trade interest.

HAMILTON, N. Y.—Mrs. D. M. Fairchild is starting in the florist business here and is building two houses, one 18x70 and one 18x90, also a palm house. It will be conducted by "Bert" Starr.

PHŒNIX, ARIZONA.—Adams & Armstrong, nurserymen, have dissolved partnership. Their entire stock has been purchased by the Armstrong-Kendall Fruit & Nursery Co., who will continue the business.

CHARLESTON, S. C.—Mr. J. M. Connelley has moved into his handsome new building on Meeting St. A local daily describes it as "A substantial improvement that Charleston may look upon with pardonable pride."

HOUSTON, TEXAS.—While final arrangements have not yet been completed it is certain that we shall have a chrysanthemum show here again this year and that it will be much larger and more attractive than that of last year.

CHATTANOOGA, TENN.—The Chattanooga Floral Society will give an exhibition June 14. Reduced rates have been obtained from the railroads and it is expected there will be a large number of visitors from surrounding towns.

SAN FRANCISCO.—The executive committee of the Mid-winter Fair has offered to present to the commissioners of Golden Gate Park many of the Exposition buildings to be used for park purposes. It is probable that a number of the buildings will be accepted by the commissioners and that they will remain as permanent ornaments of the park.

PEORIA, ILL.—A board of park commissioners for Peoria has been organized by direct vote of the people, with power to make their own levies for park purposes. The board has already been offered 200 acres of land as a gift for the nucleus of a park or park system, and the work of selecting ground and the improvement of same will soon be taken up.

Blighting of Blossoms.

It is understood that flowers are organs for a special purpose, namely the production of seed, and many of the parts serve only in the important work of fertilization and then fade and fall away. In short the showy portions of flowers are transitory organs, and are not expected to endure for long. Because delicate in structure and not provided with the thick epidermis characteristic of more permanent parts they are subject to the attack of various forms of moulds and blights.

These fungi only do damage by coming too soon and if their work was confined to petals and sepals the damage would not be so great as it is at present.

Many of our fruits suffer greatly from moulds which possibly primarily attacking the more delicate petals, spread from them to the pistil and there cause the destruction of the young fruit before it has made more than its initial growth.

One of the most serious of these blights is the gray mould (*Monilia fructigena*) which is familiar to all orchardists as the cause of the rot that destroys the cherries as they are nearly ready for picking. The plum suffers in a similar manner and from the same cause whole orchards of peaches are robbed of the fruit before it is large enough to be conspicuous. A careful study of this mould shows that, living over the winter in mummified fruit on tree or the ground the germs often first attack the tender petals of the blossom and then pass on to the young fruit.

But it is not of the blossom of the fruit orchard that attention is more particularly called at this time. A few days ago a florist asked me to give him some reason for his orchid blossoms turning spotted soon after they unfolded. This spotting of the strange and magnificent blooms of a rare orchid is a serious matter, for it makes all the difference between a flower of great beauty and long duration and an unsightly thing quickly ruined. When the sun is too strong it is possible for a bloom to be overheated and burned; but in such cases the blotch shows by its shape, etc., the cause of the difficulty. The spotting in question begins as minute specks and the dead area spreads in all directions from the initial central point. There is no filamentous fungus, as the Monilia above mentioned, to be found and the delicate tissue abounds in bacteria. The engraving shows the petals of an orchid (Cattleya) badly spotted, as frequently seen in the orchid houses. It is not to be supposed that any particular form or species of bacterium is usually associated with these spots. In fact they can be artificially produced by placing drops of a stagnant water abounding in bacteria upon the petals held in place by bits of thin glass, or without this precaution. Bacteria are in the air as also in ordinary water and the moisture remaining in drops upon the petals furnish the conditions favorable for the entrance of the germs or the destructive effect of the Ptomaine they produce.

A gray mould, usually some member of the genu Botrytis, often begins to disfigure the delicate parts of a blossom very soon after it is fully developed and fragments from such a flower when they fall upon other blossoms carry with them the quickly growing fungus. The spores of the mould may likewise be carried from one flower to another in the water used through the hose or sprinkler. But it is not of these that it is the purpose here to write.

Sometimes the same disease that affects the leaf may flourish in the blossom. There is a bacterial disease of the carnation foliage and the same germ apparently thrives in the bloom, and causes much loss to the grower. Plants that are badly diseased do not have many blossoms, but other neighboring plants loaded with flowers may have the petals badly spotted and blotched with the carnation bacterium. In this case it seems that a specific germ is at the foundation of the floral blight. The petals may be diseased before they have fairly opened out. Similar destruction is met with in roses, the petals becoming spotted while still in the half expanded bud.

BYRON D. HALSTED.

The oldest and best known florist and truckers plant in Southern Kansas; 22 acres, early export to Colorado, Nebraska, etc. Fine cut flower and plant trade. No greenhouse near; 5000 feet glass; steam or water heat; natural gas and water works; 5 acres asparagus and pie plant; 7 room house, large barn, shop, office; live town; healthful climate. Good reasons. Address WILLIAM H. BARNES, Box 845, Independence, Kans.

GREENHOUSE PLANT FOR SALE.

On account of the death of the owner, offer for sale a complete greenhouse plant consisting of a brick dwelling house of 6 rooms, 3 greenhouses with steam heating, barn, ½ acre choice land, good well and cistern, located at Yankton, South Dakota, second largest city in the State; the only business of the kind within a radius of 60 miles. Growing towns all round this city. A splendid business opening for an industrious and competent man. Price, $1,600; one-half cash, balance on time.

AMERICAN STATE BANK, Yankton, S. Dak.

Toronto.

Amongst other orchids, Thunia (Phaius) Marshalliæ is flowering at the Central Prison greenhouses now; it is a most beautiful thing, and Mr. Houston says it is very easy to manage.

Bedding out has been a very slow process this year, on account of the weather, which still remains cold and showery. The thermometer hovers between 40° and 55° descending at night, often to the vicinity of freezing point. The total rainfall during May last at the Toronto Observatory was 9.76 inches. All dealers in plants are doing a lot of grumbling these days, and they have good cause; people are afraid to plant out much till the weather gets more seasonable, and prices are being cut to ruinously low figures. When the warm weather does come no doubt everyone will want things all at once, and there will be a great rush for a few days. "Oh! let it be soon."

We are in the throes of the quadrennial Provincial election just now, so that in spite of the bad weather and the hard times there is no lack of excitement. Although it may not be cold enough to kill coleus on the 26th of June (the fateful day) it will probably feel very frosty to some people, and there will be much snow.

The next meeting of the Gardeners' and Florists' Association will likely be devoted to "business" more than anything else. What has become of the prize list of the Electoral District Society's summer show? Only about six weeks to the usual time of holding it, and nobody appears to have received the list yet. It should be in the hands of exhibitors in March at the latest. E.

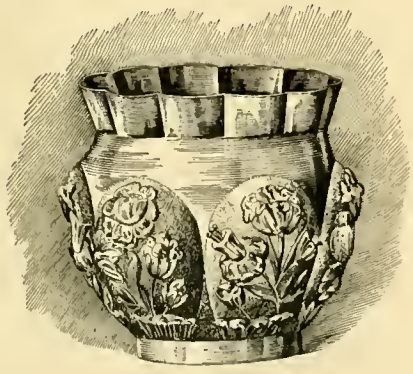
WINTER FLOWERING ROSES

We devote more than half of our greenhouses to the production of Winter Flowering Roses, and have the finest range of greenhouses in this country for that purpose; they contain every improvement in regard to durability and labor-saving appliances; the rafters and purlins are of wrought iron, securing very light roofs and extreme durability. The water is warmed in very cold weather before using by the exhaust steam from the steam-pump that supplies the houses with water; liquid manure is all pumped by steam, and everything to secure the highest development of our stock, and at the least expense, has been sought for and secured, and our new range of iron rose houses, covering two acres of ground, and **devoted exclusively to the production of cut roses,** are conceded by all who have examined them to be without question the finest range of greenhouses devoted to rose culture in the United States, and we believe, in consequence, we have exceptional facilities for supplying strong young healthy rose stock at the lowest possible prices. These houses are worth examination, as they are conceded to be model houses in every way. Visitors are always welcome.

AMERICAN BEAUTY.—The largest rose and the most vigorous growing by far among continuously blooming roses, throwing up very strong stems from the base of the plant, every shoot terminated with a single flower, which is of the largest size. Color, deep rose. In foliage and size of flower it resembles the large Hybrid Perpetual or Hardy class, and is similar to Magna Charta or Gloire de Paris. It is as fragrant as the most fragrant of Hardy roses, which, coupled with its vigor, large size and beautiful color, long stems and continuous bloom, places it at the head of Winter blooming roses. It requires skill and favorable conditions to flower it in perfection, but when successfully flowered no other rose approaches it for beauty or profit. 2¼-inch pots, **$10.00 per 100; $90.00 per 1000.**



MME. CAROLINE TESTOUT.—This rose has attracted more attention than any rose sent out since the American Beauty. It was the winner at the Madison Square Garden Chrysanthemum Show of the LANIER SILVER CUP for the best new seedling of European origin not exhibited previous to 1892, and it was constantly surrounded by an admiring group throughout the show. It is a Hybrid Tea, with a decided, though delicate tea fragrance. It is a very vigorous grower, throwing up heavy bottom shoots in profusion, and is also a remarkably free bloomer for so large and fine a rose, producing scarcely any blind wood. In form it is very similar to La France, and in size much larger. In color it is simply unequalled among pink roses, being of a wonderfully clear brilliant pink, of one solid tone, without shading of any kind. It needs no special treatment, and for a high class rose of easy culture, it is certainly unequalled. Large roses that can be cut in the half-blown state, like Beauty, are becoming yearly more fashionable and the popular taste seems to be growing in this direction; we have needed a good pink rose to meet this demand, and believe that Mme. Testout will fill the bill. Mr. Ernst Asmus says: "This is the best Hybrid Tea the French have ever sent out." Mr. W. W. Coles says: "I have grown many varieties of roses, but have never seen one with so many good qualities as the above. I shall be very much mistaken in my prediction if we do not find, within a few years, that there are a thousand Testouts grown for every hundred La France." Mr. Robt Craig says: "I want to tell you that's a nice thing. The color of Testout is its great point. In that respect it is far ahead of La France. It will keep in the cellar for three or four days, and as the color fades it keeps a pleasant shade." Growers, Retailers and Flower Buyers are alike enthusiastic in its praise, and in our opinion this rose is destined to win a high place and prove very profitable to the grower. First premium awarded us for this variety, N. Y. Chrysanthemum show, Fall, 1893. Price, 2¼-inch pots, **$8.00 per 100, $75.00 per 1000.**

Silver cup awarded us 1891 for our exhibit of Meteor Roses; for best 100 Red Roses of any variety.

KAISERIN AUGUSTA VICTORIA.—A new rose of German origin that is attracting a great deal of attention and promises to be of great value. In color it is midway between Bride and Mme. Hoste, a delicate cream white. The buds are both larger and longer stemmed than those of Bride. The habit of the plant is singularly strong, vigorous and healthy; the flower is most deliciously fragrant. Winner of the Silver Cup offered by the F. R. Pierson Company, at the Madison Square Garden Chrysanthemum Show for the most promising forcing rose never before exhibited at a New York show. First premium New York Chrysanthemum Show, Fall, 1893, awarded us for this variety. Price, 2¼-inch pots, **$8.00 per 100; $75.00 per 1000.**

BRIDESMAID.—(Originated by Frank L. Moore.) This is the rose we have all been waiting for—*a Mermet whose color is constant* through all kinds of weather. Mermet has always been acknowledged as more nearly approaching perfection than any other pink rose, its one fault being its tendency to lose color in dark weather. In the *Bridesmaid* we have it with this one fault corrected, and every good trait unchanged. It is identical in form, habit of growth and freedom of bloom with its parent, and, unlike Waban, it never produces malformed buds. Many of the largest and most wide-awake growers about New York intend to discard Mermet and plant Bridesmaid in its place the coming season, and we believe results will prove their wisdom, as its uniform good color causes it to bring a correspondingly uniform good price, and hence makes it much more profitable. The past winter it has brought fifty per cent more than Mermet; when it is realized that it is fully as free of bloom, no more need be said on this point. We won *First Prize* two successive days at the Madison Square Garden Chrysanthemum Show, fall of 1892, for this variety. Mr. T. J. Slaughter, who has been a large and very successful grower of Mermet, voices the universal verdict when he says: "It gives me great pleasure to give the Bridesmaid my hearty recommendation; from my experience with it this year *I am convinced it will supersede the Mermet entirely*, owing to its better color and greater market value. I intend to give it all the room I can possibly spare. I think growers will go strong for it next year." 2¼-inch pots. **$8.00 per 100; $75.00 per 1000.**

Silver Cup awarded us for Meteor Roses, exhibited at Madison Square Garden, 1892, for best 25 Red Roses of any variety.

METEOR.—The finest crimson rose for winter blooming; very double and very dark velvety crimson scarlet, its only fault being a tendency to become black during the shortest days of winter, but when well grown it is not excelled; a superb variety. We grow this rose very largely, and won a Silver Cup at the Madison Square Garden Chrysanthemum Show, for the best twenty-five blooms, also both first and second prizes for the best twelve blooms. We are recognized as having the best stock about New York, and are headquarters for this variety. In 1893 we again received First Premium for our exhibit of Meteor at the New York Chrysanthemum Show, and also a **Bronze Medal at the World's Columbian Exposition in Chicago,** for our exhibit of this variety. 2¼-inch pots, **$6.00 per 100; $55.00 per 1000.**

SOUVENIR DE WOOTTON.—A very valuable scarlet-crimson, much like Jacqueminot in size and color; an easy variety to flower and has a delicious fragrance. Throws good stems, but frequently in clusters, in which case, by disbudding, the size of the flower is largely increased. The best crimson Winter-flowering rose at the present time **"for general use,"** all things considered. 2¼-inch pots. **$6.00 per 100; $55.00 per 1000.**

MME. CUSIN, PERLE, MERMET, NIPHETOS and BRIDE, $5 per 100; $45 per 1000.

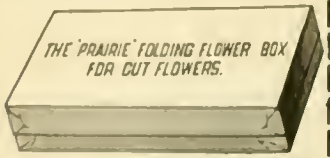
Orders for less than one-half inch space not accepted.

Advertisements must reach us by Monday to secure insertion in the issue for the following Thursday.

Address THE AMERICAN FLORIST CO., Chicago.

WE HAVE RECEIVED from Secretary L. A. Goodman of Westport, Mo., a copy of the 36th annual report of the State Horticultural Society of Missouri. It contains a great deal of matter of interest to the general horticulturist, and there are some very readable essays upon floricultural matters as well. One thing upon which Mr. Goodman is to be especially congratulated is the very full and complete index to the contents of the volume. The secretaries of other horticultural societies would do exceedingly well to follow Mr. Goodman's lead in this direction. There is now buried in the reports of the various horticultural societies a great deal of valuable information that is utterly lost on account of the absence of an adequate index.



THE Montana Agricultural Experiment Station is now fully organized at Bozeman with Mr. S. M. Emery as Director. Mr. Emery is quite well known to the trade through his long connection with the Jewell Nursery Co. of Lake City, Minn. It is not often that an experiment station is fortunate enough to secure the services of such a thoroughly practical and well informed man, and the Montana authorities are to be warmly congratulated. We shall look for numerous reports of real practical value from the Montana station.

THE Herendeen Mfg. Co. has added a new boiler to their list. It is named "Fuhrman, Jr.," and is designed for heating small conservatories, etc., for which the smallest of their old sizes were too large.

DO YOU WANT a list of the leading park superintendents of America? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

Asphaltum on Steam Pipes.

Will some reader of the FLORIST who has had experience in using asphaltum on steam pipes please state through the columns of the FLORIST its effect on plants and roses. Also, does it act in any way as a non-conductor of heat? Would you advise using it? A.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 114 Chambers street, New York.

The Seedsmen's Convention.

Taken all in all the Toronto convention was one of the strongest and best attended in the history of the American Seed Trade Association. Over twenty new members were admitted during the morning session Tuesday.

The following were present: President W. Atlee Burpee and wife, Secretary A. L. Don, John H. Allan and wife, Henry Phillips and wife, S. F. Willard, S. W. Flower, F. Griswold, S. E. Briggs, W. H. Marcon, T. W. Wood, Irwin B. Clark, Frank Ford, R. C. Steele, H. M. Wall, F. A. Stecher, J. E. Northrup, C. S. Burge, E. V. Hallock, S. Y. Haines, F. T. Emerson, Geo. Crosman, W. W. Rawson, Walt Simmers, S. M. Pease, F. S. Platt and wife, E. M. Parmelee, A. N. Clarke and wife, E. B. Clarke and wife, W. Langbridge, J. B. Rice and wife, S. D. Woodruff, L. Morrison, C. L. Allen, H. M. Clair, E. W. Burt, W. H. Grennell, Wm. Rennie, F. W. Barteldes, H. A. Johns, R. Engelman, A. Currie, J. T. Huntington, E. H. Hunt, Thos. M. Hunter, Col. W. S. King, Geo. S. Green, Chas N. Page, M. Fell, C. P. Braslan, J. C. Vaughan, D. I. Bushnell wife and son, J. Chas. McCullough wife and child, A. J.Brown, W. S. Hammon.

Among new members admitted were Geo. Keith, William Rennie, E. H. Hunt, William Eber & Son, Thos. Emerson, S. H. Downs, Cratz Bros., Morehouse & Co., Rademaker & Co.

On Tuesday an interesting paper on "Root crops" was read by S. E. Briggs of Toronto. It will be published in our next issue.

On Wednesday, on the invitation of the Toronto Seed Trade the entire party embarked at 11:30 a. m. for a two hours ride on the lake, returning at 2 p. m. for luncheon at Webb's. Following this the City Council gave the party an extended carriage ride through the parks and beautiful drives of the city.

THE FOLLOWING PARTY left Chicago Sunday night, June 10, for Toronto: F. W. Barteldes, H. A. Johns, R. Englemann, A. Currie, J. T. Huntington, E. H. Hunt, Thos. M. Hunter, Col. W. S. King, Geo. S. Green, Chas. N. Page, W. Fell, Chas. P. Braslan and J. C. Vaughan. On arriving at Detroit at 8 a. m. the delegation breakfasted at the Cadillac, where they were joined by D. I. Bushnell, wife and son; J. Chas. McCullough, wife and child; A. J. Brown, W. S. Hammon of Kansas City, J. M. Phillips of Toledo. After visiting the local seedsmen the entire party left at noon via the Canadian Pacific for Toronto, arriving there (Queens Hotel) at 9 o'clock Monday night.

F. W. BARTELDES & CO., at Lawrence, are doubling their storage room, adding a 3-story warehouse 50x110 feet. At one end of the building will be placed a panel bearing the Barteldes escutcheon, a "Long Green" rampant, with the motto above, "Put it on the loft." The date of the dedication has not yet been fixed, but due notice will be given.

THE ONION SET crops in the vicinity of Omaha and Kansas City are looking fairly well, although the yield will be a little shortened by the drought.

T. LEE ADAMS left last week for a five weeks trip to California.

THE N. B. G. Co. at Chicago have doubled their floor space for storage.

THE NEW SWEET PEA Blanche Burpee is not likely to be placed on the market until 1896.

ALFRED UNGER, of Yokohama, Japan, passed through the States last week on a trip to Europe.

MR. HENRY A. SALZER and Mr. Chas. P. Braslan expect to make a trip to Europe, sailing about July 10.

MR. JOHN BUCKBEE of Rockford, Ill., is visiting Washington and other eastern points and will sail from New York for a European trip the latter part of this month.

F. BARTELDES & Co. have purchased a controlling interest in the Trumbull, Strean & Allen Seed Co., Kansas City, Mo., Messrs. Strean & Allen retiring. It is reported that the business will be continued under the name of the Trumbull Seed Co. Rumors of an export house in New York in this connection, are floating in the air.

U. S. Department of Agriculture.

WHAT A CONSTITUENT NEEDS.

Rather a funny letter was read to the house yesterday by Representative Pickler of South Dakota, while the agricultural bill was under consideration, says the Washington *Post*. Mr. Pickler has a constituent named James Wells, living at Britton, S. D., and Mr. Wells, or rather Mr. Wells' wife, wants some garden seeds. So he made his appeal in the following words:

I would like some seventy-day corn, and if the new administration has any new silver seed that will produce standard silver dollars or even Mexican dollars in about sixty days I would like some of that. Our land is well adapted to the raising of silver. We would like something that would yield 1,000 bushels to the acre and sell for $1 a bushel. We have not farmed much, but are looking for anything new or profitable. Some of our friends say German carp is a good crop. We will put in a few acres of carp for a starter if we can get the seed. Some of our kind friends recommend ostriches, but they grow so few in a hill that we will not venture to try them. There is a small lake near our farm and my wife is anxious to raise some gondolas. They are an Italian bird, I believe. The climate here is severe, but she thinks she could raise them by keeping them near a hard coal burner in the winter season. If Mr. Morton could be prevailed upon to send us a pair of young ones we would esteem it a great favor. We could use some canvas-back duck seed to good advantage. We want to try some hard coal seed this year, as we have paid $10 a ton for coal about as long as we care to. One of my young sons has a desire to raise a pair of elephants to break our land with. Do you think Mr. Morton would be willing to send us a couple of elephant eggs to try the experiment? Some of our advanced thinkers advise me to raise a crop of plug tobacco. In selecting seed I wish you would send "Spear Head," "Climax" or "Star." The climate is too dry for fine cut. If the department has anything new in jack rabbits I would like a few vines that would bear the second year.

DO YOU WANT a list of firms in the trade that issue catalogues, with key showing proportion of space given each branch of the trade in same? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

COLEUS.

25,000 COLEUS, VERSCHAFFELTII and GOLDEN BEDDER (true); 10,000 COLEUS, assorted, in 50 varieties, fine plants, pot grown, ready now, $20.00 per 1000. Cash with order.

C. F. FAIRFIELD, Florist,
SPRINGFIELD, MASS.
Mention American Florist.

Grow Swainsona.

The best and most profitable pure white flower grown. Takes the place of Roman hyacinths or lily of the valley, producing spikes of flowers from 4 to 6 inches long, in the greatest abundance the entire year—never out of bloom—lasting well when cut. 100 Swainsona will pay you three times as much as same space in best carnations. No florist should be without this most useful flower. After a trial it will be considered indispensable.

EASY TO GROW.

An exceptionally good and paying cut flower.

Strong young plants, $6.00 per 100;
$1.50 per dozen.
Larger ones, $10.00 per 100.

WINTER FLOWERS

With the present low prices of Bulbs and the increasing desire for flowers among people, a great deal more ought to be done in the Bulb line.

Ten Bulbs of one variety of Hyacinths or Tulips in a pan make desirable window decorations and give a big show for little money. Large quantities of these pans are disposed of in the Boston and New York markets throughout the winter and spring.

Fitted into pretty celluloid baskets or other receptacles and encircled by ribbon of appropriate color, they are great favorites in New York City as Easter gifts.

In nearly all the largest cities the parks have been planted with spring Bulbs, this should also be done in private gardens. Nothing is handsomer on the lawn than a well arranged bed of Hyacinths, Tulips or Crocus.

It is a favorable opportunity for Florists to drum up a trade in this line.

SEGERS BROTHERS,

WHOLESALE BULB GROWERS,

A few hundred Roses—Meteor, Perle and Hoste, 3-inch, ready for a shift, $6.00 per 100.

JOSEPH E. BONSALL, Wholesale Florist, Salem, O.

St. Louis.

The weather continues to be quite warm and dry. Outdoor stock of all kinds is suffering for lack of moisture, this having been the dryest spring known for several years. Planting out and the spring plant trade are about over, and have not averaged so poorly as was expected. Cut flowers have held their own during the week, being in short supply on several days. The almost universal request made by schools and institutes that flowers be not presented to graduates has had quite an effect on trade; one firm in speaking of the matter estimates the loss to the florists to amount to $5,000. This feature has been steadily growing for some years past; it is to be hoped however that a change will come in a short while.

The handicap meetings of the Bowling Club are proving very interesting. At the last meeting Robert Beyer made the highest score of the present series, having 264 pins to his credit. R. F. T.

A Decision Reversed.

The decision announced on page 1,000 of our issue for May 17 in the case of Krick vs. Jansen has been reversed by the U. S. Circuit Court of Appeals for the second district. In concluding his decision upon the appeal by Mr. Jansen the court says: "We do not perceive in the floral letter with the holes, notwithstanding its popularity, a patentable improvement upon the wooden cross or wreath. This result obviates the necessity of examining the question of infringement. The decree of the Circuit Court is reversed with costs and the case is remanded to that Court with instructions to dismiss the bill with costs of the Circuit Court."

Grafting Extraordinary!

The *Boston Globe* has found out how it is done and prints the following description:

L. F. Seaver of North Somerville, who is popularly known as the pansy king, had on exhibition at the last display in Horticultural hall some exquisite double ruffle pansies. Mr. Seaver is the first man who ever produced these pansies. He obtained the result by grafting a rose on a pansy plant and bedding the plant in pulverized charcoal and blood.

No wonder the pansies had double ruffles. Such a graft should have produced flowers ruffled, fluted, pleated, and cut low enough for evening wear.

AMERICAN GROWN DUTCH BULBS.

To introduce my American grown Narcissus for forcing by florists I make the following special offer. *Bulbs ready now.*

	Per 100
NARCISSUS CAMPERNELLE, - -	$.75
DAFFODIL RUGILOBUS, - - -	1.50

I would like to correspond with any one desirous of going into the business of growing Dutch bulbs in America. I have a stock of 100,000, in 10 to 18 varieties.

South Carolina is the very best section of the U. S. for the growing of these bulbs. I have successfully demonstrated this, and can offer a splendid opening to a man with some capital and familiarity with horticultural work

MRS. J. S. R. THOMPSON,
. . . SPARTANBURG, S. C.

Our buyers will visit Holland, Southern France and Bermuda during the month of June, and orders placed with us now will have most careful personal attention by them.

IMPORT BULB PRICES.

ROMAN HYACINTHS, and all French Bulbs.

Rooted Cuttings and Young Plants sold out. Nice Field-Grown Plants in Sept. Send for prices.

GEO. HANCOCK & SON, Grand Haven, Mich.

Cincinnati.

The florist cannot complain of slow business this week, as everything in the shape of flowers has sold well. The wholesale houses have not been able to fill orders, and the retail trade has been booming. Wedding decorations and funeral work seem to have the lead. Fred Walz had a nice decoration at the Grand Hotel on account of the state meeting of druggists. Julius Baer has several nice wedding orders. Chas. J. Jones, Jr., reports a good trade at both of his establishments, having recently built a greenhouse and store on East Walnut Hills; he also has quite a trade in bedding plants. B. J. Glins of Cumminsville, who has six houses 16 by 60 feet, reports a splendid trade in miscellaneous stock. Decoration Day took all the blooms that were in sight.

We have one firm here who makes a specialty of forcing lily of the valley, and exhibits untold energy to fill orders. One day this week, having a large order for valley and getting a little nervous regarding getting same in, they adopted this plan: Setting the boxes containing the pips on the steam pipes Ben lighted two coal oil lamps and put under said boxes, then he placed two chairs with a board on same, and we will say a rock under his head for a pillow. On this contrived bed Ben stretched out and with warm water sprayed the valley all night. He filled his orders. Should any person disbelieve this story he can address Ben George of the firm of Magree & George, College Hill, O.

We also have quite a number of the boys who like a horse race quite as well as a flower, and most any afternoon you can see them going or coming from the Latonia race course; "of course they would not bet on the races."

Our flower market is a grand success; most any Saturday afternoon it looks like a flower show. Inside this market are thirty-nine stands stationary, and space for ten or twelve through the middle. At present there are forty-three florists occupying space in said market. They pay an annual rental of from twenty to forty dollars per stand. This money goes to paying the superintendent's salary, and other necessary expenses. The superintendent is in uniform, and with police authority, so the boys keep pretty straight.

The appraisers in the Critchell assignment have finished their work, and it is to be hoped that Mr. Critchell will be on his feet again in a short time.

Visitors in the city this and last week were as follows: E. G. Hill of Richmond, Ind.; John Bertermann of Indianapolis; John Lodder of Hamilton, O.; Fred Weltz of Wilmington, O., and J. H. Bowers, Hillsboro, O. All these gentlemen have good reports to offer for the year's business now ending.

Quite a number of florists from Cincinnati will attend the meeting of the S. A. F. at Atlantic City. We already have very good rates offered, and should like to hear from any brother florist in our territory.

AUGUST BECKER,
Lexington, Ky.

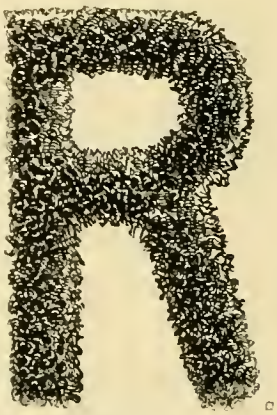
Cleveland.

Among some of the choice decorations done this spring mention might be made of an elegant dinner at an uptown residence. The table was very large, being some thirty feet long and oval. In the center was placed a round basket of pink pæonies and marguerites, radiating from which were garlands of pink roses and marguerites, oval in shape and extending the full length of the table. These garlands were tied at either side with wide bows of pink ribbons. The effect of the whole was beautiful and chaste in the extreme.

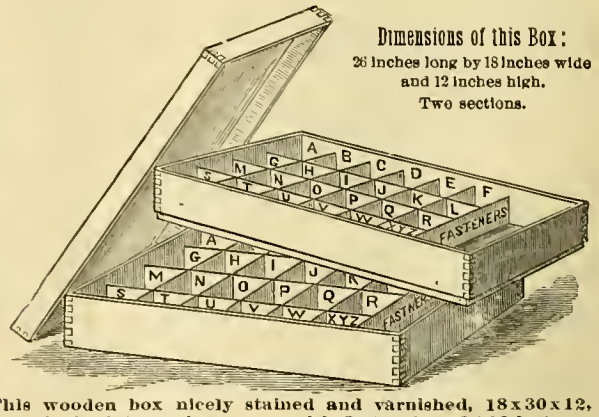
At the wedding of Miss Cady the church and Stillman hotel were elaborately decorated. The bridal party received in a floral bower composed principally of roses. The dining room was decorated with Watteville roses, there being a large center piece of this rose, and small crescents of the same strewn carelessly over the cloth.

One of the odd and beautiful (?) designs lately called for was a pugilistic arm in a *striking* attitude. This was of gigantic size. It was made of Daybreak carnations, and rested on a bed of ferns—it was used for the dinner of an athletic club.

Mrs. Hanna of Lake avenue gave a reception this week, at which the floral decorations were on a lavish scale. The house throughout was decorated with palms, roses and orchids. There were some superb Beauties with five foot stems arranged carelessly in vases. On the lawn was a large tent used for refreshments, filled with small tables, on each of which was placed a vase of mountain laurel. The poles, cordage, etc., were festooned with laurel and wild flowers. About four hundred pink and white pæonies were used; these are now in their prime.



It was conceded to be the finest decoration seen about here in years, and society was loud in its praises. In one room the walls were festooned with wistaria, and in another the common yellow rose so often seen in old fashioned gardens was arranged in a careless band around the walls, which had the desired effect of a natural border of roses. In another room Marechal Niels were used for festooning and running up over the curtains; this was a most beautiful and graceful arrangement and quite a number of the guests at first thought the plant was growing there naturally. This was attained by cutting down whole plants of Marechal Niel which were in full bloom at the time.



Children's day in the churches was generally observed, and all the larger churches were decorated with palms and loose flowers. At the old Stone church each child was given a chrysanthemum plant with printed instructions how to grow it.

The voice of the sweet girl graduate is heard in the land, and the heart of the florist is warming up to his oldtime gladness. Business has improved considerably of late, but it will be of short duration, as we consider the season over by the 20th of this month.

D. Charlesworth has the contract to do some fancy bedding in the public square; he is putting in some G. A. R. designs, etc., around the Soldiers Monument. We doubt the wisdom of this move, for the conditions are anything but favorable for plant life there, being entirely too much smoke and gas in the heart of the city for any kind of vegetation. Even the trees lose their beauty by the middle of July.

JOHN G. ESLER, Sec'y, F. H. A., Saddle River, N. J

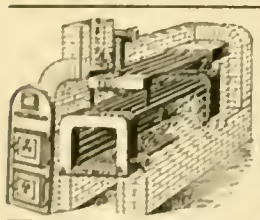
Montreal.

The Executive Committee of the Gardeners and Florists' Club are hard at work upon the prize list for the chrysanthemum exhibition. This year we are intending to try something entirely different by issuing the premium list in neat book form and introducing a few short but practical essays upon the general culture of roses, carnations, chrysanthemums, house culture of palms, house culture of bulbs and the like. This should prove of great interest to the amateur and will be a considerable improvement upon the old form. This will also prove a good medium for advertising; it is proposed to place certain portions of space at the disposal of those who may see fit to take advantage of it. These it is intended to distribute all around the leading horticultural centers on the continent. As our whole list is this year thrown open to all comers we hope to have keen competition from across the line as well as from our sister province. Lots of mums are being grown again this year and we hope for a far larger show than was ever brought together before.

For our picnic trip this year we are again to take a sail up the river to Sherringham park and expect to have a right good time of it. H. STOCKING.

DO YOU WANT Mr. Scott's seasonable hints for the year in book form, so that you can refer readily to his suggestions for any week in the year? You will find them in this form in our trade directory and reference book for 1894. Price $2.00.

THE KINNEY PUMP.



THE KINNEY PUMP.

Every florist, market gardener, owner of lawn, grass-plat or flower-bed, in fact everyone who has a faucet and hose should have the Kinney Pump (patent applied for) for applying liquid manure, fungicides and insecticides to plants. Feed your plants, fertilize your lawns by using liquid manure. The cheapest, simplest and most scientific spraying pump in use. Sent prepaid for $2.50—spraying valve attachment 50c. Pump complete $3.00. Send for circular. Address

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.
Send for price list and samples and we know you will give us an order.

TO TAKE PLACE OF WIND MILLS

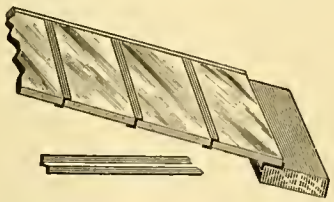
HOT AIR PUMPING ENGINES

A Windmill

Is unreliable because it de pends upon the element for its power; hydrauli rams also depend upon fav orable conditions and waste as much water as they se cure. Steam pumps requir skill and hand pumps de mand labor and time. The

DE LAMATER-RIDER OR DE LAMATER-ERICSSON Hot-Air Pumping Engines

are especially designed for pumping water, and from shallow streams or any kind of well. They are simple, safe and reliable, require no steam and have no valves. They require very little heat to operate them, and can be arranged for any kind of fuel.



Send for illustrated catalogue to

THE DE LAMATER IRON WORKS,

87 South Fifth Av.,

NEW YORK, N. Y.

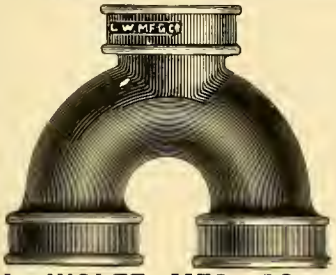
IMPROVED GLAZING.

GASSER'S PATENT ZINC JOINTS for butting glass makes greenhouses air and water tight; also prevents sliding and breakage from frost. Does not cost as much to heat a house glazed with the joints, thereby saving enough in fuel to more than pay the additional cost of glazing. The leading florists of the country are using them. Write for circulars with full particulars and price list.

J. M. GASSER, FLORIST,

Euclid Avenue, CLEVELAND, O.

THE CHAMPION Automatic Ventilator.



The cheapest, easiest to operate, and by far the best machine in the market. Don't buy a Ventilator until you have seen my illustrated descriptive circular, which will be sent you free, giving prices, etc. Also Champion Soil Pulverizer and Sifter.

Address, **E. E. WOLF,**

Chrysanthemum Notes.

By the time that this article is in the hands of its readers, the chrysanthemum plants will be set out, and most of them will have become established in the benches, but don't for a moment think that you have got through with your work, and that they will take care of themselves, for nothing truer was ever said than that oft-quoted remark of our esteemed friend John Thorpe, "Eternal vigilance is the price of good chrysanthemums." The child is really in but its swaddling clothes, and will need close watching and careful attention from now on to next November, in order to have it shine with its competitors. After the plants are set out give the benches a good watering, and then for a week or ten days keep them a little dry, so that the roots will take hold. We do not mean by this to allow them to get so dry that they will wilt ever so little, but do not water enough to sour the soil, or root action will be retarded, and the lower leaves will turn yellow; damage will then have been done that will be irreparable, for from now on be very careful and do nothing that will give the plants any serious check.

If any shade was placed upon the houses during planting time, or previous to that, remove it at once, and let the plants make their growth in the full sunlight. We do not believe that chrysanthemums should be grown in the shade. In making this assertion we are influenced by their manner of growth in the eastern states. It may be possible that there are more sunny days throughout the summer in the central states, and we have it on very good authority that there are more bright days in the western country than in the east, and a slight shade may be to the plant's advantage, but certainly the mercury runs just as high here as it does in other parts of the country, and we do not know a grower who shades his chrysanthemum houses during the summer months. The plant grown in the full sunlight will be much sturdier and shorter jointed, and will not have the long-jointed stem sparsely covered with foliage of the plant grown in the shade.

We know it is very hard to make the American people keep a diary, but we believe every grower should keep a book into which he can make notes on the growth of his plants, and if you have one or two varieties that do exceptionally well you will then have something which you can turn to that will tell you how it was done. Too many growers trust altogether too much to their memory, and if you ask them how they procured such beautiful blooms of this or that variety, they will answer you in a very general way, that they took the cuttings about such a time, and the bud was taken, if they know at all, about such time. Now if they had put down the dates of these occurrences when they happened in black and white they could, if they so desired, tell you exactly how those blooms were produced, and at what day of the year everything important in the life of those plants occurred. The Hertford Horticultural Mutual Improvement Society published this year a book entitled "The Chrysanthemum Grower's Record" which just fills the bill for an extended and detailed memorandum, although it would require some alterations for growers on this side of the water. Each page is lined and divided into spaces for dates to be written, and the spaces have the following headings: Name, description, cuttings, inserted and rooted, potted into the dif-

ferent sizes of pots, stopped, 1st break, 2d break, buds visible and taken, crown or terminal, commenced feeding, color showing and fully out, height, housed, number of shoots, soil used, and remarks. It will not, perhaps, be necessary to go so much into details as this, but at least make a record now, of when the cuttings were inserted and potted and when planted in the benches, and next August when you go to the convention be sure and attend the meeting of the Chrysanthemum Society of America, and meet the prominent growers of the "Queen of Autumn" who will be there, and give them a little of the knowledge you have acquired and learn as much more from them.

West Newton, Mass.

Orchid Notes.

Sophro-Lælio Veitchi. This wonderful new bigeneric hybrid, flowering now (May 26) for the first time in the United States is another of Messrs. Veitch's marvels, and for richness in coloring easily surpasses anything hitherto introduced. It is interesting owing to its being the first hybrid raised between Sophronites and a Lælio-Cattleya, the parents being Sophronites grandiflora? × Lælio-Cattleya Schilleriana?. Sophro-Cattleya Batemanniana rosea is beautiful, of pretty shape and soft delicate rose coloring. Sophro-Cattleya Calypso has larger flower of better shape and substance and the whole flower uniformly suffused with rich rose, but Sophro-Lælio Veitchi has flowers as large as Lælia pumila with the deep rich color of Sophronites grandiflora rosea through the whole flower. I have no doubt when the plant gains strength the flowers will be correspondingly larger and the color even more intense. It is indeed a wonderful plant and worthy the name.

Lælia Latoni, another Veitchian hybrid, the result of crossing Lælia cinnabarina? with Lælia purpurata? is a plant of good habit and novel in color. The sepals and petals are intermediate in size between the parents, of a rich color partaking more after the seed parent, larger, fringed with rich purple, and the spike carries six or seven flowers.

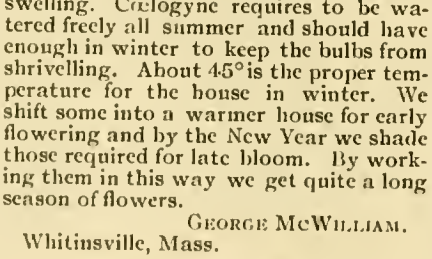
Another hybrid which has flowered with us at this time is Lælio-Cattleya Phoebe sent to us by F. Sander & Co. and supposed to be a hybrid between Cattleya Mossiæ ♂ crossed with Lælia cinnabarina♀, thus being the reverse of Lælio-Cattleya Hippolyta. It is a handsome plant and in every way superior to Hippolyta, but it approaches very near to Latoni. The coloring of sepals and petals is much lighter orange. The plant has a good constitution and will grow and flower freely in an ordinary cattleya house, kept well up to the light with partial shade from mid-day sun.

Cattleya Philo is a remarkable hybrid, the result of a cross between Cattleya Mossiæ and the extremely rare Cattleya iricolor, and consequently the first hybrid raised from that rare species. The pollen parent has exercised a greater influence on the coloring and markings of the flower. It has a good constitution, is free flowering and throws the flowers well above the sheath, and lasts long in perfection, flowering all through the month of May. It is another of Mr. Seden's hybrids. There is another form which we have not yet flowered, called Cattleya Philo albiflora, which grows equally free and should be equally handsome.

Cattleya iricolor. This rare species is now in flower, and probably there are not more than half a dozen plants known. It was introduced about twenty years ago, and Messrs. Veitch acquired the stock and sold one plant to the late Mr. Ames, and one to the late Mrs. Morgan which finally got into Mr. Corning's collection at Albany. It carries about three blooms on a spike, flowers three to four inches across, creamy white, lip three lobed, milk white with a few purple streaks with a transverse orange band at the base, on each side of which is a purple blotch. It is a very distinct cattleya having short stems and long leaves, hanging very graceful, and the flowers last long in perfection.

North Easton, Mass. WM. ROBINSON.

Cœlogyne cristata.



Cœlogyne cristata and its varieties alba and Chatsworth are among the best of all orchids for cut flower purposes. I know of no plant that will produce so much flower in the same amount of bench room. We grow them in fern roots and turfy loam with a little sphagnum and broken crocks mixed in, and with plenty of drainage. We start them in pots, but when they need shifting into anything as large as 8 inches or over we always use pans. The plant shown in the illustration was grown in a 15-inch pan.

They are grown in a span roofed house, on the side bench, with top and bottom ventilators open day and night all summer, excepting when cold rain storms come up. From the time the plants start into growth we shade the house until the bulbs commence to swell, which is usually about the last of August. We then wash the shading off, put up a cloth arranged so it can be drawn up or down, and by letting the sun at them gradually they get in eight or ten days so that we can take the cloth away and give them the full sun.

We give established plants weak manure water during the time the bulbs are swelling. Cœlogyne requires to be watered freely all summer and should have enough in winter to keep the bulbs from shrivelling. About 45° is the proper temperature for the house in winter. We shift some into a warmer house for early flowering and by the New Year we shade those required for late bloom. By working them in this way we get quite a long season of flowers.

GEORGE MCWILLIAM.

Whitinsville, Mass.

Carnation Notes.

In my last article I gave a few ideas about building carnation houses. After the houses are built the question comes up, how to heat them.

There has been described in the FLORIST several times a combination of flue and hot water that gives very good results, is cheaply built and easily managed. It has however, one very serious drawback, and that is the inability to properly regulate the temperature of your houses. The weather may be very cold and cloudy, so cold that you will have to fire strong as you can to keep the house warm; suddenly the sun comes out and your flue and the water in your pipes are hot and will stay hot for from three to five hours. The sun is making heat enough to keep your houses right without any artificial heat and you are left with the choice of two evils, either to open the ventilators and admit freezing cold air on the plants to reduce the temperature, or have the houses entirely too hot. With hot water you are often placed in the same position, and the better plan is to have steam and you will then have no evils to choose from. With steam in cases like the above the pipes can be shut off and the temperature kept under control without opening the ventilators.

There are boilers on the market now with which one can fit up a single house or a dozen without much trouble, and with the self regulating and self feeding arrangements attached they are as easily managed as a furnace and flue or hot water boiler. Any good steam fitter should be able to fit up your place in first class style, but it is well to have an iron clad contract with him to heat the place right and then let him get every thing fitted up several weeks at least before you want to plant the house and give the thing a good hard test, so that in case there are some things want changing you will have time to change them before you are caught with the house planted and probably want the heat.

The following system has worked very well for me and may be interesting to some of the carnation growers making changes; I do not claim it to be perfect in all details, but it answers the purpose and does it well.

The boilers are placed about two feet below the lowest return pipe; they are forty horse power with a grate surface of twenty-five square feet. This grate surface is larger than is usually allowed but it is a decided advantage in the way of economical and easy firing. They are all connected below the water level and the steam is all fed into one large receiving pipe. This plan gives an opportunity if one of the fires gets low or from any cause the steam goes down in one boiler for the others to help keep up the quantity needed for the receiving pipe and nothing suffers. They are, however, arranged with valves to run each separately if necessary. Starting from this receiving pipe are two feed pipes, one for one set of houses and the other for the remainder; this divides the place into two distinct systems.

For the three-quarter span houses which form one system (the farthest one of which is 300 feet from the boilers) we take a three inch feed pipe, running it up to the highest point at once and then giving it an incline to the farthest house of about six inches; from this feed we take seven one and one-quarter inch pipes for each house. These pipes are all given a slight incline to the opposite end of the house where they drop into a return; this return is inside of the house and is used as a heating pipe, helping to equalize the temperature at the far end of the house from the feed. Each pipe is fitted with a globe valve at the feed end and a check at the other, so they can be entirely cut off, and one pipe or the seven be used to the house. It is only very cold nights

CŒLOGYNE CRISTATA

that the seven are used to keep the temperature up to fifty and fifty-two degrees.

For the other block of houses the same system is used, the feed pipe being run at once to the end of the houses farthest from the boilers and from this feed are taken sixty-four one-inch pipes for the houses; these are run into a return at the opposite end of the houses same as in the three-quarter span.

The feed pipes and the returns are fitted with valves near the boiler, so that in case of a break anywhere it is the matter of a minute to turn the steam off and fix it up quickly. There is this one thing about steam; you should have an outfit of plumbing tools on hand and be ready any time to fix up a pipe in a hurry, as there is a liability of a break any time.

This system of piping a place with all flows and no returns may not be as good as the flow and return method, although I do not see why it should not be, and it will save according to the size of the house from one to three run of pipe, and that is an item these hard times.

ALBERT M. HERR.

Carnations in Pots.

At the meeting and exhibition of the American Carnation Society, to be held in Boston next February, there will be competition for premiums for carnation plants grown in pots. The A. C. S. at its meeting held last February at Indianapolis instructed the committee having the adoption of a schedule in charge to offer a number of premiums for pot plants, the idea being to encourage this mode of growing the carnation, and an excellent idea it is. In this part of the world apparently we can form no conception of the possibilities of this branch of carnation culture. Hitherto little or no effort has been made to cultivate the plants in pots the year round, the general practice being to select a few, or many as the case may be, at lifting time in autumn. But this plan will hardly do in the future, I think, at least for exhibition purposes.

Quite recently I read in the London *Garden* under the head of "What is a tree carnation?" that "Pride of Penshurst" always flowers most freely with age, and never seems to attain to its best till the second year. Quite a number of florists in this country have had some experience with this variety. On account of its color (a pretty shade of yellow) it was tried quite extensively on its appearance as a novelty, but was dropped almost completely after the first year's trial because it flowered only in the spring. A variety to become popular in America must be profitable. We have neither the time nor the space to devote to varieties which flower only in the spring months. The writer of the article referred to proves to his own satisfaction that Pride of Penshurst is a tree carnation, but he admits that "It is not a good winter variety, and after November does not come kindly, but for autumn and early spring it is excellent." But the most interesting statement to me is this; "I have grown the same plants of Pride of Penshurst continuously in pots for four successive years, during which time they have been repotted only twice. At the end of that time the plants are between five feet and six feet high, not lanky or drawn, but full of fresh vigorous growth." Plants the same size as those, well flowered, would certainly create a sensation if exhibited in any city of America, and if the A. C. S. may only be the means of bringing about plant growing in pots, similar to what they are doing on the "other side" much benefit to carnation culture will, I believe, be the result. And in the same article, speaking about the variety "Andalusia" it is said "That it has never given him any trouble, as it roots very readily from cuttings, and in two years grows into a grand bush five feet high." And our ancient acquaintance "La Belle," which was so extensively advertised about the years 1874-5 as suitable to the needs of this country, is said to attain to the height of 15 feet when grown in a cool conservatory. Imagine a carnation fifteen feet high. Evidently we, the florists of America, have discarded some of the old varieties too soon, before we had, as it were, given them half a trial. This section of the Dianthus Caryophyllus, according to the writer of the article, seem to require age in order to bring out their true character. The new English variety, "Uriah Pike," is also brought in to illustrate the point of the *tree* character of this section of the divine flower. A correspondent in a previous issue of the *Garden* had observed that "If dwarf it would add a good crimson." Whereupon "E. J." rejoins, "This splendid variety is, however, like all good perpetual carnations, only dwarf in youth, while old plants will reach four or five feet quite easily.

I like the vigorous style of "E. J." He is evidently a good grower of plants and knows what he is talking about, that is, of course, as regards the climate of Great Britain. He goes on to say: "I am inclined to believe, however, that much is lost by discarding these plants too early. Of course if only small dwarf plants are required it would be folly to utilize space otherwise, but if the object is cut bloom, and this in quantity, the old plants are especially valuable. Even Miss Jolliffe, when it can be induced to live, produces far finer flowers and in greater number in the second year; indeed it is not too much to say that in size they are nearly double, while the color is much heightened." If we, the florists of America, can only double the size of our flowers, heighten the color and increase the number there are lots of us who would only be too happy to be able to do so.

No plant, I believe, is so susceptible to its surroundings as the type of dianthus under consideration, and it is probable that what is so thoroughly a success in England may be an utter failure with us. However, it seems to me to be well worth while giving the plan, as adapted to the English climate, a trial here, if only in a very moderate way. E. L.

Carnations in Pots.

"E. J.," Pittsburg, Pa., says he "has some carnations lifted last fall. This spring he did not plant them out, but plunged the pots in the earth and wants to manage them so that they will be nicely in bloom by next April." This is growing them nearly or quite two years, altogether too long to be profitable. If they were good plants this spring and had not flowered all winter they should have sold well for bedding, for that kind of carnation plant is always in good demand. It would pay better now to plant them out and use the flowers this summer, and let the old plants stand the chance of living or dying next winter. They will have paid well enough. To have good salable carnation plants in April lift some medium sized plants from the field the same time you are lifting for the benches, pot them in 5-inch pots firmly and place in a well built cold frame. Leave them uncovered as long as possible, but during very cold weather double sash will pay. Bring into the houses at end of February or early in March and they will be most satisfactory either for the flower border or for pot plants. Pinch off all leading shoots in the fall when lifting. WM. SCOTT.

WE HAVE received from Mr. H. E. Goold, Sussex, N. B., a few blooms of a seedling daisy grown by him. The flowers arrived in very good condition after their long journey by mail and the variety seems quite promising.

Marketing Pæonies.

This is the season for pæonies, and thousands of blooms are received daily at the large distributing centers all over the country, but of the vast amount of stuff sent to the markets there is a very large percentage totally unfit for sale, and in many instances consignments received from a distance do not realize express charges. Nine times out of ten the trouble is either bad packing or worse judgment in cutting the bloom. Wholesale and commission men have been wrestling with this question for a number of years, and their individual efforts to educate the shipper up to the fact that it is fully as important to exercise good judgement in cutting pæony blooms as those of the rose, has borne some fruit. But there are still too many growers of these flowers who do not yet realize the importance of this matter. Many thousands of pæonies could often be sold at a very good price if they were marketed in salable condition.

The meagre returns realized from this class of stock has discouraged many growers from shipping at all, allowing the bloom to go to waste. Take for instance last Decoration Day; at that time the Chicago market was depending for its supply of pæonies on points further south, the home grown article not being in yet. Prices were up to the top notch, and growers of these flowers, say in Southern Illinois or Indiana, could have reaped a rich harvest, if they only had known how to handle their stock to advantage. The idea that seems to be prevalent is to allow the flower to fully expand, then cut it, and rush it to the market at once.

Now let us note how some of our most successfull pæony growers handle their stock. There are in our vicinity two growers in particular who have given a good deal of attention to the pæony for a number of years. The first and oldest is the Kennicott establishment at "The Grove" started many years ago by Dr. Kennicott, who in his day was noted as a very able horticulturist. The place is now managed by one of the sons, Amasa. A great deal of the stock now grown around Chicago was disseminated from this establishment. The other establishment is that of the Klehm Nurseries at Arlington Heights. We paid a visit to this latter place last week, in the first place to gather information, and in the second place to enjoy the sight of the pæony field. The information on points of interest was freely imparted by our genial hosts, father and three sons. But the visitor who expects to see a great sight of gorgeous blooms will be sorely disappointed. Although this is the height of the season, when from one to two hundred dozen flowers are cut daily, you will not find a single open flower, unless it be of some worthless variety, and few of those are tolerated. The rows are yet a sea of buds, but these are kept under as careful surveillance as an experienced rose grower would use in watching his buds. An experienced hand is kept busy all day in cutting the buds at the right stage of development. The man who cuts pæonies must have a knowledge of the habits of different varieties, and use good judgment just the same as the rose grower.

Let us take some of the leading commercial sorts, starting with the earliest varieties. The first to come is the old European species P. officianlis rubra, commonly known as "Old Red;" this sort has always been a prime favorite in the market, and is sold in large quantities, at the same time it is one of the most difficult varieties to handle, as it is a very poor keeper. The blooms of this variety, if left to expand on the plant, will scarcely keep a day, but if cut while yet in close bud will last 3 or 4 days, or even longer, in good condition, and not alone will the flowers last longer, but if kept set in a pail of water in a cool basement, the bloom will develop larger and finer than they would if allowed to mature on the plant. The pink form of this same species (officinalis carneus) is of the same habit, and should be treated the same as the former. This sort appears to be, in our locality at least, more tender than old red, the blooms too being weaker and smaller, and on that account not as profitable to grow.

In the Chinese section the early white (Whittleji) is one of the standard market sorts, and more blooms of this variety are sold than any other. The pink variety commonly known as Early Rose (fragrans) and another pink sort which goes by the name of Dunlap's Pink in our locality, come into bloom about the same time. These varieties should all be cut in quite close bud, that is just as soon as the petals begin to loosen. A little later comes "Drop White" (paschalis) the finest of all white pæonies, although a rather indifferent keeper. This variety should not be kept more than a week after being cut. If kept too long, although apparently in first-class condition, it has the disagreeable habit of suddenly collapsing.

Van Bonboch (festiva), also called Apple Blossom, a comparatively new variety, is one of the finest market sorts; this kind however should be left on the plant until partially open, as it develops but poorly if picked in too close a bud. The same holds good as regards the late variety Humeii. This latter is a very showy sort in the garden, it being one of the largest varieties in this group. As a cut flower however, it is not as satisfactory as the first named. In the first place it is a poor keeper, then it has a rather weak stem, and besides this the outside petals of the flower always have a wrinkled and withered appearance. This variety, cut nearly opened on the plant, should be marketed the next day.

One of the last is Late Rose (roseum) a remarkable keeper, and on that account of value, although the bloom is small, and in shape not very pleasing. There are several other varieties grown, such as Potsii, and the white with lemon center, which however, are not much in demand as cut flowers. At the Klehm nurseries we also find a large assortment of all the latest English varieties, few of which however seem to have much merit as profitable market sorts.

But now as regards the keeping of the flowers after they are cut. The blooms are cut with an average length of stem of about 15 inches, "old red" however not being a tall grower, can not always be had with as long a stem. From the field the flowers are taken to a convenient place for sorting, where the leaves on the lower part of the stem are stripped off. The flowers are now sorted in first and second quality, and tied in bunches of a dozen each. After that the flowers are placed in pails of water and kept in a cool cellar or refrigerator until wanted for shipment. Many of the good keeping varieties as above mentioned may be kept safely for two weeks or more in an ordinary cool basement or cellar. But if the stock is intended to be kept longer it must be placed in cold storage, in an even temperature of any 38° to 40°, where such varieties as Early White and Late Rose have been kept in good condition for 4 weeks and more. Before the flowers are sent out for shipment, or placed in cold storage each bunch should be tightly wrapped in paper and marked No. 1 or No. 2. When marketed in the bud there is little danger in crushing, and the bunches may be packed closely together in large baskets. To shippers, however, at long distances from a market we would not advise the placing of their flowers in cold storage for any length of time, as a long journey would be ruinous to stock that was kept in this way, but all flowers should be placed in water for at least 6 hours before shipment.

The accompanying illustration shows a number of blooms and buds at the stage of development at which they should be cut. In the upper right hand corner is a bud of the early white Whittleji, and at the left is one of the early rose. These two varieties are cut quite tight if intended for shipment or to keep for some time. The top center flower is the late rose, which should be cut when partly open, as shown; and below is a bloom of Humeii which is cut at about the same state of development.

Packing Plants for Shipment.

A proper method of packing plants is one of the most important matters in the management of a shipping trade, for on this, to a great extent, depends the safe delivery of an order, and the following notes from an experience of more than twenty years may possess some interest to some of those now making a beginning in this direction. It is proposed to divide this subject into two divisions or heads, namely, "Summer packing" and "Winter packing," the present article being devoted to the first division in accordance with the season, and this to be followed with some correspondingly brief notes in regard to winter methods.

The first portion of the work of packing is the tying of the growths and foliage in such a way that they will not bruise or rub together to an injurious extent after being placed in the box, but during warm weather it is not wise to cover the foliage with wrappings any more than is absolutely necessary, for when shipped to a distance the foliage so covered is very likely to become bleached and possibly heated. Among foliage plants, palms in general are the most important at the present time, and the sorts most used in the trade are quite easy to pack, though the methods used require slight modifications to suit the peculiarities of different species.

For instance, a latania in a 4, 5 or 6-inch pot can usually have all its leaves drawn up in a loose roll and secured with a narrow band of paper and a single tie of twine, the object of the band of paper being simply to prevent the twine from cutting or marking the leaves. But with a larger specimen than those mentioned above it is advisable to take the center leaf first, especially if it is just unfolding, giving it a wrapping of paper its entire length, this being done to protect it from the spines on the other leafstalks, when the latter are drawn up around it. Then follow by drawing up the leaves in succession, avoiding creasing or doubling the leaves as much as possible, and using only enough paper to protect them from cutting. This method may be used with any fan-leaved palm if carefully handled, and seldom results in any injury to the foliage. For the pinnate leaved palms, of which Areca lutescens and the kentias are good examples, much the same plan can be used with equally good results, the chief care

Early Rose. *Late Rose.* *Humeii.* *Whittleji.*

HOW TO CUT PÆONIES FOR MARKET.

being to draw the foliage up smoothly, and not too tightly during the hot months. In the case of a large areca in which the secondary growths from the base have attained considerable size, it is best to tie up the main shoot first and then to follow with the smaller shoots, thus using the central growth as a support for the weaker ones.

Pandanus and dracænas can also be drawn up in the same manner as indicated above, a single tie being sufficient for small plants at this season, but from the fact that more or less water is liable to lodge in the axils of the leaves and down in the center of both pandanus and the various dracænas it is a wise precaution to lay these plants over on their sides in the sun for a short time before tying them up, particularly if they are going a long distance, in order to dry the foliage, otherwise there is a possibility of rotting while in the box.

Ficus elastica grown on single stems should also have their leaves drawn up from the bottom, being careful to draw them up smoothly in the form of a hollow tube, not individually but as a whole. Tree shaped ficus should have the various shoots treated separately first, then draw them all together and tie around a stiff stake. It may be added that large dracænas and pandanus can be more thoroughly supported also by tying to a stake after the foliage has been tied up, but the ordinary trade palms do not require staking if the plants are well established specimens, and none other than plants answering to this description should be shipped at any time. But as an additional precaution with a tall palm, it is well to tie it to a crossbar nailed across the center of the box, in order to prevent the top from threshing around when the box is roughly handled.

Plants in flower are somewhat more risky to pack than palms, but the main point to keep in view in the summer packing of such stock is the fact that too much wrapping will surely result in the ruin of the flowers, and that all the growths should be so tied to a stake or stakes that the flowers cannot batter together. Easter lilies may be safely transported by tying securely to a stiff stake, the stake being long enough to extend an inch or two above the topmost bud, and then binding the buds and flowers in sucession quite tightly to the stake, using for the binding operation a long strip of tissue paper, and the plants may be turned out of pots and slipped into paper pots, before laying them down in a box and cleating securely to the ends of the latter. In this case also the cross bar in the center of the box is very necessary, and each plant should be securely tied to said bar, to prevent any battering of the heads.

For small lots of bedding plants there is probably no better or cheaper way of packing than to stand them up in chip baskets, but if going more than twenty-five miles I think it is safest to roll the plants in paper before placing them in the basket.

Orchids in general, *if not in bloom*, are not difficult to pack, except that many of them must be left in pots to prevent root disturbance, and this makes an extra amount of packing material necessary to obviate the breakage of pots that is otherwise inevitable. Those grown on rafts can readily be fastened to the sides of a box with a nail or two and a piece of wire, and at this season will be better without any paper covering, with the possible exception of such easily injured species as phalænopsis.

Small ferns should be turned out of pots and rolled in paper, but with the upper end of the roll open, so that the fronds can get some air, and for short distance shipments may be stood up in boxes, with only a covering of strips nailed across the box in such an open manner as to demonstrate to the most obtuse expressman the absolute necessity of keeping the package right side up. But for long distances the only safe method is to fasten the plants in the ends of the box with strips or cleats.

Those having much shipping to do find it best to buy lumber in large quantities, and to have the boxes made on the place, and in the east the most satisfactory lumber for the purpose is found in the form of Virginia pine, ½ inch thick, for sides, top and bottom, and either white pine or hemlock, 1 inch thick for ends, this combination making a stiff box without excessive weight. In some other parts of the country a cheaper substitute may be found for either of the above. For packing material there is nothing superior to excelsior, this being clean to handle, not expensive (costing about $15 per ton in small quantities, and much less in carload lots), and is not so likely to heat and decay as hay.

In placing plants in a box it should be remembered that the express companies charge extra rates on all boxes in which the plants stand above the sides of the box in such a way that other freight cannot be piled on top, and therefore all tall plants should be laid down and cleated into the ends of the box.

Provision should be made for ventilation at this season, by boring some holes in the sides of boxes with a one-inch bit, or by cutting slits in the boards, and a strip cover, with about two-inch spaces between the strips is much the best for all summer shipments. W. H. TAPLIN.

A Serious Attack of Cucumber Anthracnose.

Mr. J. F. Wilcock of Council Bluffs, Iowa, makes complaint of a serious blight of his cucumbers, of which he says he has about four acres under glass, and the plants are rapidly being killed. He says that the blight "begins generally with light brown spots on the leaves which spread and run together, and gradually including the whole leaf which withers completely as if frosted, after which the stem of the leaf becomes watery and rotten clear down to the vine." This description might apply to a number of leaf blights of the cucumber, and it is only when the specimens are examined micro-

scopically that the real cause of the trouble is determined. Upon making such an examination it was easy to demonstrate the cause of the trouble which is doing such serious injury in these large greenhouses devoted to the growth of cucumbers. When a brown portion of the leaf is examined with the high power of microscope it is easily seen that the whole surface is almost entirely covered with a fungus. This low parasite has previously sent its threads all through the substance of the leaf and then coming to the surface here and there have produced patches of spores. The epidermis of the leaf has been broken through, and over the rupture is to be seen a multitude of nearly oval bodies which are the spores of this fungus. The name of the fungus is Colletotrichum lagenarium. This fungus is by no means new among cultivated plants. It was first brought to notice in 1875 as causing a remarkable spotting of bean pods. Since that time it has been observed in many countries, and in our own United States it is one of the destructive pests of the cultivated bean. It thrives also upon the watermelon, muskmelon, pumpkins and squash, so that it has a wide range among the members of the cucumber family, and also is found as above stated upon the bean. That it is the same fungus upon all these hosts is proved by a process of innoculation from one species of host plant to another, so that there remains little doubt of the identity of this fungus. Many experiments have been carried out to discover a method of treatment that would prove satisfactory, and while the end is not yet in connection with the experiments it is safe to say that this anthracnose can be controlled in large degree by using the standard fungicides, namely the Bordeaux mixture and the ammoniacal solution carbonate of copper applied in the usual way.

There is this to be insisted upon, that fungicides act as preventives rather than cures, and in order to keep the plant in healthy condition the fungicide needs to be applied very early in the season. In fact at the present time experiments with beans are now going on under the writer's supervision, the fungicide having been applied to the bean seeds before they were planted. No experiments so far as is known have been made in a similar way with the seeds of the cucumber, and it is hoped at another season to be operated with the members of the cucumber family, namely the pumpkin, squash, melon and cucumber in the same way by first treating the seeds with the Bordeaux mixture, or some other fungicide and then determining what effect is produced. However, it goes without further saying that Mr. Wilcock should insist upon a thorough cleansing of his greenhouses. The soil which he has for the growing of his cucumbers is unfit as it now stands for further use, for a crop of this kind, and it should be either treated with some fungicide, or a healthful, fresh soil introduced into the greenhouses. In short the best of sanitary measures should be observed in connection with the growing of cucumbers where the fungus which is now ruining his crop should not be able to gain a foothold.

While it has been said before this fungus is not at all a new one and has been prevalent in New Jersey and elsewhere upon the cucumber plants grown in open culture, this is the first time that a complaint has come on so large a scale of the rapid killing off of cucumber vines under glass. If there are others who are growing cucumbers in a similar manner and are troubled in a like way the writer would be pleased if such sufferers would communicate with the undersigned and accompany such letter with specimens of the diseased plants. It is evident that heroic measures must be taken for the stamping out of this serious fungous pest. BYRON D. HALSTED.

New Brunswick, N. J.

Seasonable Hints.

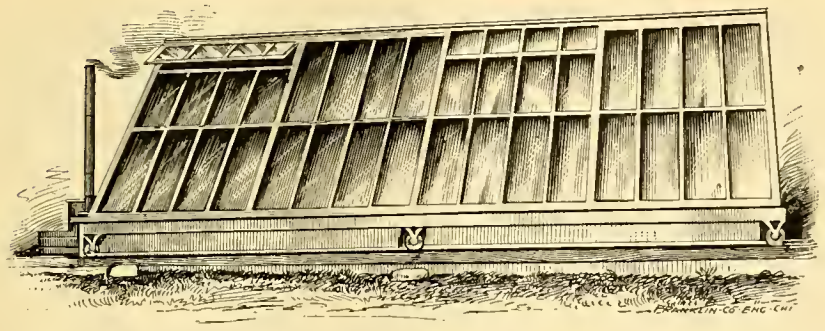
The unusually long wet cold spell has been succeeded by a hot dry time, and altered entirely the conditions both outside and in. As soon as the rush of bedding out is over, which it nearly is now, you will be very anxious to look after several important plants for next year's business. There is no plant yet in commerce so useful for the center of vases or veranda boxes as Dracæna indivisa. No palm, however cheap they may be, or even how expensive they may be, will flourish in the wind and sun as it will. It is never too late to sow it, but you can hardly make a useful plant in one year. Some large growers plant them out in summer time. For a moderate quantity I prefer to grow them in pots, plunged in frames in old rotten hotbed manure and in full exposure to the sun. Pot in good stiff loam with a good allowance of rotten manure, and they will make sturdy plants.

Another plant which has further proved its value in the above kind of work, particularly in veranda boxes, to which it adds a light and feathery appearance, is Grevillea robusta. It is a tough hardy plant and when not over two feet high most graceful. If you sowed seeds of it early in the season as recommended they should now be nice little plants in 2 or 3-inch pots, even if they have been neglected. Shift them into a 4-inch when you get time. Pot firm in a good loam and keep under glass the whole year. In winter they thrive in a very cool house, which makes them serviceable for many kinds of decorations. Some of my friends will say such a common plant does not merit so many words, but they must remember it will take the place with the average florist of a fancy palm that would cost six times as much.

Don't put your Araucaria excelsa out of doors; keep them well watered in the coolest and airiest house you have and shaded. Small and medium sized palms, such as kentias, arecas and latanias, keep indoors, well shaded, with plenty of fresh air, and they will greatly grow and improve these summer months. Large growers of the above keep the fires going in the hottest months, and force them along at a "two-minute" gait, their idea being to manufacture a plant as quickly as possible. Your object is to have well grown sturdy plants that you can confidently recommend to your patrons as a palm that will thrive in their houses. You will have time now to rid them of scale and mealy bug, and can keep them well syringed and give them plenty of room. Large palms that have grown as large as you want them to be may stand out of doors. I have found no harm come to latanias, arecas or kentias stood in the broad sunlight, providing they were faithfully watered. They will fade out a little, but that will all come back when they are housed again in fall.

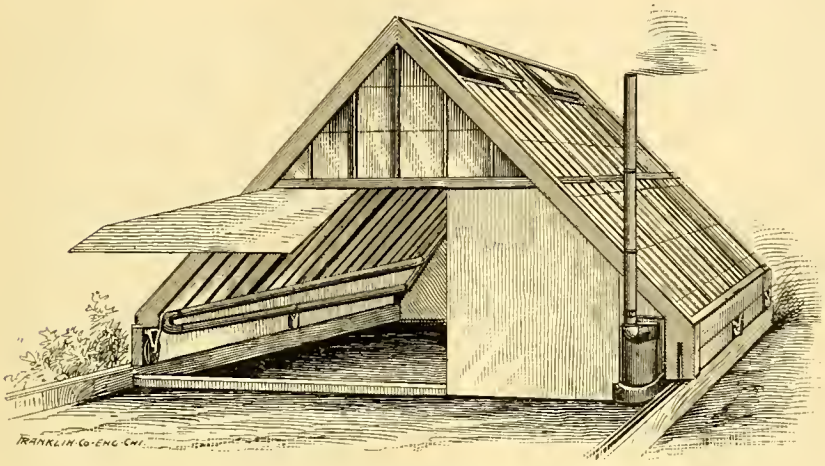
Lilium auratum and L. lancifolium in the several beautiful varieties (or species) will now be coming into flower. The latter are most useful, and should be grown by all retail florists. They should now be in a heavily shaded house where there is an abundance of air. They like to be cool and their flowers last so much longer. If you don't have such a house then put them out behind a shed or somewhere that is well shaded. Don't throw away old bulbs of the lancifolium lilies. They are just as good next year as you can buy, only when the stalks are cut don't neglect watering entirely, but dry them off as the dryness of their stems and leaves indicate.

If you took off or saved the little bulblets on the callas last September when you potted up the old roots and grew them along either under or on top the bench they will be now in 4-inch pots. Get at them at once, shake off a good deal of the earth and pot in 5-inch pots in soil that has at least one-fourth well rotted cow manure. Plunge out of doors; well chopped up old hotbed is the best material for that purpose. Choose a place for plunging where water won't stand, for the callas need a deluge of water. Never mind how shabby they look just now; they will make fine sturdy plants by October and flower earlier than the old bulbs. With the old bulbs you can let them rest entirely till September, then shake them out and start in entirely new soil. Callas have been rather plentiful last winter, but there will be likely a better demand next winter.



The torrid spell we are having at present will dry up things pretty badly unless you exercise your brains and muscle to some extent. You ought to be able to get all your odds and ends into one house, where a heavy shading won't hurt now, and remember a great help to the plants that are sweltering and drooping now is not only sufficient water at the roots (once a day ought to be enough for them), but they are wonderfully benefitted by a cooling down of the houses at least three times a day. By that I mean a wetting down with the hose. It's not the quantity you pour down, but the scientific way in which it's done. It's simple this time of year to learn a man to syringe a house of roses if it's all roses, but suppose it's composed of 20 different sorts of plants; then a man has to have a knowledge of them, and instinctively directs the spray to the lilies in bud or the fuchsias, but leaves the gloxinias and several others alone. It would take a chapter to fully write up the science of handling the hose, and I don't pretend to do it, but learn to do it if you want to succeed as a plant grower. It is no folly to call it and watering a true science. Did you ever succeed in watering a bench of plants in pots and attempt to hold a conversation with some one at the same time? If you succeeded I would not give you ten cents a day for your skill. WM. SCOTT.

A Travelling Greenhouse.



The accompanying engravings, which we have reproduced from the English *Gardening World* show a greenhouse designed by a London firm for use in bringing on early fruits, vegetables and flowers, moving it on from section to section as needed. Would such a movable house be of any value in bringing on hybrid roses, etc., in early spring?

DO YOU WANT Mr. Scott's seasonable hints for the year in book form, so that you can refer readily to his suggestions for any week in the year? You will find them in this form in our trade directory and reference book for 1894. Price $2.00.

YOU CAN never invest $2 to better advantage than in a copy of our trade directory and reference book.

END VIEW.

A TRAVELLING GREENHOUSE.

Chicago.

The supper of the Chicago Florist Club last Thursday evening was a very successful affair and was much enjoyed by the 45 or 50 members present. Mr. S. B. Parsons happened to be in the city and was a welcome guest at the supper. The two tables were lavishly decorated with flowers and plants and flowers were also freely used around the room.

With the advent of the coffee and corn cob pipes came Prof. Carnes and his wife and daughter, each of whom gave excellent recitations that were warmly applauded.

The first toast was "The advancement of ornamental horticulture," to which Mr. G. L. Grant responded as follows:

"While it is true that the progress of ornamental horticulture during the past quarter of a century has been marvelous, it is nevertheless a fact that the skilled gardener and florist have not made a corresponding advance in public esteem. In literature all gardeners are still classed with the coachman and the hostler, and as a consequence the same classification is followed by the general public with comparatively few exceptions. We must admit that there is a considerable number of self styled professionals who may be so classed, but it is an undoubted fact that to-day the great majority of the workers in the field of ornamental horticulture rank high as men of education and refinement. Probably no other profession counts among its followers so many who have entered it from pure love of the work. In no other profession will be found so many close students of the underlying principles of each detail of their daily labor. And no other profession demands from its leaders a broader knowledge or a wider culture.

"Gentlemen, if we would hasten the advance of the profession we must first take steps to place it upon its proper level in the public mind. We must bring our strong men out into the light of publicity that the world may know us for what we are. We have been seriously remiss in our duty in this respect in the past. Further, we must make a broader use of our numerous organizations. We must as carefully study to in a measure control political causes that may affect horticulture as we now do the life histories of insects injuriously affecting plants. We must exercise the power we possess, but which has heretofore been allowed to remain dormant. Had the horticulturists of the whole country exercised fully at the right time and in the right way the power they possess, the horticultural department of the World's Fair would have been what it ought to have been and not what it was. Let us profit by that lesson.

"Let us make ourselves felt in the management of our park systems. Now is the time to plan a campaign that will put men in our park boards who are to at least some extent familiar with horticultural matters. Let us exercise the power we have in securing the nomination for governor of a man who will pay heed to our suggestions when elected. We are strong enough to do it if we only work steadfastly along the right lines. Let us exert in favor of what is right and proper the same power that is now used by others in favor of what is wrong and improper. Let us take a broad view of the matter. Remember that we are not alone. Remember that among the members of our horticultural society will be found a host of men whose names carry much weight and every one of these can I am sure, be depended upon to lend a helping hand if he can see wherein it will effect good, and he will recognize the fact that strong organized effort cannot fail of effect.

"We all love our city and wish to see it beautiful and healthful. Let us take steps toward the creation of a commission which shall have power to plant and maintain shade trees on every street possible. The city of Washington has already done this, and as a result Washington is famous the world over for its beautiful trees. We can do the same here. To be sure it will take work to carry such a measure through our city council, and still more work to insure the appointment of proper men on the commission, but it can be done. We would surely have the active support of the daily press and by persistent effort all obstacles could certainly be overcome.

"If we succeed we will have exerted a far-reaching influence, for horticulturists in other cities will follow our example, and making use of our working plans will accomplish similar gratifying results. This may seem rather out of the line of work of a club of this character, but I believe we should take a very broad view of the subject. The florists of the country are better organized than any other class of horticulturists. They seem also to be harder workers in any cause they may espouse and it would seem that in order to get the matter started it should receive its initial impetus from them. After the work is under way others will give the needed assistance."

"Our Parks" was the next on the program and from Mr. J. A. Pettigrew came the following interesting response:

"In these days of high pressure living and business competition, with its consequent cares and worries, it is pleasing to note that so much thought, money, and time is given to plans for the creation and development of public parks. The benefits arising from the establishment of parks and breathing spots in crowded cities is so well understood, that neither time nor money is begrudged in carrying on the work of extending and beautifying them.

"In the city of New York during last year nearly one and one-half million of dollars was spent on its parks and boulevard system, and large additions recently made thereto will largely increase the cost for improvement and maintenance in future. The city of Brooklyn's parks cost last year about one million dollars, as did the parks of our own city. The same or nearly the same ratio of expenditure for park purposes—as compared with population—prevails in most of the large cities of the United States.

"In view of the increasing importance and magnitude of this work, it becomes more a matter for the best thought and effort of the statesman, the landscape gardener, and of the horticulturist to meet the public need. The statesmen to devise such methods for the appointing and organization of the governing powers of the parks as will place their management in the hands of men of high class, who will conserve the interests of the people, and jealously guard their trust from any intrusion of schemes likely to divert the park from its intended object or purpose, who will be beyond the reach of political jobbery, and above the suspicion of a prostitution of office for personal gain.

"The assistance of the landscape gardener should where possible be called in the selection of lands to be purchased for a park; he will note points of advantage not observable to the unpracticed eye; his experience and training will fit him to judge of location, availability, soil and natural advantages; in designing the park

he will study the nature and conditions of its use, as well as the natural features it may already possess.

"A park conveys the idea of a place for rest and retirement, where nature can be communed with. An isolation from bricks and mortar, where the street life, and office walls of the city can be forgotten; where trees, shrubs, flowers, green sward and water in harmonious arrangement, form a pleasing landscape, restful to the tired brain, refreshing it with beauty and quietude.

"Such then is the mission of the landscape gardener; to bring about this effect he must use the material he finds around him, assisting nature here, boldly creating a natural effect over yonder, while in another spot he leaves nature alone pure and simple in its beauty.

"Many parks provide for amusements of various character, often at a great sacrifice of sylvan beauty and its restful influence. The tired worker vainly trying to escape from the bustle and noise of the city is disappointed, and instead of finding rest and quiet finds himself jostled in the hurly burly and excitement of contest. In parks of large extent the designer can so arrange his plan, as to include these features without detriment to other effects, by providing for their indulgence away and isolated from sylvan creations. It is not intended here to decry against these amusements, many of which are admirable and necessary for the development of the youth of our cities, but to protest against their introduction into the parks when they mar park effects; let those seeking such amusements be accommodated when possible, but not where they will defeat the intent and purpose for which the parks are created.

"Without disparagement to works of art, it may be said that an undesirable feature in park scenery is the monument. Monuments in bronze of this or that person are being introduced in such numbers that in the not far distant future, some of our parks will more resemble depositories for the dead than places of recreation and rest for the living. Creations in bronze of the sculptors' genius, placed where natural features are produced or intended, have a destroying or neutralizing effect on the work of the landscape gardener.

"The subject of parks and their management is a very important one, and is worthy of the best thought of this club and all societies of a kindred character. The interests involved are very large, and great ignorance in horticultural matters exists among those having their control and direction, and I think it comes within the scope and power of this organization, to influence for good, existing methods of park creation and administration."

Mr. S. B. Parsons responded to a call and delivered a very effective extemporaneous address in which he spoke of flowers as the crystallized thoughts of God and their perfume His breath. He paid a glowing tribute to horticulture as a profession and spoke of the wonderful progress made since he first entered the ranks over 50 years ago.

Short addresses were also made by Messrs. J. T. Anthony, Edgar Sanders and A. McAdams.

An enjoyable feature was the vocal music by the sextette of which Messrs. Walter Kreitling, Chas. McKellar, Jos. Curran and Hubert Mann were the leading lights.

Mr. O. P. Bassett was unfortunately unable to be present in the flesh but he was there spiritually through the medium of the big bowl of punch contributed by him toward the evening's entertainment.

We are now in the midst of the school commencement season, which should by rights make things lively. There is, however, no sign of unusual activity; in fact trade is so dull as to remind one of midsummer. And not alone is the local demand extremely light, but orders for shipment have also fallen off very materially. The hot weather which was experienced last week had the effect of rushing the remainder of the rose crop on the market, which of itself was enough to swamp it, even with a fair demand, but coupled with a stagnant market prices went away down. In lots of 1,000 fair stock was sold for from $8 to $10. Quality is getting poorer every day; such a raft of mildewed stock as is now dumped on the market hasn't been seen here for many a day. Stock cut from young plants, benched early, is, however, improving. Selected stock in small lots goes at from $2 to $4, according to variety. Good Beauties still bring $2 to $2.50 a dozen.

Carnations are plentiful and prices down for common grades. There is a wide range in prices. Poor to fairly good commons sell at 25 to 75 cents, while selected, long stemmed and disbudded stock bring $2 to $2.50. Sweet peas are a bad glut at present. $1 per 1,000 is the offer, and few buyers at that. Pæonies sell fairly well this spring. Very few flowers, if in salable condition, have gone to waste. Outdoor roses are in, but are generally poor and crippled. Jacques are not nearly as good as in former years; these sell at $1 to $2 per 100.

The Cut Flower Exchange got away from 45 Lake street just in time. Late last week the building was destroyed by fire.

Lincoln Park is now simply a part of the political machine. The politicians have made almost a clean sweep, among the men removed being several who have been there 20 years. The only one occupying a position of consequence and that has escaped removal is Head-gardener Stromback.

New York.

The past week has been one of most pronounced inactivity. The relief from the condition of midsummer dullness which might reasonably be expected just now in the way of demands for graduations and similar festivities has not materialized so far. To add to the perp exity the cut of most flowers, especially roses, has been enormous, owing to the refreshing effect of the preceding period of cold, damp weather on the plants. Even the Greeks have lost heart and are disinclined to buy at any price.

There is an immense overstock of everything coming in, the only redeeming feature being the supply of white sweet peas, which is scarcely equal to the demand. Fine peas of the other varieties go slowly at one cent per dozen. At the 34th street market the space is scarcely large enough to accommodate the heaps of pæonies, larkspurs, cornflowers, coreopsis, Jacqs and other outdoor productions, and the price as a rule is "take whatever you can get."

Mr. John H. Taylor's "smoker" was a pleasant affair, limited materially in attendance and animation by the extreme sultriness of the weather, which was almost unbearable. The entertainment provided was of a high order, and the good taste displayed in all the arrangements was most creditable to Mr. Taylor and those who gave him their assistance.

Arrangements are nearly completed whereby the New York delegation to Atlantic City next August will travel with comfort and at a low rate of fare. Judging from the prevailing talk the party will be by far the largest ever representing New York at a S. A. F. convention.

Quite a number of gentlemen prominent in the trade are contemplating trans-Atlantic voyages. Winfried Rolker sails on the Lahn June 19, Chas. Thorley, on La Touraine June 23; Thos. Young, Jr., on the Havre June 26, and I. Forsterman, on the Oppdam, July 5. Mr. W. A. Stiles of *Garden and Forest* has just returned from a visit to England and is highly pleased over the kind reception which he met there.

The second auction sale of orchids by F. Sander & Co. on Friday, June 15, was very satisfactory, prices and demand being fully up to expectations. In the audience were: Mr. Wm. Griffin of Lenox, Mass., and Mr. R. M. Grey of Orange, N. J., and other orchid fanciers were represented by substantial mail orders.

Wm. Elliott tells of a recent visit to Boston in company with a select team of veterans in bowling on the green. They were received with due consideration by the Bostonians, who treated them with unbounded hospitality and then thrashed them unmercifully in the bowling contest.

Mr. W. H. Siebrecht states that he has given the new rose, Belle Siebrecht, a thorough trial outdoors the past winter, and the plants proved perfectly hardy and are now flowering in profusion.

Philadelphia.

The past week about wound up the school commencements and weddings, and while there are still to be a few more of the latter between now and the first of July the demand for flowers from this source may be considered about over for the season.

There are still plenty of flowers and really good ones for this time of year. The Kaiserin is doing very well and the Bride is still in very good shape; Mermets are also good. The outside roses have been fine this season. Mr. Heacock has had a fine crop of Jacqs, good flowers with stems about a foot long, each carrying an unlimited quantity of thorns. Mr. Lonsdale is sending in a fine lot of Brunners as good as many growers had them in winter; most of them were cut from plants imported last fall and planted outside. The Jacqs sold for $4 per hundred and the Brunners for $8. Other roses are about the same as last week. There is one point to be noted about the Kaiserin, and that is its freedom from mildew. A few weeks ago almost all kinds of roses were badly mildewed, while the Kaiserin was entirely free.

Sweet peas have been plenty and of good quality; they have sold very well at from 50 cents to $1 per hundred, quality and quantity ruling the price. Hostetter of Manheim, De Witt of Bristol, and Ed. Swayne of Kennett, are large growers of these flowers. R. L. Longcope of Holmesburg has a large lot planted outside for the summer trade, of which he makes a specialty. O. B. M. Felton of 63rd and Vine has an old fashioned garden patch, pansies, forget-me-nots, Scotch and mule pinks, sweet william, digitalis, cornflower, etc., are his specialties, his main specialty, however, is to please his customers, and O. B. M. will go to any trouble to effect this end.

Cornflower is now the correct thing for the boutonniere, and quite a good deal of it is used up in this way.

W. K. Harris is to have another sale at

Aug. Rolker's auction rooms on Friday, June 22.

Robert Craig has bought out a half interest in Col. Bonnaffon's patent iron fence; this is one of the cheapest and at the same time most durable fences on the market. It is being largely used in parks and ornamental grounds.

Mr. Connor of Lansdowne is erecting two houses 110x16 which will be planted with roses. K.

Boston.

Rhododendrons have been at their height during the past week, and the many places in this vicinity where they are extensively planted have been constantly crowded with admiring visitors in numbers greater apparently than ever before. The annual visit of the committees of the Horticultural Society and friends to the Hayes estate at Lexington occurred on Tuesday, June 12. This is one of the great events of the season, and is always looked forward to with high anticipations by those fortunate enough to receive an invitation. A pleasant feature on this occasion was the company of Messrs. Thomas B. and Franklin Meehan of Philadelphia, who were returning home from the Nurserymen's Convention at Niagara Falls and took the opportunity to pay Boston a short visit. Mr. T. McCarthy of Swan Point Cemetery, Providence, also was one of the party. Mr. Comley, the hospitable custodian of the Hayes estate, is a thorough believer in good eating, a fact of which his own substantial girth is a practical demonstration, hence this part of the entertainment received first attention. After thus putting his company in the proper frame of mind to fully enjoy the show Mr. Comley conducted them over the vast estate, through the fine plantations of conifers and other ornamental trees and shrubs, and finally to the great tent under which is grouped the superb collection of half hardy and tender rhododendrons for which this place is famous. They are better if anything this year than ever before, but few of them showing signs of injury from the sudden cold weather of April, to which many of them were exposed. The outdoor rhododendrons were found to be in equally fine form.

An equally agreeable occasion of the past week transpired on Thursday at the pretty home of Mrs. E. M. Gill at Medford, that lady having extended an invitation to the habitues of Horticultural Hall and their ladies to the number of about thirty five, to visit her at this time and thus assist in duly commemorating the naming of a new primrose which Mr. Hatfield has thought worthy to bear Mrs. Gill's name. The occasion was a most enjoyable one. One of the pleasantest features of the program was a drive through the most attractive sections of Medford. The old town looked its prettiest in its June dress.

Benjamin D. Hill, who died recently at his home in Peabody, has been a familiar figure about the flower stores and the exhibitions at Horticultural Hall for nearly a quarter of a century, and will be greatly missed. While not giving his whole time and attention to the florist business yet he has always done quite a little trade in that line in Peabody and Salem, and was evidently very fond of any work that brought him in contact with flowers. He had a habit of carrying a red carnation in his mouth, and was seldom seen without it. He had a most agreeable and kindly disposition, and made many friends by his readiness to do a favor at all times, even when at considerable inconvenience to himself.

The philadelphuses at the Arnold Arboretum are most gorgeous at present. The collection of this genus is very extensive. Syringa Amurensis, which blooms between S. vulgaris and S. Pekinensis, is now in flower and is one of the most fragrant of all the lilacs. Mr. Dawson's pets, the hybrid multiflora roses, show improvements every year. Among a lot of seedlings two years old which are beginning to bloom there are a number of exceedingly graceful and prettily colored sorts. The original Dawson rose covers a large trellis and is a perfect mass of flowers.

Out at Mr. John L. Gardner's Mr. Atkinson has had his usual success with the ericas. On looking at this beautiful collection one cannot help wondering why the heaths are not more generally grown in this country. But not everyone can make them grow as Mr. Atkinson does.

Mr. Wm. Robinson has been quite sick with tonsilitis, but is now recovering.

In town: Mr. W. A. Stiles of *Garden and Forest*, New York; Alfred Dimmock of F. Sander & Co., London; and D. McRorie, representing, W. A. Manda, South Orange, N. J.

Baltimore.

Planting out is over at last and the men who have been engaged in dodging showers, and replacing plants killed by cold during the past five or six weeks have a chance to breathe a sigh of relief and look over the field. Prices have been low. Not really so low as might have been expected, but still low enough to cause complaint, of which there seems always a sufficiency. The trend of prices seems always toward the cost of production, and there are generally enough producers about to keep the downward tendency going. Who is to blame? If a man has a heavy stock of valley at Easter and sells it at fifty cents a dozen in order to dispose of it and attract custom, as was done here two seasons ago, whose business is it but his? If another has a heavy stock of alternanthera and chooses to sell at twenty dollars a thousand rather than throw it away, what is to be done about it? This occurred last year.

A curious feature of this price cutting is that no one seems to resent it more bitterly than the man who does a little himself occasionally. Years ago when the writer was trying to sell a bill of plants, the customer said to him "Your prices are much too high, and to prove it I will show you a written offer from a florist to supply the same stuff." The offer was produced and proved to be from a member of the trade who had always advocated high prices. The effect upon the reader was discouraging, as far as upholding prices was concerned. In fact the only time when it is safe and good policy to charge high prices, is when one has a very superior article, and when no one else has it in very great quantity. While on this subject, has anyone ever seen a retailer who advocated high prices, who was unwilling to pay as little as possible for what he bought?

The weather is still unseasonably cool in the main, and the few warm days generally end in a thunder shower and cool night. Geraniums are growing nicely, but most bedding stuff is not much more than holding its own.

The cut flower market is rapidly settling down to the mid-summer stagnation, with everything but white roses in super-abundance. Funeral work is, and will probably continue for some time to come, the only steady source of income. Complaints about spring trade are general, but it seems hard to get actual figures to show just the percentage of falling off. In fact there are but a few of the trade who keep their accounts in such a form as to show the state of their business at any time, and comparison of seasons is largely guess work. MACK.

St. Louis.

The regular club meeting was held on the 14th, and was better attended than any for some time. The paper prepared and read by Mr. Witten of the Missouri Botanical Garden on "The hardiness of plants as affected by their exposure" was listened to with deep interest, and commended by all present, many of whom related curious incidents of plants' behavior brought about solely by different exposures and planting. It was the universal impression that most all the serious damage done to trees and shrubbery was owing in this climate to the southern exposure in the early spring, our hot sun first starting the sap to flowing, and then the cold freezes them up solid, killing the inner layer of bark, which is necessary for the plant's existance. A vote of thanks was tendered Mr. Witten for his able paper, and Mr. Koenig was requested to prepare and read one at the next meeting on herbaceous plants.

A committee of three was appointed to make arrangements with the railroads, looking towards attending the convention.

The committee having in charge the flower show reported what progress had been made and presented the usual "guarantee fund" for signatures; this guarantee fund is to be called upon only after the treasury of the club shall have become exhausted. A special meeting was held immediately after the regular meeting, and a committee of three appointed to examine and report upon the various places suitable for the holding of a picnic by the club members.

Mr. H. Pechman, late of the Pechman Floral Co., who has retired from the retail trade, was presented by his late associates with a bouquet of roses, tied with a bow of ribbon, upon which was lettered, "Rest at last." The stock used was as choice as could be had, after the wholesalers had cleaned up in the morning, and no doubt was fully appreciated by Mr. Pechman, who we understand adorned his desk with the tribute.

Late advices from Edwardsville, Ill., reports a heavy hail storm in that section; the hail was not fierce, but a steady downpour, which caused the stones to cover the surface to the depth of two inches. Outside stock, and especially sweet peas were ruined, while some damage was also done to glass.

The wholesale firm of S. Mount & Co. has dissolved partnership, S. Mount continuing the business. R. F. T.

Toronto.

The event of the past week was the annual convention of the Seed Trade Association. The delegates attending appear to have spent a most enjoyable time, banqueting, lunching, driving round town, sailing on the lake, etc. etc. Some very good papers have been read at the meetings, but the city dailies being so taken up with politics just now have not

found it convenient to furnish very full reports of them. Mr. S. E. Briggs of the Steele, Briggs, Marcon Seed Co. was elected as one of the vice presidents.

The weather has at last taken a turn and "de fremoniter 's gone up mor'n a foot"; in consequence the plant trade has been pretty lively, but oh! what a cutting and slashing of prices there has been. The fact is this plant business is altogether overdone in this city, and it would be better all round if a dozen or two were to drop out of it and grow cabbages and such like. But every one seems to be waiting for the other man to drop out. The last of the bedding out will probably be done this week, which is from ten days to a fortnight later than usual.

Gardeners and florists are beginning to pay more attention to their chrysanthemums now that the busy season is passing away. The interest in the coming show does not show any decline as yet, and the prospects are good. E.

Cincinnati.

The first of the week found a party of florists, consisting of E. S. Johnston, Geo. Meyers, Otto Walke, and a stranger seated with Will Murphy in his carriage making for his country home. Arriving at the foot of the Price Hill incline we were soon hoisted to the top, from which we wound our way around the straight roads, and after having many narrow escapes in the hills and hollows, we brought up at Mr. Murphy's home about 1 p. m., Mr. M's. best half had prepared a sumptuous dinner, and from the way said dinner disappeared the boys were certainly hungry, and did justice to same. After dinner the usual games were indulged in and at a late hour we were again headed for Cincinnati, believing it was the pleasantest day we ever spent in our lives. We find in looking over Mr. Murphy's place that he is something of a horticulturist, as well as the largest carnation grower around our city. His farm contains twenty acres, two acres of which is planted in grapes, the same amount in peaches, pears, apples, and small fruits, and everything in the very best of condition. He has 25,000 carnations planted in the field and looking splendid. His greenhouses, eleven in number, contain 8,000 feet of glass; of this 7,000 feet is used for carnations, and from September 1, 1893 to June 1, 1894, he had cut 203,000 blooms, at an average price of 1 cent each. His mode of heating is hot water under pressure.

Business has been a little slow during the past week, and with the exception of funeral work the stores have been very quiet.

On June 11, Chas. I. Jones, Jr., of Walnut Hills, made an assignment to W. Rendigs; liabilities about $3,000, assets $1,200. This failure was rather unexpected, as Charles was supposed to be doing a good business, but dull times and slow collections are the principal reasons.

The firm of Huntsman & Hardesty has been dissolved by mutual consent. Mr. Hardesty will continue at the old stand; Mr. Huntsman will devote his time to the greenhouses, of which he is manager. They are situated in the Highlands of Kentucky, overlooking the Ohio River; the scenery from this point is the grandest in this section. We sincerely hope and wish both of these gentlemen success.

As business is slow one of our enterprising Vine street florists has placed two penny-in-the-slot machines near his door. One contains root beer, the other orange cider. He tells me the machines more than pay the rent of his store.

Harry B. McCullough has just returned from Toronto, where he attended the seedsmen's convention. He reports a good meeting and a splendid time.

The commission houses are now receiving some splendid lily of the valley and good carnations; plenty of roses, but the quality not so good.

Our visitors during the week are as follows: Walter Bertermann, Indianapolis, Ind.; C. Betscher, Canal Dover, O.; Karl Brown, with A. W. Livingston's Son, Columbus, Ohio.; John Barclay, with John Gardiner & Co., Philadelphia, and the genial all round good fellow Harry Balsley of Detroit. These gentlemen were all feeling good, and we trust enjoyed this visit with us. We are always glad to see our friends. G.

St. Paul, Minn.

The torrid wave of the past week had the effect of shortening the rose cut as well as deteriorating the quality. Brides, Mermets, Cusin, Watteville, Perle, Niphetos and Bennetts all succumbed and are of inferior quality; La France, Testout, Kaiserin, Albany and Meteor, however, withstood the severe heat and are producing fine blooms.

The demand has been fairly good though not up to the previous week. A great many outside roses are now in bloom and this of course hurts the sales of teas. Prices are firm at $1 per dozen at retail. Baskets and bouquets have been in demand for the "sweet girl" graduates, and altogether the week's sales have been encouraging.

In the plant line, bedding out is completed and but few sales are noted. Florists are planting out what is left endeavoring to make their own grounds attractive. They are a good deal like the farmer, who sold everything he could and ate what he couldn't sell. Perhaps, however, therein lies the key to success. At any rate we have yet to hear of a florist who would lose a sale of any size in order to beautify his own grounds.

Owing to the intense heat and great drought, the beds and vases throughout the city are not looking as well as they otherwise would. No amount of sprinkling seems to take the place of a good rain.

E. F. Lemke has cleaned out two of his rose houses preparatory to planting new ones. This would indicate that early planting is finding favor with him.

L. L. May & Co. have one house already planted and another one ready to plant. This latter house, a short span to the south, is undergoing a rearrangement of benches. The aisles will be placed on the sides with a single wide bench in the middle, thus giving the plants the full benefit of the sun's rays. In the old arrangement the south bench was shaded somewhat by the gutter.

Quite a good many plants are still seen on the market but are inferior in quality, and sell very slowly. A great many roses throughout the city are now in bloom. In fact your scribe was not aware of the existence of so many until they commenced blooming. One of the finest private collections in the city, is that of A. H. Wilder on Summit Ave. Groups of Hybrid Perpetuals and Standards, all in full bloom, of rich and varied hues, shed their rich perfume on the evening breeze, and give additional beauty to the already lovely avenue.

Our florists may not be alive to the fact but it is nevertheless true that many hardy roses and shrubs thrive here, and their extensive propagation right here in our midst offers a remunerative field to the grower.

Pæonias and syringas are now in full bloom. Clematis are also occasionally seen, while over all is thrown the rich mantle of green afforded by the Virginia creeper.

A peep into the leading growers' houses show a fine and thrifty lot of "mums" being grown for another seasons' trade. Now is the time to get together, boys, talk over plans and arrange for a grand exhibition next fall. We have the material, all that is lacking now for a successful show is unity and organization. Will we have it? FELIX.

Buffalo.

Much to the relief of everybody the weather turned, and as it could only turn one way we have had a real warm spell.

The last meeting of our club was held at the house of Prof. J. C. Cowell. There was not a large attendance, but a long way over a quorum, and three new members were elected. After the routine business was disposed of the paper promised by D. B. Long was looked for, but as Mr. Long and his paper were both absent we had to call on someone else. It was almost fortunate that D. B. L. was absent, much as his paper would have been appreciated, for we had a most enjoyable treat in the shape of a long letter from M. Guilland of France. The letter was written to Mr. Cowell, who kindly translated it. Mr. C.'s translation of Mr. G.'s French was enjoyed by all present. If it had been Portuguese or Polynesian the same ability would have been exercised with the same facility. The chief points of the letter were the tracing of the different species of cannas from their early known history up to the present date. The writer, whoever he may be was extremely sorry (at least he said so) for his inability to see the professor personally, explaining as the reason that he had in his trip round the world taken another course, and returned via the Suez Canal, and not as he intended, by the Erie Canal. What a mistake!

Since the warm weather has set in flowers have been plentiful. Those who properly attended to their carnation houses are now picking large quantities. Mr. Constantine, who has two houses, each 100x20, picks about 5,000 every day. Nearly all roses are showing a little mildew, but the average is better than in former years. There has been a few good society events lately, that have cheered up several of the craft. Speaking of carnations one of the carnation growers of Corfu picked a Portia to bring into town, he wound it round the inside of his hat. It went three times round and left 9 inches of stem, and the flower for a pigtail; by actual measurement it was 34 inches and stood up as stiff as the Democratic principles of David B. Hill. American Beauties are in town in great abundance, and of first quality; reason for this later.

W. S.

OBITUARY.

LOUIS GUERINEAU.

We regret to have to chronicle the death of Louis Guerineau of Cambridge, Mass., and later of Northampton, Mass., where he was engaged in the creation of a Botanical Garden for the use of Smith College there.

Louis Guerineau came from Chartres, France, to this country some twenty years ago, and was widely known by the

gardening fraternity in Boston and New York, as an intense lover of gardening and botany, and a most thorough horticulturist in every department. Having travelled extensively and practiced his art in every part of France, Belgium and England, he was considered a living encyclopedia of horticulture, and always ready to impart that knowledge, if of any benefit to a brother florist, as he was of a very genial and obliging disposition. Being also very modest and unassuming in his manners, he did not, perhaps, cultivate as large a circle of acquaintances as his merits would command, but was perhaps so much more thought of for it.

Some of the most pleasant hours of the writer have been spent in his society, and we must admit that, if older than he (Mr. Guerineau was 54 years old) we have often derived great benefit from these interested discussions on gardening.

Mr. Guerineau succeeded me in taking charge of the Botanic Gardens in Cambridge, and I believe that our worthy secretary, W. J. Stewart, received there with him his first rudiments in gardening. A remarkable fact in connection with Mr. Guerineau, is that all his ancestors, for 250 years back, from father to son, were gardeners.

Of late years Mr. Guerineau has been affected by mental depression, from a highly nervous temperament, it brought out insomnia, and was the cause of his untimely end.

He leaves a wife, two daughters and one son, the whole family in easy circumstances. He was a member of the Society of American Florists and also of the Florists' Club of Boston. D. Z.

News Notes.

BINGHAMTON, N. Y.—A new greenhouse 22x200 feet is being erected on the hospital grounds.

MADISON, WIS.—The summer meeting of the Wisconsin State Hort. Society will be held in this city June 21 and 22.

OWOSSO, MICH.—Mr. J. S. Schleider, the florist, has purchased three acres of land outside the city limits upon which he intends to build a range of greenhouses, his present quarters being too small and allowing no room for extension.

OGDEN, UTAH.—A. A. Gibbons Co., of 1257 24th street, will add a new house 20x75, to be devoted mainly to roses and a cross-section 25x25 for orchids, palms and ferns. The plant will then contain 3525 feet of glass. All heated by hot water.

MANCHESTER, N. H.—The first annual exhibition of the New Hampshire Horticultural Society will be held in this city some time in October, the exact date and other details being left to the executive committee. The society now has a membership of sixty.

BATAVIA, N. Y.—Mr. George Munick has purchased the greenhouses and business formerly conducted by Mr. Rudolph Grob on West Main street, He will add a few more houses and arrange to run the business on a larger scale. Mr. Munick took possession June 1.

STILLWATER, MINN.—Frank Berry will this summer build a new rose house 20x100 in best modern style, and will also enlarge and rebuild his present houses, adding a new front and a conservatory for decorative plants. He will also soon open a down town store.

ALBANY, N. Y.—The florists and other merchants on North Pearl street are making strenuous efforts to have the street vendors removed from the public thoroughfares. The mayor and the police commission have been repeatedly appealed to, but without result as yet.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By German florist in general greenhouse work; 11 years' experience. A. N., 730 Maplewood Ave., Chicago.

SITUATION WANTED—By young man, single, 6 years' experience in garden, sober; can milk; good references. Address 7 Center St., St. Albans, Vt.

Prevention of Bench Boards Rotting.

An inquiry comes from Erie, Pa., on the above, which was referred to me. I have used common whitewash, crude petroleum, and also water lime (hydraulic cement), and of the three I much prefer the latter. The matter of cost should not be considered, because it is a trifle anyway. In my experience the crude oil seems to soon evaporate, and the same can be said about the whitewash. After the soil or sand has been on the bench a few months, or at least one year, all trace of the whitewash is gone. I have *proved* that a heavy coat of water lime on the boards, put on when they are new (and that's the only time that anything will do good) will prolong the life of the boards to double the time they would last without it. I use the cement pure, and add only water enough so that it can be spread on the boards and thoroughly rubbed in with an old whitewash brush. The particles of the cement will go into the rough surface of the boards, filling it up, and preventing the water soaking the boards, and that's all there is of it. An inch board of hemlock or pine, under ordinary greenhouse treatment, will last about four years. With a good coat of water lime it will go eight or nine. I don't believe in 1-inch boards for a rose or carnation bench, only 2-inch plank should be used. They will not only last more than twice as long as an inch board, but you will be saved that great nuisance of tearing out the old bench.

About tar on greenhouse posts; I have had no experience with tar on posts except on fences, and I never saw any benefit that the tar did. On greenhouse posts the tar would have to be entirely used under ground, for the faintest smell of tar is dangerous inside the house. There is no need of using it. WM. SCOTT.

GLEN BURNIE.—Had you sent us your name and address we would have answered by mail. We cannot print answers unless the subject is of general interest.

I find no one interested in this company except W. T. Christopher.

C. W. COCKERHAM, Trustee.

It would be interesting to know on what grounds the Texas Seed Co. based their request for credit. The above figures would indicate that many of the leading seed houses have not yet drawn their lines of credit sufficiently close, or that the concern has been mismanaged.

MR. S. F. LEONARD and wife are now in San Jose, Cal.

BOTH St. Louis and Toledo are mentioned for the next annual meeting.

ALL varieties of pole beans growing in California are reported in bad shape.

RAINS occurring in different sections through the west about June 16 have improved the crop conditions.

AMONG the flower seed novelties promised for 1895 is a double morning glory and new colors in Jewell asters.

J. M. THORBURN & Co. have had their business incorporated under the New Jersey laws with a capital stock of $300,000.

HOLDERS of vine seed stocks are not disposed to make rates while the outcome of the Nebraska crops of this season is so uncertain.

THE American Seed Trade Association now has an active membership list representing over 135 of the leading houses in U. S. and Canada.

THE Blue Grass crop is reported good, and if dry weather continues for the next ten days, or the harvesting season, materially lower prices are assured.

PRESENT STATUS of Wilson tariff bill as it affects the seed trade is as follows: Garden seed, 10%; beans, 20% ad valorem; peas, 20 cents per bushel of 60 pounds.

PEA CROPS are said to be in fair condition, though some growers claim their fields to be one-third off; others say Wonders, Stratagem and two or three other green sorts are short.

THE CITY of Toronto has been so fortunate as to receive from Sir David MacPherson his extensive collection of hard wooded plants, the result of some 40 years of intelligent and painstaking effort on this line.

THE ELECTION of officers of the Am. Seed Trade Association for 1895 took place on Thursday and resulted as follows: D. I. Bushnell, St. Louis, president; S. E. Briggs, Toronto, first vice-president; T. W. Wood, Richmond, Va., second vice-president; A. L. Don, New York, secretary and treasurer; Frank T. Emerson, Waterloo, Neb., assistant secretary. Executive committee: W. Atlee Burpee, Philadelphia; Jerome B. Rice, Cambridge, N. Y.; J. Charles McCullough, Cincinnati; E. B. Clark, Milford, Conn.; C. P. Braslan, Chicago. Membership committee: W. W. Rawson, Boston; Frank Ford, Ravenna, O.; H. A. Johns, Sioux City, Iowa.

AMERICAN GROWN DUTCH BULBS.

To introduce my American grown Narcissus for forcing by florists I make the following special offer. *Bulbs ready now.*

	Per 100
NARCISSUS CAMPERNELLE, - -	$.75
DAFFODIL RUGILOBUS, - - -	1.50

I would like to correspond with any one desirous of going into the business of growing Dutch bulbs in America. I have a stock of 400,000, in 10 to 18 varieties.

South Carolina is the very best section of the U. S. for the growing of these bulbs. I have successfully demonstrated this, and can offer a splendid opening to a man with some capital and familiarity with horticultural work.

GEO. L. PARKER,
807 Washington St., Dorchester, Mass.

St. Joseph, Mo.

I suppose our trade has been fully equal to other parts of the country. While there has been no special gain yet we have held up to our former trade, both in cut flowers and plants, and at times exceeded. This was especially so both at Easter and Decoration Day. We found we had calls for a better class of flowers than is usual for the last named day.

In plants I was fearful that the trade would be demoralized in the early season. Like nearly all other cities, we have a couple of florists who pride themselves on cutting prices. One house started out at retail price and a discount off of ⅓ to all their customers. Two other houses sold at about fifty per cent below the usual retail price. As I have always been opposed to cutting, I held out for my prices —geraniums, 3-inch $1; 4-inch $1.50, per doz.; E. B. roses $2.50 per doz., 4-inch pots, and other things at the same rate. Our planting season is just over and our houses are empty.

D. M. REICHARD.

Coke Dust for Propagating.

Instead of using sand, Mr. A. A. Young, the florist of Jewett City, Conn., fills his propagating bench with coke dust procured from a nearby gas house. He finds that cuttings of all soft stuff root much more readily in this material than they do in sand; furthermore it is of gritty substance, never turns sour and does not soil the fingers as one would suppose. It is a waste product, the gas house people being obliged to him for taking it away. His gas bills however run as high as ever.

A. T. B.

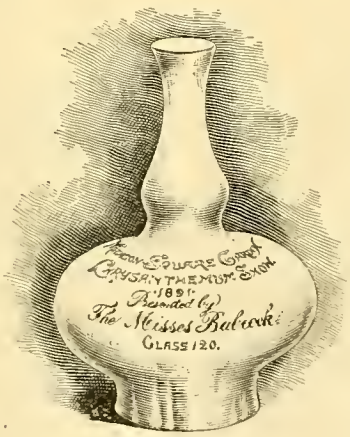
WINTER FLOWERING ROSES



We devote more than half of our greenhouses to the production of Winter Flowering Roses, and have the finest range of greenhouses in this country for that purpose; they contain every improvement in regard to durability and labor-saving appliances; the rafters and purlins are of wrought iron, securing very light roofs and extreme durability. The water is warmed in very cold weather before using by the exhaust steam from the steam-pump that supplies the houses with water; liquid manure is all pumped by steam, and everything to secure the highest development of our stock, and at the least expense, has been sought for and secured, and our new range of iron rose houses, covering two acres of ground, and **devoted exclusively to the production of cut roses,** are conceded by all who have examined them to be without question the finest range of greenhouses devoted to rose culture in the United States, and we believe, in consequence, we have exceptional facilities for supplying strong young healthy rose stock at the lowest possible prices. These houses are worth examination, as they are conceded to be model houses in every way. Visitors are always welcome.

AMERICAN BEAUTY.—The largest rose and the most vigorous growing by far among continuously blooming roses, throwing up very strong stems from the base of the plant, every shoot terminated with a single flower, which is of the largest size. Color, deep rose. In foliage and size of flower it resembles the large Hybrid Perpetual or Hardy class, and is similar to Magna Charta or Gloire de Paris. It is as fragrant as the most fragrant of Hardy roses, which, coupled with its vigor, large size and beautiful color, long stems and continuous bloom, places it at the head of Winter blooming roses. It requires skill and favorable conditions to flower it in perfection, but when successfully flowered no other rose approaches it for beauty or profit. 2¼-inch pots, **$10.00 per 100; $90.00 per 1000.**

MME. CAROLINE TESTOUT.—This rose has attracted more attention than any rose sent out since the American Beauty. It was the winner at the Madison Square Garden Chrysanthemum Show of the LANIER SILVER CUP for the best new seedling of European origin not exhibited previous to 1892, and it was constantly surrounded by an admiring group throughout the show. It is a Hybrid Tea, with a decided, though delicate tea fragrance. It is a very vigorous grower, throwing up heavy bottom shoots in profusion, and is also a remarkably free bloomer for so large and fine a rose, producing scarcely any blind wood. In form it is very similar to La France, and in size much larger. In color it is simply unequalled among pink roses, being of a wonderfully clear brilliant pink, of one solid tone, without shading of any kind. It needs no special treatment, and for a high class rose of easy culture, it is certainly unequalled. Large roses that can be cut in the half-blown state, like Beauty, are becoming yearly more fashionable and the popular taste seems to be growing in this direction; we have needed a good pink rose to meet this demand, and believe that Mme. Testout will fill the bill. Mr. Ernst Asmus says: "This is the best Hybrid Tea the French have ever sent out." Mr. W. W. Coles says: "I have grown many varieties of roses, but have never seen one with so many good qualities as the above. I shall be very much mistaken in my prediction if we do not find, within a few years, that there are a thousand Testouts grown for every hundred La France." Mr. Robt Craig says: "I want to tell you that's a nice thing. The color of Testout is its great point. In that respect it is far ahead of La France. It will keep in the cellar for three or four days, and as the color fades it keeps a pleasant shade." Growers, Retailers and Flower Buyers are alike enthusiastic in its praise, and in our opinion this rose is destined to win a high place and prove very profitable to the grower. First premium awarded us for this variety, N. Y. Chrysanthemum show, Fall, 1893. Price, 2¼-inch pots, **$8.00 per 100, $75.00 per 1000.**

Silver Cup awarded us for Meteor Roses, exhibited at Madison Square Garden, 1892, for best 25 Red Roses of any variety.

Silver cup awarded us 1891 for our exhibit of Meteor Roses; for best 100 Red Roses of any variety.

KAISERIN AUGUSTA VICTORIA.—A new rose of German origin that is attracting a great deal of attention and promises to be of great value. In color it is midway between Bride and Mme. Hoste, a delicate cream white. The buds are both larger and longer stemmed than those of Bride. The habit of the plant is singularly strong, vigorous and healthy; the flower is most deliciously fragrant. Winner of the Silver Cup offered by the F. R. Pierson Company, at the Madison Square Garden Chrysanthemum Show for the most promising forcing rose never before exhibited at a New York show. First premium New York Chrysanthemum Show, Fall, 1893, awarded us for this variety. Price, 2¼-inch pots, **$8.00 per 100; $75.00 per 1000.**

BRIDESMAID.—(Originated by Frank L. Moore.) This is the rose we have all been waiting for—*a Mermet whose color is constant* through all kinds of weather. Mermet has always been acknowledged as more nearly approaching perfection than any other pink rose, its one fault being its tendency to lose color in dark weather. In the *Bridesmaid* we have it with this one fault corrected, and every good trait unchanged. It is identical in form, habit of growth and freedom of bloom with its parent, and, unlike Waban, it never produces malformed buds. Many of the largest and most wide-awake growers about New York intend to discard Mermet and plant Bridesmaid in its place the coming season, and we believe results will prove their wisdom, as its uniform good color causes it to bring a correspondingly uniform good price, and hence makes it much more profitable. The past winter it has brought fifty per cent more than Mermet; when it is realized that it is fully as free of bloom, no more need be said on this point. We won *First Prize* two successive days at the Madison Square Garden Chrysanthemum Show, fall of 1892, for this variety. Mr. T. J. Slaughter, who has been a large and very successful grower of Mermet, voices the universal verdict when he says: "It gives me great pleasure to give the Bridesmaid my hearty recommendation; from my experience with it this year *I am convinced it will supersede the Mermet entirely*, owing to its better color and greater market value. I intend to give it all the room I can possibly spare. I think growers will go strong for it next year." 2¼-inch pots. **$8.00 per 100; $75.00 per 1000.**

METEOR.—The finest crimson rose for winter blooming; very double and very dark velvety crimson scarlet, its only fault being a tendency to become black during the shortest days of winter, but when well grown it is not excelled; a superb variety. We grow this rose very largely, and won a Silver Cup at the Madison Square Garden Chrysanthemum Show, for the best twenty-five blooms, also both first and second prizes for the best twelve blooms. We are recognized as having the best stock about New York, and are headquarters for this variety. In 1893 we again received First Premium for our exhibit of Meteor at the New York Chrysanthemum Show, and also a **Bronze Medal at the World's Columbian Exposition in Chicago,** for our exhibit of this variety. 2¼-inch pots. **$6.00 per 100; $55.00 per 1000.**

SOUVENIR DE WOOTTON.—A very valuable scarlet-crimson, much like Jacqueminot in size and color; an easy variety to flower and has a delicious fragrance. Throws good stems, but frequently in clusters, in which case, by disbudding, the size of the flower is largely increased. The best crimson Winter-flowering rose at the present time **"for general use,"** all things considered. 2¼-inch pots. **$6.00 per 100, $55.00 per 1000.**

MME. CUSIN, PERLE, MERMET, NIPHETOS and BRIDE, $5 per 100; $45 per 1000.

F. R. PIERSON CO.,

TARRYTOWN-ON-HUDSON, N. Y.

Lenox, Mass.

Lenox at this season is a veritable paradise, in which some of the most active angels are members of the gardening fraternity; everyone is very busy, but notwithstanding that fact the boys are always glad to show a stranger all the courtesy and hospitality that lays in their power.

The mansion of Mr. G. H. Morgan affords the finest views in Lenox. It is built in the Elizabethan style of architecture and only recently finished. The pleasure grounds are forty-five acres in extent and were laid out and planted entirely under the direction of Mr. J. F. Huss, the genial superintendent, who in two years has transformed the place from a howling wilderness into a triumph of the landscape gardener's art. Many large trees, in some cases sixty feet high, with frozen balls of earth fourteen feet in diameter, were moved, and of all the trees so moved (principally birches and sugar and scarlet maples) not one has died, in fact the magificent trees on the place are among its greatest attractions; the large elms, birches, maples and locust and tulip trees are unequalled in Massachusetts. Other pleasing features are a lawn twenty-five acres in extent planted at intervals with beds of choice conifers, Japan maples (in thirty-two varieties) and two immense beds of hardy rhododendrons. The kitchen garden and greenhouses are in truly English style, being surrounded by a brick wall eight feet high enclosing about two acres. Against this wall are planted trained fruit trees; the beds of the garden are bordered with cordon-trained apples. The greenhouses consist of four plant houses, added to which are rose, palm, peach and nectarine houses, all well stocked.

At the place of W. D. Sloan, Esq., everything is in the apple pie order characteristic of Mr. W. Griffin, the superintendent. The large collections of palms and ferns are in grand shape. In this class of stock Mr. Griffin has the largest and finest collection in this vicinity. A house of American Beauties he has just planted is a sight to behold.

Mr. A. H. Wingett, superintendent at Charles Lanier's, has a very fine hybrid anthurium that he expects great things of. X.

ZIRNGIEBEL GIANT PANSIES.

Owing to favorable weather, have been simply magnificent, this season, and our seed beds are a sight to behold. Never before have we obtained such size and colors, and as usual, wherever exhibited, have eclipsed everything else, receiving also the most flattering testimonials from the leading florists and seedsmen all over the country.

We will have new Seed to offer on about July 1st of our popular strains

THE GIANT MARKET AND GIANT FANCY

in trade packages of 2000 and 500 seeds respectively, with practical directions to sow and grow our pansies; pkt. $1.00 each.

Also plants for sale later on.

Now ready, from 2-inch Pots, strong plants, price, $1.50 per dozen; $10.00 per hundred.
DAILLEDOUZE BROS., Flatbush, L. I., N. Y.

Worcester, Mass.

It was the same old story Memorial Day, more stuff than ever before, and we would have sold twice as much; all the florists (of the progressive order) reported a much larger business than in 1893. There was an unusually large demand for carnations, and although we handled a good many we stopped booking orders the 28th. Roses of course were also short, in fact everything was short, but the demand for carnations and roses was the most noticeable. Lange had a hundred foot house of pink and white stock, and five hundred longiflorums, that helped to fill the aching void, also his inside pocket. The trade did not differ much from that of last year, the call being mostly for loose flowers, bouquets and baskets. Small hydrangeas, etc., in pots disappeared early in the game.

The regular trade is very fair; we are handling large lots of first-class stuff, and regular prices are still holding firm; we are also doing considerable funeral work of the best class.

The first lot of outside hybrid roses were brought in the 9th of June, which is as early as I have ever seen them; all we need now is a good crop of June weddings to use them up.

Most of the churches decorated quite extensively June 10, Children's Sunday, and gave to each child a potted plant. Florists who handle bedding stuff report fairly good sales. SEEDLING.

San Francisco.

Mr. Robt. Armstrong, for some years manager for Timothy Hopkins, Esq., at Sherwood Hall (Sunset) Nurseries, has commenced business on his own account at Mountain View, Santa Clara Co., and is going to grow cut flowers for the San Francisco market. He has commenced building four greenhouses, one for roses, one for chrysanthemums, another for carnations and one for violets. He is a thoroughly competent florist, attentive, obliging and has the respect and good will of all who know him and has every chance of a successful venture.

John McLaren, superintendent of Golden Gate Park is a hustler. The beautiful artistic carpet and other bedding is nearly all complete; the designs are excellent and the workmanship cannot be surpassed.

G. M. S.

SMILAX.

THE AMERICAN FLORIST CO.'S

DIRECTORY

AND

REFERENCE BOOK

FOR 1894

CONTAINS THE FOLLOWING:

1. The names and addresses of the Florists, Nurserymen and Seedsmen of the United States and Canada, the exact branch of the business each is engaged in being indicated.
2. A separate list of firms that issue catalogues, the space devoted to each branch of the business in each catalogue being also given.
3. A list of the names and addresses of superintendents of leading parks in the U. S. and Canada.
4. A list of the principal cemeteries of America at which the arts of the landscape gardener and florist are used in beautifying the grounds.
5. A complete, alphabetically arranged list of Roses in commerce in America, with class, habit of growth, date of introduction, name of introducer, and brief, accurate descriptions of the flower of each. Synonyms are also plainly given.
6. A complete, alphabetically arranged list of Chrysanthemums in commerce in America, with class, and brief, accurate description of each. Synonyms are noted and varieties that are very popular with American growers are designated by a star, and this year's introductions by a dagger.
7. A complete, alphabetically arranged list of the Carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each.
8. Seasonable Hints for the year, arranged in weeks, written by Mr. William Scott, and covering every detail of a general florist business. This is decidedly the most valuable contribution to the literature of the trade ever published. It is written in a plain, practical way, by a man who knows what he is talking about.
9. A historical sketch of the Society of American Florists from its organization to date, including officers for each year and lists of essays read at each meeting, with other information of interest.
10. A similar historical sketch of the American Association of Nurserymen.
11. A similar historical sketch of the American Carnation Society.
12. A similar historical sketch of the American Seed Trade Association.
13. Similar historical sketches of the Florists' Hail Association of America; of the National Chrysanthemum Society of America; of the Florists' Telegraph Delivery Association.
14. A complete list of all National and Local Trade Organizations, with names and addresses of principal officers, time and place of meetings, etc.
15. Statistics of Commercial Floriculture in the U. S. from the last census.
16. Statistics of the Nursery Industry in the U. S. from the last census.
17. Statistics of Seed Growing in the U. S. from the last census.
18. A list of Leading Horticultural Societies, with name and address of the Secretary of each.
19. Full information about Express and Postage rates on plants, shrubs, trees, seeds and bulbs.

No less than 270 pages of valuable reference matter in compact form, and all UP TO DATE.

PRICE $2.00 POSTPAID.

Greenhouse Material,

LOUISVILLE, KY.

Pittsburg, Pa.

Trade continues fair; the last week or more of fine weather has warmed things up and the bedding plants have been pushed to the utmost. The bedding stock in the markets is poor. I hear that some of the growers are keeping stuff back until the cheap, inferior plants are disposed of, as good prices cannot be obtained with so much inferior stuff in the market, which sells for little or nothing. At the same time the growers seem satisfied, and all say that the demand has been much greater than anticipated.

Work has been rapidly pushed in the parks and another week will find nearly everything planted. Little planting being done previous to the middle of the first week in June, everything came in a rush.

The retail stores have had a very fair week. B. A. Elliott Co. and A. M. & J. B. Murdoch had the decoration of the Monongahela House for the general freight agents' annual convention; it was quite an elaborate affair. The plant decoration was done by the firm first named and the cut flower by the latter. Messrs. A. M. & J. B. Murdoch have also been quite busy with several weddings. Patterson Bros. have also been quite busy.

F. Burki left for Europe Saturday, June 16, hoping to return about the first week in August.

Herbert, youngest child of Supt. A. W. Bennett, of the Bureau of Parks, died Friday, June 15, aged 13 months.

The S. A. F. convention in Atlantic City is the talk of the boys, and if all go that are talking about it the attendance from this vicinity will be large. A. J. E.

Would come through Quick.

A daily paper gives a vivid description of the beautiful sights to be seen at the local market, and eventually drops into an attempt to instruct as well as entertain. A sample of the instructive items follows:

One dealer had three or four bushel boxes of seed potatoes for sale at 40c each. The potatoes were covered with sprouts two or three inches in length, but the dealer proudly explained that they would come through the ground all the quicker with the sprouts on.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

THE LENOX HORTICULTURAL SOCIETY of Lenox, Mass., will hold their first annual exhibition Sept. 4-6. The classes to be competed for include plants, cut flowers, fruit and vegetables. Copies of the schedule may be obtained from the secretary, A. H. Wingett, Lenox, Mass.

LITTLE ROCK, ARK.—The State Hort. Society met here May 23, 24 and 25. The session was a very interesting one.

Arrangement of Flowers.

VII.

ARRANGEMENT OF VASES.

Vases filled with longstemmed cut flowers constitute the largest part of the house decoration of the present day. The banking of mantels with solid cut flowers is not practiced to the same extent as was the case in former years. For small or medium sized reception or drawing rooms and parlors especially arrangements in vases are in far better taste than heavy banking, which latter, however, in its proper place is well enough. In the present article we shall confine ourselves to a few remarks on vase arrangement in a general way.

What holds true of floral arrangements of all kinds is particularly to be observed in vase arrangements, namely avoid overcrowding. The number of flowers to be placed in a vase will of course depend on the variety used and also on the size of the vase.

In a majority of cases where your order calls for a house decoration you will find at the house great numbers of vases and other receptacles for holding flowers, often many more than sufficient. But although these might be, and probably are, in great diversity of style and shape, yet we find the larger portion very often totally unfit for the purpose. The most costly, and on that account most highly prized by their owners, are generally the worst offenders. You may find that a large and tall vase has an opening so narrow that you may have great difficulty to squeeze 3 or 4 stems of lilies into it, when it should, in order to give the proper effect in accordance to its size, hold about a dozen. Another style again will have an opening of six inches or more but so shallow that it will not admit of the use of large and longstemmed flowers, and short stemmed material, on account of its height would of course be worse than useless. Such vases may be very handsome mantel ornaments but are totally unfit for our purpose. In such cases we should insist upon being allowed to substitute some more suitable forms. Sometimes we are privileged to do this, but at other times again the lady of the house will not listen for a moment to the suggestion, and at the same time expects to have her vases filled effectively.

In such cases the vase with a large opening can be treated in a simple manner. Moss up a flat wicker dish of the required size and arrange your material in this in such a form as to carry out the effect of its being placed loose in the vase. Then place this arrangement in the vase. If skillfully done and the foliage dropped over the rim, not even an expert would know the difference. We frequently have to resort to either filling the vase itself with moss, or employ a flat form to set on top, as above indicated, in other forms of ornamental vases, particularly those of bronze, which, though roomy and of sufficient depth, do not always hold water. If the vase with an extremely small opening is sufficiently large and massive it can be treated the same as above stated, only be careful to avoid the danger of a top-heavy effect, as generally such vases are very narrow at the top. If the vase is very tall and of slender form from bottom to top you will have to do the best you can by placing the stems of the flowers in the opening.

The first step we take before we commence work is to collect all the different vases to be used in a decoration and assort them according to size and style adaptable for the class of flowers to be used. Large and tall vases are most suitable for the larger varieties of roses such as Beauties and hybrids, lilies, chrysanthemums, pæonias and the like. Medium to small sizes are best suited for the general run of roses, carnations, tulips, narcissus, Dutch hyacinths, etc. Such flowers, however, as lily of the valley, Romans, violets, sweet peas and kindred forms, require a low vase or dish.

But size alone does not always indicate whether or not the vase is just the proper thing for a certain kind of flower. Some rather small vases have a very spacious opening and if filled with as many flowers as these will hold, will look rather out of proportion. Take for instance a vase of Harrisii lilies.

The vase we illustrate is about fifteen inches high and of a style which will admit of a generous bunch. It holds 18 stems without crowding. These are arranged for a mantel or the corner of a room, the flowers being arranged for front and side view only. Now this same number of flowers if placed in a taller and more slender vase would give a decidedly top-heavy effect. A vase for displaying a couple of dozen long stemmed Beauties should be taller; that is, if the flowers are cut with stems 2 feet or more long. For medium length of stem, however, a vase of the height shown in the lily arrangement will answer. Choice specimens of Beauties, as well as hybrids, make a fine effect if placed in suitable vases holding but a few blooms.

The smaller forms of roses are suitable for the great variety of such vases as are generally found in a house, or if these are lacking you will furnish them from the stock you have on hand for such purposes, the best of all being a plain white glass vase in suitable sizes. Our second illustration shows such a vase filled with mixed roses. We purposely show this arrangement in a mixture of such varieties that harmonize in shade, as being a form often put up when the selection of stock is limited. In a first-class decoration, however, we rarely ever use more than one variety in a vase. Where we confine ourselves to but one kind we must not over-

look the great importance of having the color of the flower harmonize with that of the vase.

The vase of carnations illustrated shows a bunch of 50 Grace Wilder. Carnations, if cut with plenty of buds and on long stems, look best if set in a proper vase without any addition other than a few branches of their own green if procurable.

The last illustration is of a bowl of sweet peas. As stated above the receptacle to hold these must be low. A few branches of their own foliage are an excellent addition, but unfortunately our growers don't always take the trouble to add a few pieces of foliage to each bunch, so we have to use a frond or two of adiantum; but don't let us use it too heavily.

We shall make some further notes on vases later on when we reach the subject of decorations for various purposes, and reserve also the arrangement of orchids in vases, and other forms, for future articles.

HINTS ON STORE MANAGEMENT.

We stated at the very start of these articles that in order to become an accomplished and successful "maker-up" you must possess a thorough love for your business. But this is not the only requisite, unless your services are required in a large establishment where arrangement is your only occupation. In the great majority of situations either as an employe, or of course, as an employer, you will also act as salesman.

The late Chas. Reissig used to say that a good salesman was worth half a dozen artists. His estimation of the value of the former as compared with the latter may have been exaggerated, but it is nevertheless true that the salesman plays an all important part in a successful business. A first-class salesman, the same as the artist, is not made but born. And yet a thorough training will produce a pretty fair article of both. Deportment is largely a matter of training, and so is that all important requisite, the correct judging of mankind which is acquired through long and observant experience, but good address and a ready tongue are the gifts of nature. But one of the most important requisites of all is a thorough control of your temper. Unless you are blessed with a pretty large stock of patience and are prepared at all times to bottle up your temper with a patent stopper you had better stay away from behind the sales counter.

We will suppose it is a very busy day with you. You have a number of large orders to fill and growers upon whom you depended for certain stock have disappointed you by sending in a short supply. You have been obliged to go out and skirmish for the needed stock and with but meagre success. You return to your place of business having lost much valuable time and proceed to rush things in order to catch up, when there enters a lady customer who will be waited on only by yourself. It takes her just 25 minutes to select two rose buds out of an assortment of some 500, every one of which has been critically examined and in the process of which several were broken and the balance not showing a great improvement by handling. The price previously ascertained is $1.00 per dozen, 2-12 of a dozen is 17 cents, allowing you the extra fraction of a cent for your trouble! She sweetly hands you a $20 note to change and "won't you please put the flowers in a nice little box?" Being very considerate she proposes to carry them home herself and save you the trouble of sending! Now, if under those circumstances you are still able to politely bow your customer out of the door and with your sweetest smile extend an invitation to call again, then you may be sure that you are, as far as patience goes at least, well fitted for your calling.

A well known florist used to say that the secret of success as a salesman was ability to size up a customers' pocket book. In how far he might have been correct we are not prepared to say, but that there is more truth than poetry in this remark there is no denying. Who has not had some experience like this for instances: A couple of gentleman will enter your establishment to order something for a funeral. Appearances are sometimes deceptive and in this instance it may be very much so. You "size them up" to be good for about $25 and show something for that amount that is "the correct thing." The sale having been effected and the bill paid; your customer incidentally drops the remark that flowers must be getting very cheap, he being fully prepared to put up twice twenty-five dollars for such a design. You will then be very apt to feel annoyed with yourself. On the whole it is generally safer to err the other way. If the price is too high you are able to show something less expensive.

But before fixing the price, important as this may be, the salesman's ability must be demonstrated in another direction, equally, or even more important, and that is not to sell an article which the buyer wants but one he does not want, providing the former is hard to obtain, and the latter you have in stock in great abundance. Of course the very best salesmen cannot do this always. Some buyers manifest a decided mind of their own and you will find it a hopeless task to convert them. If a lady customer asks for violets you may not be able to sell her Harrisii lilies but if she desires La France roses and you have not got them in stock, and you know it to be difficult to obtain them on the market, you must demonstrate your ability by selling some other pink rose, and allow her to depart with a purchase of Mermets thoroughly satisfied that these after all are just what was needed.

In a general way we find our dealings with men entirely different from those with the gentler sex. As a rule a man knows the value of time and he also knows about what he wants and what amount he desires to expend, and if he don't he generally trusts to your honor as a business man to do the right thing. And as long as you treat him in a business way you will have but little trouble. Of course there are exceptions to all rules. But most of our dealing are with the ladies and bless their dear hearts, some of them will try the proverbial patience of Job. You may divide them into several classes.

First there is the professional shopper who visits every flower store within a radius of several miles before she buys 25 cents worth. She expects to be shown every flower in your establishment and is not at all backward in tumbling your stock about as though so much hay. This nuisance you are warranted in giving an occasional snub as her custom generally amounts to little.

The next is the member of the "would-be" aristocracy, who wishes to decorate her house, let us say for a reception, just like Mrs. Upper Ten, but unfortunately the pocket book is insufficiently supplied. In order to come somewhat near an acceptable figure you have to cut here, and make another cut there, and by the time you have agreed on the price and executed your job, it won't be at all like the one your customer had in mind, and dissatisfaction follows. This class is the hardest of all to deal with, and if you manage to make a profit out of them and at the same time give perfect satisfaction you may consider that you have solved a most difficult problem.

The third-class is the member of the "shoddy" aristocracy. An easy and most profitable victim. Be sure to furnish something showy. Generally expense is of but little moment and good taste of less. So long as you are able to furnish something more elaborate and gaudy than was ever seen before you are all right.

The fourth is the lady in the truest sense of the word. She is a woman of refinement and not infrequently she is able to give you an object lesson in the arrangement of cut flowers in a room that you may find worthy of grateful study. She will leave an order with you for a decoration, either trusting the adjustment of the cost to you, or tell you not to exceed a certain price. After the order is given and you commence work she will never interfere with suggestions of her own. She may have some favorite vases which she prefers to fill in her own way, and if she has she quietly goes to work and suits her own fancy. If her arrangement is not entirely in harmony with your own ideas you had better keep the fact to yourself. Never assume that because you are a florist you know it all and that nobody outside of the sacred precincts of the craft is worthy of consideration as regards flower arrangements.

The Hardiness of Plants in Northern as Compared with Southern Exposure.

[Read by Mr. J. C. Witten before the St. Louis Florists' Club.]

The location of plants with reference to the sun, shade or prevailing winds, is a subject much studied by the cultivator. The comparative effect of direct and oblique rays of light upon plants, is noticed particularly by all who cultivate them under glass, and, to the practical florist, it is unnecessary to mention the important relation which this bears to the slope of the roofs of greenhouses, the location of hot beds, etc.

To the cultivator of out of doors plants also this subject is one of vital importance, and has been noted and discussed by the horticulturist since the earliest time. The observed advantages of shelter from blasting winds or glaring sun first suggested the selection of a proper exposure for plants, and the idea of artificially supplying these conditions, developed the use of pits, forcing beds and, later, of greenhouses. Methods of accelerating or retarding the growth of plants have been handed down for centuries, for our adoption and improvement. Even the luxurious Romans, as might have been expected, however, of a people who lived so much for the stomach's sake, are said to have made quite progressive steps toward producing a succession of vegetables and fruits, by supplying or withholding light and heat.

In consideration of these facts, it is evident that the growth and hardiness of plants depends upon various surrounding conditions and environments. The prevailing winds, cloudiness or sunlight, altitude, proximity to bodies of water, color of soil and many other conditions, help to determine the exposure best suited to a plant in a given locality. For this reason, authorities upon horticultural methods,

VASE OF LONGIFLORUM LILIES.

ARRANGEMENT OF FLOWERS

referring to various localities, differ in their statements as to the proper aspect for a given plant.

In Lindley's valuable writings upon horticulture in England, great stress is laid upon the advantages of training fruit trees upon the south side of a wall, for protection against cold. The author cites ample proof of the beneficial results of this practice, and gives logical reasons why, in England, it is the most successful plan. Trees there need the heat of the sun as early in the spring as they can get it. This wall protects the tree from cold, piercing winds and also absorbs heat, which it gradually gives off during the night, thus helping to maintain a higher and more uniform temperature. By these means, the fruit is not only earlier, more abundant, of higher color and better flavor, but the growth of the tree is more perfect, and the wood more completely ripened off, to withstand the rigors of winter. The same exposure is also selected for the vine and many other plants, with similar results.

In this connection, we must consider that England has a very moist climate, that winter fogs prevail, and that instead of the blistering spring suns which scald our trees, they experience only a few hours of hazy sunlight, during the middle of the day. It is especially interesting to note, that on account of this very cloudiness, England cannot grow Indian corn, a crop which can be matured in every state and territory in our Union. Despite this lack of summer heat, however, many plants, not hardy in the vicinity of St. Louis, are wintered in English gardens with perfect safety.

Early horticulturists in America met new and changeable conditions. Instead of the mild, humid winters and damp, cool summers of Europe, they found the winters so clear and cool as to freeze many of their plants, and the spring and summer suns so persistent and hot as to scald many more. The reasons of these failures had to be studied, and new methods of culture and protection, as well as new and acclimated strains and varieties, had to be introduced, to meet these changed environments. In our own country, as cultivation moved westward, similar difficulties were met and are still being overcome. In many of our western states, where the early settlers despaired of having fruits and ornamental plants, horticulture in diversity is now very successfully carried on. Acclimatization and production of new varieties has had much to do in working these changes, but the study of proper location and, in many cases, the planting of shelter belts, and otherwise modifying the exposure of plants, has also been an important aid to success.

In localities where the winter temperature is generally uniform, and where late spring frosts, or scorching summer suns are not prevalent, a southern exposure is no doubt preferable for most plants. Where these conditions are reversed a northern slope is to be chosen. An eastern or a western slope may sometimes be preferable, especially when prevailing winds from these directions are tempered by passing over contiguous bodies of water.

The peach belt of Michigan is a good example of the influence of a body of water. A strip of country, which receives the lake breezes, is admirably adapted to the production of immense crops of peaches, while a few miles away from the direct influence of the lake, with similar soil and in the same latitude this fruit cannot be successfully grown.

Quite generally, throughout the western and inland southern states, a northern aspect seems preferable for many of our fruits and ornamentals. In these localities, away from ocean fogs and moisture-laden breezes, the effect of a clear and burning sun, accompanying or following a very low temperature, is only too well known. This is especially true, during late spring cold snaps, which frequently occur after growth has begun. In some localities, the frequency with which buds are stimulated to growth during warm spells in winter, and then frozen after they have unfolded their protecting scales, causes much damage, particularly on southern slopes.

It is a well known fact that winter buds may put out a certain stage of growth, without the aid of root action. The botanist has ascertained that, during the growing season, the plant stores up a supply of starch, most abundant near the buds, to support the next spring's growth, until the leaves are developed to assimilate food. There are a great many practical proofs of this fact. Trees cut down in winter often leaf out, or even bloom, the next spring, grow until this stored up food is exhausted and then perish. Twigs of the plum, and other early bloomers, may be cut from the tree in winter, and forced into bloom, by placing them in water and giving them light and heat. A branch of a tree, or vine, if drawn into a warm room, through a window, may be made to start growth, or to bloom, while the rest of the plant is frozen and dormant.

Right along this line, the practical florist has taken a step in advance of many orchardists. Even yet, many successful and wide awake fruit growers mulch heavily around each tree, in midwinter to retain the frost in the ground about the roots, as late as possible, under the impression that it will retard the blooming of the tree, and consequently lessen the liability of injury to the blossom, by late frosts. The florist proves the fallacy of this scheme, by planting a lilac near the greenhouse and pulling the branches indoors in winter, and forcing them into bloom, while the main plant is frozen.

Another advantage of northern over southern exposure, where fluctuations in winter temperature are common, is that plants which receive the least direct sunlight, thaw more gradually in a sudden change from cold to warm weather. The difference in effect of gradual and rapid thawing is well known. Cabbage may be wintered in our northern states by placing them, head down, right in the

field, and covering the heads to the depth of a few inches with soil. The earth freezes firmly, to a depth much below the cabbages, but the covering of soil prevents rapid thawing and consequent injury. Discarded heads, left uncovered in the same field, become a brown mass of decay. I have wintered beets and turnips in South Dakota, in this same way. As far north as Maine, potatoes plowed from the ground in spring are occasionally found to be in perfect condition after being subjected to the rigors of a northern winter.

In some of the prairie states, plantations of young trees may be commonly seen, in which almost every unprotected specimen shows a decided tendency for its north side to outgrow its south side, thus throwing the tree out of balance, and more fully exposing the south side of its trunk and branches to sun scald. For this reason, planters often lean their trees to the south or southwest, in setting. This enables the foliage to better protect the tree from southern sun and hot winds. The tree puts out its own umbrella, so to speak. Even when trees are set in this manner, the excessive growth of the northern branches will soon bring the tree into balance. Planters who began by planting shelter belts on the north side of their fruit and ornamental grounds, have changed their tactics, and are now planting them on the south side.

I have in mind some Vladimer cherry trees which illustrate the effect of scalding suns and hot winds, as compared to the freezing effects of northern exposures —one spring, in a South Dakota orchard, the trees of this variety had their southern branches apparently killed. These branches had the appearance of having been scorched by fire, until there was little sign of life in them, except toward their bases. The northern branches began growth and set fruit at the proper time. Gradually the half dried buds on the south side began to open, near the trunk of the tree first. By the time the last flowers opened on these parts the fruit on the north side was about full grown. During the season these dried branches put out some growth, nearly to their tips, but the trees remained much out of balance. An Iowa orchardist, noticing them, said he had seen similar cases in his state.

Similar conditions exist in our own neighborhood, in a much less marked degree. During the past two seasons, fruit trees, with us, have set but very meagre crops. In each case, the prime cause of failure has been an early swelling of the buds, followed by a cold snap. The present season is very marked in this respect. With us, only two pear trees have set anything like a crop of fruit. Both of these are protected on the south and exposed on the north. One of them is trained low against the north side of a wall, and is growing a fair crop of fruit, while taller trees beside it, which project their branches above the wall, are entirely without fruit. The only lilac I noticed the past spring, which had not had its blossom buds killed, was completely overshadowed by evergreens on the south, with an opening to the north.

With us, however, the wood growth of most trees and shrubs seems to be quite generally symmetrical in specimens equally exposed on all sides, to climatic conditions. While a northern exposure, in our locality, is no doubt better suited to the growth of a few species, I think its chief advantage is in retarding the flowering of very early bloomers. Where bulbous plants are set in raised beds, which curve from center to margin, the plants on the north side flower later. They are less liable to injury from frost, not only because they flower later, but because they thaw gradually, without the influence of direct sunlight, after a cold spell. This is also a point of vantage to the grower of a succession of blooms for the trade. The flowering season of a certain variety may be thus prolonged, just as the strawberry grower prolongs the season of this fruit, by planting for an early crop on a south slope, and for a late one on a north slope, and mulching the latter.

Young plants, such as are handled by the trade, are much more sensitive to climatic conditions than are old and established plants. For this reason the best opportunity for study along these lines, lies with those who grow this class of stock.

Finally, I have not presented these stray thoughts with the view of drawing definite conclusions to apply in all cases, but merely to suggest a few points for thought and observation. I believe if there is any class of men, who are awake to the requirements of their profession, it is the florist and grower of plants for the trade, whose success depends so largely upon their supplying the proper conditions to their plants. To them, no doubt, close observation along these lines is essential, and the methods adopted by each depend upon his environments.

Coming Exhibitions.

TORONTO, ONT., July 18-19. Annual flower show Toronto Electoral District Society. J. P. Edwards, Sec'y, 17 Washington Ave.

BOSTON, Sept. 5-6. Annual exhibition of plants and flowers Mass. Hort. Society.

CHICAGO, Nov. 3-9. Chrysanthemum show Hort. Society of Chicago. W. C. Egan, Sec'y, 620 Dearborn Ave.

NEWPORT, R. I., Nov. 6-8. Chrysanthemum show Newport Hort. Society. Alex MacLellan, Sec'y, Ruggles Ave.

BOSTON, Nov. 6-9. Chrysanthemum show Mass. Hort. Society. Robt. Manning, Sec'y, Horticultural Hall.

PITTSFIELD, MASS., Nov. 6-9. Chrysanthemum show Berkshire County Gardeners' and Florists' Club. W. M. Edwards, Sec'y, 103 Howard St., Pittsfield.

Chrysanthemum Notes.

The plants that were propagated during April and early May, or earlier, have most of them now made their first break, of their own volition, it might be said, and those that have not, or any others that you intend to grow to two or more flowers, if they have not yet broken into the desired number of shoots, should be stopped at once. By stopping, we mean to cause the plant to stop its growth to a single stem, and break into two or more shoots as desired. In wandering around among the growers we see, in spite of all that has been written and said upon this subject, that many accomplish this by carelessly breaking off two or three inches, and sometimes more of the stem, from the top of the plant. This must give the plant a serious check, and often cause it to send out quantities of suckers from the root, and, besides, when this manner of stopping is practiced the eyes at the top that are left are practically in a dormant condition, and will take quite a little time to swell and break, in fact sometimes so dormant that only the very top eye will break into a growth that has any rigor. The proper way to stop the plants is to break out just the end of the growth, the best way that we have found to do this, is to hold the top of the plant between the thumb and forefinger of the left hand, and, spreading the developed leaves of the end with the thumb of the right hand, rub out the tip with a careful movement of the right thumb. The advantage of stopping a plant in this manner can be easily seen, for the wood left at the top of the plant is green and soft, and the shoots will make their appearance in three or four days, while the roots have received very little check, perhaps none at all. We have often noticed that where a plant is cut back to any extent it is very apt to throw a potful of suckers, but where it is properly stopped no suckers appear, and the plant shows in no manner that it has suffered any check at all.

If you have any plants left after setting the benches don't throw them away. Everybody that has any retail trade, and the majority of us have a little, will find that there will be a demand in the fall for small plants in from 6 to 8-inch pots, that can be sold from 75 cents to $1.50. So, if you have any planted that you didn't use, try them in the way advocated by our friend Scott in his seasonable notes last summer. He says "to plant them in the benches in the houses, never outdoors, and stop them two or three times as may be required," but if they are now eight or ten inches high they had better be cut back to about four or five inches from the ground. Don't check a plant, however, at both top and bottom at the same time, that is don't cut off the top at the time you bed it out, but wait until the roots are established in their new home, then stop the plant where you desire. He then says "they should be potted up about September 1;" before the first of September we think would be better, about August 20, just before you go to the convention, or immediately after your return, and then they will have plenty of time to get their roots well established before the buds begin to set, and they will be covered, if disbudded a little, with very fine flowers when you want to place them on sale.

Too late potting is as often the cause of one-sided or deformed flowers, as anything else, although the chinch bug, if he gets a chance, is an adept in this line, but he is very easily gotten rid of when the plants are in the houses by fumigation.

VASE OF MIXED ROSES.
ARRANGEMENT OF FLOWERS.

Speaking of insects, look out for the aphis now and don't allow them to get a strong hold on your plants in the benches, but smoke until you have them under subjection, and keep them down all summer, for you must stop fumigating when the buds begin to show color, so smoke often now.

ELIJAH A. WOOD.

West Newton, Mass.

Miscellaneous Seasonable Hints.

Many of you will be very busy now planting the chrysanthemums and roses, and many will be busy fixing up the benches before they are planted. Don't use 1-inch boards if you can possibly help it. Use 2-inch plank and six inches wide; that is a convenient size to handle and gives sufficient drainage to a bench, which is an all-important point to be considered. If built especially to receive roses, chrysanthemums or carnations from one-hall to three-quarters of an inch is none too much space to leave between each plank, and if the benches are built for standing pots on it is just as well to leave half an inch space between the board. You are never sure when you will need that bench for a crop of "mums" or carnations, or something that needs 4 or 5 inches of soil. If used for the latter purpose it is all ready. If for plants and sand is needed spread over the bench. The spaces between boards can be quickly stopped up by a little sphagnum moss. You will perhaps have noticed that where the edge board is nailed fast on to the bench board there is where a good deal of rotting takes place. It is much better to put narrow strips 1½ inches thick between the edge and bench board, say every two or three feet, and nail through the strip. This gives you additional drainage, and saves much rotting. Let me repeat once more that on all new benches, and in fact at all parts that come together a heavy coat of water lime thoroughly rubbed in with a whitewash brush will double the life of your bench.

Don't forget when you are clearing out your houses to pot up a few plants of those things you want for stock and which don't lift well in the fall. A few of each is enough, unless your business calls for a large quantity—such plants as lemon verbena, lantanas, heliotrope and others. Plunge them out of doors with your other plants in the frames, and they will take up but little room. Select what fuchsias you want for stock and keep them growing indoors till middle of August. Then they can be ripened off for a few weeks out of doors.

A plant that is always in great demand with us for both filling large pots as well as being invaluable in boxes, vases, etc., is Nephrolepis tuberosum. Some may consider this not nearly as good as others of this beautiful genus of ferns. It is, however, much the most useful and most difficult to buy in the right size. To increase your stock of it begin now by planting a few dozen plants of it on a bench in a house that is not less than 60° in the winter months; give it 5 or 6 inches of rich light soil. If one-third of it is well rotted refuse hops so much the better. Its spreading wiry surface roots will send up a number of young plants, and can when rooted be easily detached and potted. I never saw good plants of this most useful fern go a-begging for a buyer. If this is done at once the young plants will be the right size for next spring's business.

In this torrid time with all the shade and no fires your cattleyas and lælias that are on blocks and baskets will need a great deal of water, that is, those that are now making their growth. Great orchid growers, as are those of Europe (especially Great Britain), who write on orchid culture have not written for our climate, and therefore some allowance must be made for our much hotter and dryer summers and extra fire heat in winter. It is almost impossible with the hose to thoroughly water the above mentioned when in baskets or on blocks, and it is time well spent, if you wish to have the best results, to get a tub of water and give them a bath of a few moments twice a week. Dendrobiums, particularly nobile and Wardianum, that have nearly made their growth should be removed to a lighter house that they may gradually ripen up their growth. Cœlogyne cristata will do finely out of doors, providing it does not get direct sunlight on it, and while growing should get a copious syringe every day.

If a long hot dry spell is coming and sweet peas are an important crop with you, remember they like plenty of water and are soon attacked by spider. Mulch between the rows with long straw manure; you can then water them much better and it will do more good, and don't forget to syringe the vines whenever you water.

WM. SCOTT.

Foreign Notes.

Rhododendron Smirnowi, flowered for the first time at Kew last year, is a striking dwarf species from the Caucasus. The plant at Kew is described as only 10 inches high, yet nearly 2 feet in diameter, the leaves and flower trusses being about the same size as the ordinary garden types. The leaves have a thick layer of pale brown felt on the under side, a peculiarity heretofore confined to the Himalayan species. The flowers are wide and shallow, three inches across, with frilled edges; color pale rosy purple with reddish spots on the upper petal. It is perfectly hardy in England, but we believe has not yet been tested here.

Two new cyatheas, C. pygmæa and C. Mastersiana, recently received first-class certificates from the Royal Horticultural Society. The first named is of dwarf growth, attaining a height of about 3 feet, and forms a very graceful head. Mastersiana is taller growing, with elegantly arching deep green fronds. Both are natives of South America.

Heliconia illustris rubricaulis, recently certificated by the Royal Horticultural Society, is a variation from the species having bright carmine mid-rib and veins, and occasional flecks of pink in the foliage. It makes a very striking decorative plant, and is said to be more robust than the type.

Adiantum Clæsianum, recently introduced from South America, has short fronds divided into broad pinnæ, pale green in color, blotched and radiated with white. It is a handsome fern, and likely to prove useful.

Rhododendron jasminiflorum roseum is a new and graceful Malayan variety, which has flowered at Kew. The type has thick, leathery leaves in whorls, and terminal umbels of from three to ten pure white flowers; this variety roseum blooms much more profusely, having as many as eighteen flowers in an umbel, and the color is soft carmine rose. It is a native of Perak.

Among new roses of 1894 is Lorna Doone, a Bourbon sent out by Paul & Son. It is a deep crimson shaded with

scarlet, full and double, and is expected to prove a valuable sort for bedding.

Carnation Notes.

In planning a house for next season the question may come up, "Shall I use solid beds or benches?" With many this is no question at all, for they never give solid beds a thought. But, honestly, isn't it a bit annoying to find when you clean out your houses that the benches need renewing, and are not these benches quite an item of expense? This side of the question alone should make one willing to try the experiment of solid beds.

In looking at a question of this kind the first and principal object we are aiming at is to have extra fine flowers. In my soil there is not any question but that I can get better flowers and better stems from the solid beds than I can from the benches with most varieties. To get the best results we do not plant them very close, keep them well tied up without crowding the plant together, keep the beds clean from weeds, and about twice a season put on some pure bone, working it well into the soil. In addition to this every two weeks the plants are carefully disbudded.

Another very important point in carnation culture is to have the crop come in at the proper time, that is, the heavy crops, for nearly all carnations will make heavier crops at certain times. There is less of this cropping from the solid beds than there is on the benches, but the flowers are a little slower in coming, and to get the best results from solid beds they should be planted from August 15 to September 15, not later than the last date, so that they get properly started by the time you want flowers. Planted at this time and handled properly as to temperature, which should be regulated according to the condition of the plants, they will produce their first heavy crop about the holidays, and that is generally about the time you want them. You can in a solid bed hold your crop better than you can on a bench, and on a bench you can force it better for a certain time or occasion, so that it is six of one and half a dozen of the other on this side of the question.

There is still another important feature in carnation culture for profit, and that is to get a good big crop of bloom from your plants. Here I think the bench has a little the best of it, at least between the months of October and May, the time when carnations are in the most demand. But the difference is not enough to make up the extra expense of benches.

Occasionally we find a variety that will do much better on a bench than in solid beds. A striking instance of this is Aurora. Last season planted in solid beds it was almost poor enough to be called a failure; this season planted on benches it is so fine that prominent carnation men who have visited here did not know it to be Aurora. I said in a former note that the benches were about ready to throw out, or rather the plants on them, but this bench of Aurora is an exception; it is full of flowers and buds now and gives promise of continuing so all summer.

Mr. Bridge in a former number of the FLORIST has championed the bench system so ably that it is not necessary to add anything more to it. He gives the whole secret of success in bench culture, and that is manure, manure and manure again. Start out with soil not less than one-third manure, give it a mulching of manure in January and again in March, and water occasionally between these dates with manure water. This method is a bit hard on the constitution of a plant, but then the forcing plant and the plant for propagation should be two separate affairs entirely.

In building or changing your houses this summer it may be worth your while to think over this and make up your mind to try a solid bed or two. Nearly all the growers around here are using solid beds almost exclusively, and are well pleased with the results. But possibly your soil may give different results, and it will be well to try the experiment on a small scale before adopting it. If you are successful with solid beds you will be in quite a few dollars on bench materials and have a much nicer and cleaner house.

ALBERT M. HERR.

Annual Rose and Strawberry Exhibition of the Massachusetts Horticultural Society.

This time honored show came off for once on schedule time, June 20 and 21. It is not often that the clerk of the weather arranges for joint maturity of both roses and strawberries on the exact date set by the exhibition committee six months previous, but this year he evidently tried to be agreeable. Roses vary somewhat in earliness according to soil and location, and for those growers with light soil and favorable exposure a few days sooner might have been more satisfactory, but for the majority of the exhibitors the date could not have been better selected.

The roses filled the entire upper hall, and more than one-third of the space was utilized by M. H. Walsh, gardener to J. S. Fay of Woods Holl, who has for the past two or three seasons been coming up to these exhibitions "loaded for b'ar," and has given the local rose growers a hard tussle in most of the important classes. The southern shores of Cape Cod and Rhode Island undoubtedly enjoy the best climate for outdoor roses in this part of the county. Other large exhibitors besides Mr. Walsh were James Comley, gardener to F. B. Hayes, C. M. Atkinson, gardener to J. L. Gardner, W. H. Spooner, Sumner Coolidge, J. Eaton, Jr., J. Kenneth Finlayson, gardener to Dr. C. G. Weld, Mrs. J. M. Clark, Mrs. E. M. Gill and D. F. Roy, gardener to E. S. Converse.

The blooms were shown for the most part in the flat green trays as heretofore, but a strong preference has developed among the exhibitors and others in favor of small vases, and it is probable that the days of green boxes are about numbered, and that they will soon follow the old chrysanthemum flats and enter permanent retirement. The only seedling shown was the fine deep colored Michel H. Walsh, which is now exhibited by Mr. Walsh for the second time, and fully maintains its excellent character. Among the newly introduced varieties that showed up well were Margaret Dickson, Jennnie Dickson, Crimson Queen, Brighton Beauty, James Brownlow, Gustave Pigneau and Souvenir de Alphonse Levallee.

Earl of Dufferin when perfectly fresh was good, but its tendency to turn purple told against it. Spenser, Duke of Fife and Capt. Haywood will have to improve greatly over their appearances on this occasion if they are to find any admirers here. Barden Job, a new hybrid tea shown by W. H. Spooner, is a semi-double of very brilliant color, but such a name is a heavy burden for a rose to carry through life. After all, the improvement in roses is not very pronounced, and it looks as though it might be a long time before the new candidates for popularity can excel in beauty and finish such old varieties as John Hopper, Souvenir de Wm. Wood, Mlle. Eugenie Verdier, Prince Camille de Rohan, Marshall P. Wilder, Duke of Edinburg, Prince Arthur, Eclair and Baron de Bonstettin, all of which were shown in wonderful perfection. Mme. Prosper Laugier, which has been rated as a rose of second quality, was represented by blooms which were pronounced by many to be among the handsomest flowers in the hall.

The display of orchids occupied the space in front of the stage in the lower hall. In J. L. Gardner's contribution were some nice specimens; Odontoglossum Pescatorei was the best plant of that variety in the hall; Cattleya Mossiæ and Dendrobium Dearii were also good. Edward Butler showed a grand Lælia purpurata of remarkable color and bearing seven flowers on the spike, also a fine Dendrobium alba sanguineum. The large specimen Cattleya Mendelli, Phalænopsis grandiflorum, Miltonia vexillarium and Selenipedium Wallisi from E. W. Gilmore were also worthy of note. The hard wooded ericas from J. L. Gardner's were fine healthy looking plants, considering that they had had to stand a temperature of 90° to 100°. Mr. Atkinson is most skillful with these difficult plants. From Dr. Weld came specimens of Boronia elatior, Rhyncospermum jasminoides and Anthurium Scherzerianum.

In the promiscuous classes of cut flowers there was an extensive display. There were eight or ten entries for the sweet william prizes. W. H. Cowing's collection of this old fashioned favorite included forty-six varieties. Other contributors were E. Sheppard, E. S. Converse, F. S. Davis, Bussey Institution, A. L. Cain and Dr. C. G. Weld. W. A. Coburn and E. Sheppard & Son showed fine collections of pelargoniums, T. C. Thurlow and O. B. Hadwen, pæonies, L. T. Seaver, pansies, M. T. Goddard roses and campanulas, Rea Bros., hardy perennials, R. & J. Farquhar, larkspurs, and several exhibitors showed wild flowers in profusion.

The strawberry section was remarkably fine, there being over one thousand quarts shown, and not a bad one in the lot. The wonderful new berry, The Marshall, won four out of five of the special premiums. Warren Huestis won the first prize with this variety, although its originator, Mr. F. M. Ewell, was on hand with one hundred quarts of it.

The attendance of gardeners and others directly interested was very large, and when chairman Woodford marshalled his committee and invited guests for lunch at the Tremont House he marched forth followed by a mighty host, but there was room enough for all.

Boston.

Outside of the rose and strawberry show the only event of the week to vary the dull monotony of summer was a little picnic party of a few of Mr. Ed Hatch's friends to his seaside cottage at Scituate. This took place on Boston's own special holiday, Bunker Hill day. One of the

VASE OF GRACE WILDER CARNATIONS.
ARRANGEMENT OF FLOWERS.

number was Mr. Alfred Dimmock of London, who disclaimed with much vigor any interest in the event commemorated by the day, but managed to enjoy himself thoroughly notwithstanding the somewhat embarassing questions raised by his participating in this particular celebration.

D. Zirngiebel is cutting some candytuft which is remarkable for size of bloom and spike. Some spikes measured seven inches in circumference.

Mountain laurel is being brought to the city in large quantities. It is unusually fine this year and appears to be growing in popularity for decorative purposes.

New York.

The weather has been extremely hot, and there is an almost complete cessation of everything in the line of flower trade. Many growers have refrained from throwing out their plants in the hope that at the last moment a short revival might be experienced, but it is plainly not on the program for this year. The flower store windows are decorated in the most inexpensive manner possible, and the clerks inside, reduced in number to midsummer allowance, lean listlessly over the counters and watch the perspiring procession pass the door.

A transitory topic for speculation and gossip is a scheme which an enterprising individual has evolved and has already put in partial operation. This contemplates nothing less than an organized force of flower girls, all in uniform costume, who are to operate the beaches, hotels and other places where susceptible people do congregate. A dozen or fifteen of the sirens have already commenced business, the office buildings down town being the base of operations so far. The daily papers have given the scheme considerable notice, and it would appear from the comments therein that New York is overflowing with romantic gentlemen who cannot eat or sleep until they have an opportunity to invest their money with a pretty girl in exchange for a button hole bouquet. The projector claims that this enterprise has been in successful operation in Chicago for a year. New York cannot afford to lag behind Chicago in such things as this.

Philadelphia.

If a few of the days of last week had been tagged with either a July or August label they would not have seemed so out of season. There are plenty of flowers for a good business and as a consequence may go to waste. All the large roses are off and many of the teas are feeling the effects of the hot weather. The last few days have been scorchers and a few more such will make what few roses there are look very bad. There are a great many carnations about, which flower seems to stand the roasting very well. Good ones can now be had as low as 50 cents per hundred, with $1.50 as the extreme for the fancies.

Edwin Lonsdale has had some very fine white iris, which have sold well; also some other colors. They might be called the poor man's orchid; they sold at from $3 to $4 per hundred. The same grower has quite a lot of the genuine aristocrat, but as his fellows are fast moving out of town the sale is limited.

Our friend W. K. Harris has made a discovery. It is not a new rubber, but a new use for the variety he now grows. He has found out, or some one has told him (and he firmly believes it), that rubbers are death to flies, and one or two healthy specimens are sure to rid a house of these pests in short order. A new "ode" with wings to it is now in order.

The genial Harry Bayersdorfer is back again among us safe and sound and with him a host of novelties. Harry thinks no more of a trip to Europe now than he used to of a little run down to Baltimore whenever he got tired.

Some one from Pittsburg says they will have a team to represent the smoky city at Atlantic City in August next in a bowling match "if any." Well now we just want to say right here, that there is going to be a ten pin match such as never was before, during the convention week at Atlantic City, and we are glad to hear that Pittsburg is coming in and we hope that her team will stay and be very close up at the finish.

Arrangements for the convention are progressing, and in a short time there will be lots of news for members of the S. A. F.

John Scallen of New York, was in town last week and went to Atlantic City to attend the annual meeting of the order of Elks. M. P. Norton, of Boston, W. Gude, of Washington, and A. M. Herr, of Lancaster, were also there on the same mission. K.

Chicago.

With the closing of the schools this week the season is practically ended. The closing weeks of the season however are not attended with any great rush. The demoralized condition of the market is evidence enough that the demand for June is very light. The only thing sought after is A 1 rose stock, which is hard to obtain; in fact a first-class rose is an unknown quantity. Here and there we may note a small lot of Kaiserin, which later comes forward as a superb summer rose, a few fair La France and Meteor. These varieties readily sell at $3 to $4, but the bulk of the supply, which by the way is growing less every day, is almost totally unfit for use. In lots of 500 and upwards this stuff is disposed of at $5 to $10 per 1,000.

The young stock planted early and intended for summer cutting, which promised well a week or ten days ago, has suffered greatly from the heat prevailing for some time past. Despite all efforts of the grower mildew has attacked the young stock, in some places quite seriously.

Carnations are in light demand at from 25 to 60 cents. A few fancy still holding up to $1.50 to $2. This week will finish pæonies kept in cold storage. The demand for this flower has kept up fairly well and prices ruled steady at 35 to 50 cents a dozen. Lilium Harrisii is in steady demand at $8. Outdoor grown candidum is now in. Some fair blooms of these are shipped across the lake from Michigan, but these meet with but limited demand at from $1 to $3, according to quality. Sweet peas, now from open ground, continue to flood the market. There is practically no market quotation for this flower, the dealer being able to make his own price whether in small or large lots. There is little or no demand for the rest of outdoor stuff such as corn flowers, campanula, sweet williams, poppy, etc.

At the meeting of the Florist Club Thursday of this week Mr. F. F. Benthey will read a very interesting paper on the history of the cut flower trade in Chicago.

"Egandale," the summer residence of Secretary Egan, of the Horticultural So-

ciety at Highland Park, is now a beauty spot. The very great variety of hardy plants that Mr. Egan has managed to plant on his 5½ acres without undue crowding is really amazing. His place is a gem and has been well described as "the biggest little place in the country." And the beneficial influence of this place upon other residents of Highland Park has been very noticeable. This section will soon be dotted with beautiful grounds intelligently planted and cared for, many covering large areas, particularly along the lake shore. Those who have never happened to visit this section will be surprised to see so much natural beauty within so short a distance of Chicago. Along the lake shore the country is broken by picturesque ravines that need simply to be let alone. The hand of man cannot add a single charm. One of these ravines runs through Mr. Egan's grounds, and he has wisely done nothing except what was necessary to preserve its natural loveliness and to make it possible to enter and enjoy it.

Toronto.

The regular meeting of the Gardeners' and Florists' Association was held last Tuesday, 19th inst., and considering the state of the weather and the time of year it was fairly well attended. During the hot weather it would not be a bad idea to have meetings in the open air in one of the parks, "recubans sub tegmine fagi" as the Latin grammar used to put it.

In spite of the heat, however, a good deal of talking was done, and some business cleared off the board. Two new members were elected and two nominated. A committee was appointed to consider the most suitable place for the Association to take its annual outing, and in order to give the committee something to work on there was some discussion on the subject. Some favored Niagara Falls or Hamilton; others, considering the hard times and the desirability of getting out as many of the members as possible, thought that one of the many pleasure resorts within a few miles of the city would be better. It was also decided that the Association should have several afternoons during the summer for playing cricket, quoits, etc., at Exhibition Park. Other traders have their weekly half holiday, why should not the poor gardeners and florists do likewise? The president and secretary were asked to look into the matter of finances for the chrysanthemum show prize list. It was hoped at one time that the prizes would have been considerably larger this year, and these hopes may still be realized yet, but there will have to be some work done. The ambitious city of Hamilton will this year hold a chrysanthemum show under the auspices of their Electoral District Society, which is in receipt of a government grant, so that Toronto will have to look to its laurels. It would be a pity, however, if these two shows should be held in the same week, but the Toronto show having no government pap to depend upon must if any way possible take in Thanksgiving Day (not a fixture in this country) which may occur on either the first, second or third Thursday in November.

It being still only 9:30 p. m. when all the regular business had been got through with, Mr. C. Tidy, chairman of the committee to consider the advisability of having a florists' section of the association, asked for suggestions from members present, and a pretty lively discussion was indulged in, several members branching off into the various peculiar phases of trade this spring. In connection with this the remarks of "Mack" of Baltimore, on page 1117 of the AMERICAN FLORIST, are extremely apropos.

Many of the florists are left with a large over stock of plants this season; in spite of low prices there has not been the demand from the general public either at market or at the stores. Economy amongst all classes has hit this line of trade a hard blow. E.

Buffalo.

We have been having some real tropical weather of late; at least when the thermometer is up to 94° in the shade we people of this usually cool city think it's warm. But a gentleman from Indianapolis told me last week they did not think it warm there till the mercury went up to 106°. Anyway it's what we want, and the flower beds are now getting a move on them.

Carnations are very plentiful and price down. With this weather they are short lived. Indoor roses are poor with the exception of Beauties. Brides have been very scarce, perhaps because so many weddings large and small has made the demand unusually large. Outdoor roses have been coming in the past two weeks, and sold for all sorts of prices, mostly very cheap. A few nice gladiolus spikes are coming in from some carnation houses at Corfu.

At last one of the largest dry goods houses has gone into cut roses. They have for some time sold books, bicycles, shoes and candy and perhaps many other things not in their legitimate business, but the cut flowers is their latest venture. However, it's a free country if not a highly moral one, and as the proprietors of this rich concern are looked to as models of fine citizenship and pillars of churches besides, whatever they do will be considered all right and even *smart* by the unthinking common herd. As it is, at present the stuff they are offering is utter rubbish and would disgrace any respectable flower store, so no harm is likely to be done.

We read in notes from several other cities in your columns that there has been a good deal of cutting and slashing in prices of plants this year. Very sorry to hear it. In this city I have not heard the first word on the subject. Prices on all the leading plants were as near as possible what they have been for several years past; $1.50 per dozen for geraniums in 4-inch pots, $1 for coleus in 3-inch; $3 to $3.50 for cannas, etc. These have been the same for years with no sign of any weakening and there is demand enough to use up all the stuff. The market don't hurt, for they get on an average better prices than some of the leading greenhouses sell for. I beg to say with due respect to other cities that the undersized scrubby stuff I have seen offered in other cities for bedding plants would not go here. W. S.

Cincinnati.

A few years ago June was looked forward to by the florist as one of his best months. But the different boards of education throughout the country generally have taken many dollars from our retail stores I have reference to commencement exercises. Basket work is always pretty when well done, but these said boards of education saw the feeling that existed at graduating time, when some favored or wealthy young lady would have so many floral tributes that it would take an extra carriage to haul same home, while next to this said young lady would be another not blessed with this world's riches, but with an intellect equally as good; this young lady possibly would not have a single basket. Therefore the action taken by the different boards is certainly justified in doing as they did. This of course does not hold good in all states, but it does in Ohio. Across the river in Kentucky they still give flowers in profusion. Harry Edwards of Newport, Ky., tells me he furnished fifteen baskets and several hand bouquets for their commencement last week. Geo. Meek of Covington, Ky., also had a nice trade. In Kentucky they handle the flowers in this manner: The exercises are divided in two sections; as each scholar finishes his or her address the flowers are brought in and placed in a half circle on the front of the stage and by the time all are through speaking the stage front is handsomely decorated.

L. H. Kyrk & Co. showed us a handsome orchid bouquet, the edges of which were trimmed with lily of the valley and adiantum. The combination was certainly beautiful. Trade in general is getting very dilapidated and comes and goes by spells. The recent rains are helping the carnations planted outside as well as filling up the ponds and cisterns.

The Hoffmeister Bros. are now building three new houses 30x115 feet for growing roses and carnations; they also have several small houses. While they are young in the business, yet they are doing some substantial work and expect to grow good stock this fall. Their sisters are running a store on Elm street and doing a nice business.

Ernest Preston, "For W. Rendigs, assignee for Chas. J. Jones, Jr.," is now selling said stock, which is bringing fair prices. They intend selling boilers, pipe and houses.

Colonel "Policy" Bill Smith, who is an amateur grower and one of our prominent citizens, had two wagon loads of palms and other plants stolen from his yard one night last week. Wonder who of our boys got them. Whoever did has a splendid hiding place, as they have not been heard of since.

Carl Hespler of College Hill, O., is building two new greenhouses. Mr. Hespler has been in the employ of Walter J. Gray for the past four years, is an industrious man and an all-round grower.

Henry Behrens of Middletown, O., was in the city Tuesday. Mr. B. is the only florist in his city and has quite a nice business.

The Cincinnati florists expect to give a picnic sometime next month. G.

St. Louis.

The warm dry spell still continues, and while good rains have occurred all around this country, their only effect is to lower the temperature for a day or so. The occurrence of a drought of the severity of the present one, has never been experienced this early in the season; such things are to be expected during July and August, but the idea of its opening up in May and running through the summer has been unheard of heretofore. Water in many places is becoming scarce, and all outdoor stock, where it cannot be applied, is suffering severely. In the cemeteries where there are no adequate provisions for using a hose, the procession of watering carts and wagons is continuous, and with all this exertion it is hard to keep things looking fresh and healthy.

In going through Mr. Jordan's houses lately a large number of fine latanias were

BOWL OF BLANCHE FERRY SWEET PEAS.
ARRANGEMENT OF FLOWERS

noted; they have been for the last year or two going more heavily into palms, to the exclusion of cut flowers, in explanation of which it is said cut flowers can generally be bought when wanted, and if not grown no serious results will be apprehended in times of plenty. Two houses of palms in 4 to 6-inch pots were especially good, and will make excellent stock for next season's trade if well grown during the summer, a peculiarity of this stock being the firm stocky growth, owing to the cool treatment given. A house of sweet peas up to the glass were about over, but have been cutting heavily since early in the season. Several benches of ferns were noticed in excellent condition, they being principally cuneatum, although several batches of capillus major and trapeziforme were doing well. Quite a patch of carnations are planted out, those in the houses being over; they are looking well and would appreciate a good shower. Hinze's White is still the standard of its color, and Portia leads the reds. The new varieties are all tried, but have to excel the old ones before being given preference. Tidal Wave was much liked during the past season, and will be more largely grown this year. The roses show the effects of the advanced season and replanting will commence during the end of June. Several large blocks of ground planted in narcissus explain where the seemingly inexhaustable supply came from during their flowering season; a number of hardy peas are a mass of flower, giving quantities of white for all kinds of work. The Jack roses also, which were severely hurt by the late frosts, are throwing a second crop of excellent flowers. The city boiler inspectors had just finished going over the three steam boilers, as required by law; they having been stirred up recently, owing to the failure of an ordinance exempting boilers used for heating purposes from inspection to pass the city council.

Two members of the committee appointed to report upon a suitable place for holding a picnic, Messrs. Benecke and Ellison, assisted by Doctor Helwig and Charles Young, visited Meremec Highlands to see what they had to offer, and we are all informed on good authority that as soon as they had arrived and refreshed the inner man, an adjournment was had to the bowling alleys, which were not deserted until train time. So that it is evident the committee is competent to report. The alleys were furnished with solid balls, and the scores were ludicrous, Benecke making 74 and Ellison making four poodles in four successive frames. If it is decided to go there however finger balls will be taken as a matter of course, so that respectable scores may be looked for.

Two special prizes have been announced thus far for the fall show, one of $15 given by Dr. Keith for best vase of American Beauty roses, the other, by Hill & Co. of Richmond, Ind., for best 12 blooms chrysanthemums, one or more varieties, introduction of 1894, consisting of two prizes, $15 for first and $10 for second.

R. F. T.

Indianapolis.

Decoration Day trade at this point was satisfactory. Trade in general was good during the end of May and beginning of June, owing to weddings, funerals and commencements. As usual these occasions came very much bunched, making flowers scarce. Since June 15 trade has been practically dead. Market florists complain very much; some market mornings flowers can't be sold at any price. While some plant men have sold out nicely, many have considerable stock left. The average market stuff has been poor; no doubt raising cut flowers and good plants does not work together in small places. Pot roses do not seem to receive any attention, though good plants will sell at any time.

At the regular monthly meeting for June the Indianapolis Florists' Club considered some important business, especially the recent order of Supt. Chisslet of Crown Hill Cemetery. The secretary was instructed to correspond with the prominent cemetery superintendents in regard to planting flowers on graves and in separate beds. The rule adopted by Supt. Chisslet forbids any planting of flowers and shrubbery, only cut flowers and vases of plants to be allowed. With the assistance of the daily press and many lovers of flowers this rule, it is believed, will be set aside.

A paper written by Wm. Bertermann, "The cut flower business up to date," was ordered re-read at the next meeting, as the late hour prevented discussion. A committee consisting of John Hartje, Wm. Langstaff and F. B. Alley was selected to provide for the holding of the regular annual picnic. The committee will see that a proper place for fishing is selected; solid refreshments will be provided and the third member will furnish all necessary amusements.

Mr. Anthony Wiegand and wife left for California without notifying the club members; he will find himself in a fix when he returns, explaining why he forgot to set up the cigars and cider.

Mr. John Bertermann also did something without the consent of the club; he must answer at the picnic for this neglect. He quietly married and is happy.

Miss Emma Dorner of Lafayette has been visiting Indianapolis friend for several weeks; she came to attend the "Mannerchor" celebration last week. The grand concert given by this society at its fortieth anniversary, assisted by Columbus, Cincinnati and Louisville societies, was the most successful ever held here; the display of flowers was profuse. The late May music festival was remarkable for the absence of flowers, many great songsters being present. A bouquet placed by the committee in the reception room was fired out by one of the singers; asked for a reason, she claimed it was injurious to her voice and gave her headache. What next won't these people do to advertise themselves? A newspaper clipping has gone the rounds in regard to this matter, supposed to come from a doctor in Paris, who said the scent of flowers destroys or injures the voice. This is I think ridiculous; I have enquired of local singers, and they agree with me and wonder that newspapers copy anything of the kind.

Mr. McKeand, city florist, has furnished several parks with flower beds from the greenhouses at Garfield Park. W. B.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By young man, 24 years old, as assistant in a commercial place. Good rose grower. Best of references. Address K L. care American Florist, Chicago.

SITUATION WANTED—By experienced gardener as working foreman in good commercial or private place; married, age 34. Address J. E. S., care Girdwood, Phillips Square, Montreal.

SITUATION WANTED—In either commercial or private place by experienced florist and landscape gardener. Best of references. JOSEPH SIKNTA, 523 Lincoln St., Chicago.

SITUATION WANTED—By a young florist and gardener, Danish, 23 years old, 8 years experience, 7 in this country; best of reference. Address JOHN LEVERIN, 1380 Broad St., Providence, R. I.

SITUATION WANTED—By a second man, commercial or private place. Well experienced also in landscape gardening. Wages moderate. Best references. F H H, 155 Harrison Ave., Boston, Mass.

SITUATION WANTED—By a young German florist, 8 years' experience in growing roses, carnations and general greenhouse work. Address C W, care Garfield Park Rose Co., 1888 Madison St., Chicago.

SITUATION WANTED—J. Kirkwood is open to engage with any lady or gentleman, as gardener. 25 years' experience in the growing of vines, peaches, orchids, stove and greenhouse plants, etc. Apply J. BENNETT, 2332 St. Catherine St., Montreal, Can.

SITUATION WANTED—Orchid grower; special for orchids; 10 years' experience in several of the most important nurseries in Holland, France and Belgium; 25 years old, Dutch nationality and best references. Apply to H. H. VOORNEVELD, South Framingham, Mass.

SITUATION WANTED—As assistant on private place; single, age 27; 12 years' experience in all branches of gardening. Have worked several years on one of the leading private places in the country. Best references. Address J F F, care B. Fagan & Son, Islip, N. Y.

WANTED—A good second-hand hot water boiler and 1500 feet of 4-inch pipe. I. L. PILLSBURY, Macomb, Ill.

WANTED—Sober, reliable man, experienced in rose growing, also capable of taking charge. Address GEORGE ANDERSON, 5220 Woodland Ave., Phila.

Quote size and prices to
NOVA SCOTIA NURSERY, Halifax, N. S.

ASSIGNEE'S SALE OF GREENHOUSE PLANT.

The C. A. Reeser Greenhouse Plant at Springfield, Ohio, will be offered at Public Sale, Tuesday, July 10th, 1894, at 2 o'clock P. M.

This is one of the oldest and best established plants in the State, and is now in complete order and will be sold as a going business. At the same time there will be offered a Catalogue List and Order Sheets containing names of over forty thousand customers. Also a large stock of plants, seeds, pots and greenhouse implements.

Said plant consisting of four acres of real estate, with all modern improvements, and a good and substantial residence thereon, is appraised at $7,340. Catalogue list is appraised at $1,250. Terms cash.

For particulars address

ALBERT H. KUNKLE, Assignee C. A. Reeser, SPRINGFIELD, O.

Field Roots and Green Forage Crops.

[Read by Mr. S. E. Briggs before the American Seed Trade Association at Toronto.]

MR. PRESIDENT:—As I have been asked to read a paper on "Field Roots and Green Forage Crops for Stock Feeding," will endeavor to give an outline as to what we grow and the mode of cultivation in Canada.

Many of you now assembled come from climates varying so widely with that of Canada that what I shall say may differ materially with your experience, for the reason, climatic influences necessitate the growing of different crops and with varied modes of cultivation.

For purposes of stock feeding during winter, the growing of field roots constitute one of our staple crops; more particularly does this apply to the Province of Ontario, not only because of having the largest acreage of cultivated lands, as compared with the other provinces of Canada, but our climate, soil and mode of cultivation are more favorable to their growth and development.

The extremes of heat or cold during the growing season are ill adapted to successful cultivation of most varieties of field roots. Through the months of July and August we experience high temperature; during this season the young plants of Swedes and turnips make but little root growth; with the advance of season, and while the sun is giving us warm days the nights become cool; it is when this change sets in that the root begins to make its best growth; one week of such weather produces a greater change in the development of Swede crops than a month's growth during the warmer part of the season.

Mangels and carrots make their growth more uniformly from time of seeding until gathered in the Fall, and may be more successfully grown in warmer latitudes than Swedes.

Stock raising and feeding is a leading agricultural pursuit in Canada, and as a large amount of profitable food is required for the winter it is evident that field roots are recognized as such, from the vast acreage annually grown, and though the acreage for corn growing is annually increasing and silos are being constructed on every hand, there is also increasing acreage in root crops.

The rapid growth of our dairying industry requires the corn for the production of milk, but for fattening and carrying stock through the winter, roots are found to be most profitable.

Of the various root crops grown, Swedes or rutabagas constitute the largest acreage, and chiefly the Purple Top varieties, Bronze Top, Green Top and White Swedes are also grown, but in very limited quantity when compared with the Purple Top sorts. The Swede is especially adapted for winter storage, and may be safely carried until June if housed in properly constructed root cellars. The white and yellow fleshed turnips, which we term "Fall feeding sorts," are unsuitable for winter storing. The white fleshed varieties lose their feeding value by January; the yellow fleshed turnips may be carried until February, but then become spongy and worthless.

Mangel wurzels are next to Swedes in order of acreage grown; they yield a larger bulk of feeding substance per acre, and are specially valuable for feeding milch cows. As a winter storing crop they are unsurpassed; the golden fleshed tankard can be carried until October of the following year.

Carrots, while not as generally grown as Swedes and mangels, receive no small degree of attention and favor. They yield a large and valuable product, which is used for feeding milch cows and horses, hence the name "horse carrots."

Sugar beets are grown in limited quantity; they are worthy of more general cultivation, especially where dairying operations are carried on, there is but little difference in quantity of milk produced from feeding mangels or beets, but the butter made from the feeding of sugar beets has not only a firmer body but a finer flavor.

If we consider the food values between Swedes, mangels and turnips, we will find that the largest yielding crop does not alone determine their value, but that Swedes hold the highest rank for general feeding purposes.

To show this I will quote from the analysis of Professor Shuttleworth as given in Ontario agricultural report for 1893:

Swedes, result of average with five varieties; yield eighteen tons of roots per acre; roots averaged 1.98 pounds each; dry or food matter, 13.09 per cent, or 4,778 pounds per acre.

Mangels, average of four varieties; yield 18¾ tons; roots 2.13 lbs. each; dry matter 10.24 per cent, or 2,723 pounds per acre.

Turnips, average of three varieties; yield 14½ tons; roots 1.55 lbs. each; with S 14 per cent. or 2,238 pounds per acre of dry matter. It will thus be seen that while mangels gave three-quarters of a ton more roots per acre, the quantity of dry or digestible food is 1,055 pounds less than the Swedes, or about 2.85 per cent in favor of the latter, and turnips 4 95 per cent less food value than Swedes.

The same analysis also shows us that medium sized roots may produce less bulk but a greater quantity of food value per acre than large grown roots, and shall endeavor to show later on that it is less profitable to grow very large roots by greater space between the drills and in the rows than when grown medium in size and more thickly in the row.

To grow field roots successfully it is not only necessary to select proper soil, but it must be made rich and have thorough cultivation; no better fertilizer can be applied than well rotted manure from the stable; the ground should be prepared and manured in the fall. Fine stable manure may be applied in the spring, but it must be free from straw or coarse matter, otherwise the roots are liable to grow rough and prongy, making them more difficult to gather in the fall. The best soil for growing roots is clay loam; it is easily worked and admits of free growth to the roots, strong clay lands yield heavy crops if close attention to cultivation be given throughout the season. Sandy loam will produce good roots, but requires to be well enriched. In all cases deep cultivation is required.

The ground for the various root crops are similarly prepared, but as mangels, carrots, and sugar beets require to be sown as early as possible in spring, the same cultivation cannot be given after frost disappears as with later sown varieties, it should therefore be manured the previous fall, that only the necessary cultivation need be given in the spring; this consists of plowing, harrowing, and rolling, and repeated, if necessary, till all lumps disappear.

The ground being thus made ready it is thrown up in "ridges" or drills by the use of a double mouldboard plow. Carrots and mangels should invariably be sown upon such ridges that a good depth to the seed bed may be obtained, thus allowing deeper growth to the plants. The after care of the crop is easier, and should the season be wet the young plants are less seriously affected than when sown upon the level.

It is a debatable question whether ridge or flat cultivation is best for Swedes and turnips, but for the purposes of cultivation and protection against wet seasons, I would recommend sowing upon ridges or drills for all root crops, and which is the system adopted by our most successful growers.

What distance between the drills or rows will give the heaviest and most profitable crop? If I may be permitted will again refer to experiments made at Ontario Agricultural College in 1892 and 1893 with sowing rows 20, 26 and 32 inches apart.

These tests were made by sowing carrots, mangels and Swedes, each at the above named distances between the rows.

For comparison, and without giving unnecessary figures, it was found that the yield of crop was greatest per acre when sowing 20 inches apart, but the roots were largest, while yield was least, at 32 inches apart, it is therefore a loss in point of yield when sown at too great a distance between drills.

The thinning of plants in the row is more or less governed by the distance between the drills.

Greater distance, both between the drills and between the plants in the rows will undoubtedly give the largest roots, which are not only finer in appearance but more quickly handled when gathering and in feeding, but how will this increased distance affect the yield and value of the crop? The same experiment above referred to demonstrates that Swedes thinned to 20 inches apart produced bulbs averaging 2.44 pounds each, with only 11.64 per cent of food matter, or 3,259 pounds per acre, while those thinned to only eight inches apart give 6½ tons increased yield per acre, bulbs averaging 1.60 pounds each, with an increase of 1,720 pounds of food substance, as against the larger bulbs when grown at greater distance apart. Similar results are shown with carrots and mangels.

We must conclude from this evidence that to allow more than a reasonable distance either between the rows or when thinning that we sacrifice the value of the crop for the appearance of its product.

Drills when only 20 inches apart allow of insufficient distance for the convenience of cultivation. Without seriously reducing the value or yield would recommend that carrots be sown 22 inches between the rows, mangels, Swedes, turnips and sugar beets 24 inches, and plants thinned in the row as follows: Carrots, 3 to 4 inches, mangels, globe sorts, 9 to 10 inches, long varieties, 8 to 9 inches, Swedes, 8 or 9 inches, turnips, 9 inches, sugar beets, 8 inches apart.

Carrots, mangels and sugar beets require to be sown as early in spring as possible, according to favorableness of season, but not later than the end of April.

Swedes from 20th to 27th of June, if sown at an earlier date the quality of the bulb is apt to be inferior, as the hot weather of July and August is not favorable to their growth and tends to make them tough and fibrous. Turnips do best when sown from middle of July till begin-

ning of August, and may be sown even later in the season.

The quantity of seed sown per acre varies according to the liberality of the grower. From careful observation we find that he who uses a fair quantity of seed seldom fails in having a good crop of roots, the inference may be drawn that he who sows ample seed will be equally liberal with the manure as well as in their cultivation, all these requisites are essential for success.

The following quantities of seed are recommended per acre: Mangels and sugar beets, 5 pounds, carrots, 2 pounds, Swedes, 2 to 2½ pounds, turnips, 2½ pounds. These quantities are above the average usually sown. We are aware that heavy crops have been grown when using less than half these quantities, but the risk is too great, one year with another, when sowing seed too sparingly; it is greater economy to use ample seed and have a full stand of plants, than to have wide barren spaces, which is likely to occur with light seeding. Insects and other enemies frequently claim a share of the plants; they must be provided for.

The culture of plants for the food of domestic herbivorous animals, has always been confined to nations distinguished by advancement in the pursuits of agriculture, we find such branch of husbandry to have been successfully practiced by the Romans, and which has been continued, and yet serves as an index to determine the progressive advancement of agriculture up to the present time.

The American agriculturist has not seriously felt the need of special thought on these matters until within the past few years, but now that our fertile prairies and natural pasturage is fast coming under cultivation for other uses, the want of proper grasses to form permanent and luxuriant pasturage is a growing need.

Our experimental stations, both in the United States and Canada, have done much toward ascertaining the best grasses for our North American continent. Much has yet to be done. The seedsmen must take no small part in developing and advancing this branch of agriculture, and which will eventually result in the wider extension of the seed trade.

European seed houses supply annually enormous quantities of grass seeds, both for the Continental and American trade. The day is not far distant, however, when we shall become large exporters of varieties, many of which we may reasonably anticipate will be superior to those now obtainable; especially will this apply to varieties adapted for growing on this continent, as we already find that many of the best European grasses will not thrive in our varied climate, owing to extremes of summer heat and winter frosts.

In Canada alone no less than 300 varieties of grasses are found wild or naturalized, but varying largely in degrees of usefulness to the farmer, and while many of them produce but a meagre quantity of food and of poor quality when wild, will improve in yield and nutritive qualities when cultivated; the same conditions apply to varieties found in the United States, if therefore such of our suitable native grasses are selected and grown for commerce, we may expect great advantages and improvements in the formation of pasture lands in the near future.

Compare the pastures of England with those at home and what do we find, that the English pasture, which is formed by the use of many varieties of grasses and clovers, in mixture yields an almost endless quantity of food, rich in flesh-forming constituents, palatable and relished by all kinds of stock, while those of Canada and the United States, which are usually composed of clover and timothy, soon become almost barren of food, the reason for this is, that when only clover and timothy are sown there is nothing to follow their season of growth, and when once cut down remain apparently exhausted, but not so with grass mixtures. These, when composed of suitable varieties, come into growth at various stages of the season, and when eaten off, soon regain their vigor of growth and continue fresh and sweet throughout the season.

We are not so favorably situated in all sections of this country, nor have we the same favorable climate as England, it must not therefore be expected that we can obtain the same perfection in growth, generally, which we have in England, but lands can be found in every state and county that are exceptionally well adapted for pasturage, these should be laid down with mixtures of natural grasses.

Many of our progressive Canadian farmers are enjoying the luxury of such pastures, and are sustaining one cow per acre for an equivalent of seven months of the year, while the prevailing system of only clover and timothy will barely feed one cow per acre for three months.

It is a fact to be regretted that grass mixtures have not been more generally cultivated, in Canada much has been written upon the subject, and exertions put forth to induce their adoption, but with only partial success.

It is well known that the average agriculturist is slow in making departures in any system practiced by his forefathers, nor is he always ready to invest an extra dollar even when he can double his capital, until his neighbor first makes the experiment and proves it can be done; he may then be willing to make the investment, but through his constant desire to save a penny, is only agreeable to pay the price of a low grade mixture. Such ending is that he has not experienced expectations and falls back on his old practices.

The cost for laying down pastures with suitable grasses is somewhat more per acre than with clover and timothy, this, and the effect from using poor mixtures, has, to some extent, hindered their more general use, but where desirable and permanent varieties have been cultivated, they have been found profitable and most desirable.

There are numerous varieties of grasses which have been used when forming mixtures, but those found best adapted and most permanent in our climate, of the imported varieties are:

Meadow Foxtail, *Alopecurus pratensis;* Tall Oat Grass, *Avena elatior;* Meadow Fescue, *Festuca pratensis;* Tall Fescue, *Festuca elatior.*

We may add to these of our American and Canadian grown varieties:

Kentucky Blue, *Poa pratensis;* Canadian Blue, *Poa Compressa;* Red Top, *Agrostis vulgaris;* Orchard Grass, *Dactylis glomerata;* Timothy, *Phleum pratense.*

The Italian and perennial rye grasses *Lolinum Italicum* and *L. Perenne,* are largely used in mixtures, but are unsuitable for our winter climate; the Italian will not survive a winter's frost, the perennial rye may live through a mild winter but soon disappears; these should not be used when forming permanent mixtures, but for the purpose of a crop of grass or hay, the same season as sown, are very suitable.

It is no doubt a temptation, when making up mixtures to incorporate the rye grasses, as their low cost will yield better profit to the dealer, but the failure and disappointment to the purchaser, in realizing his object, should be considered, as also the ultimate success for the good of the trade.

Clovers should also enter into the composition of grass mixtures; the varieties most suitable are:

Alsike, *Trifolium hybridum;* White or Dutch, *Trifolium repens;* Trefoil, *Medicago lupulina;* Lucerne, *Medicago Sativa.* Red clover is usually included, but is not of such a permanent character as the other named clovers.

It is not possible or prudent to rely upon any specific formula when composing mixtures, the location and nature of the soil must be considered, as to the varieties required and proportions of each, the quantity of seed should not be stinted; the quantity of seed per acre should not be less than 28 pounds, including grasses and clovers, even this quantity can be increased with profit.

In selecting soils for permanent pastures it will be found that those which are unduly dry or excessively moist will not be suitable, or in other words, those which are very light or very heavy should not be selected. Clean tillage and thorough pulverization are important essentials. If the soil be not free from foul weeds, they will rapidly grow, increase, crowd out and materially injure the grasses. Thorough pulverization is necessary to facilitate the covering of the seeds evenly and uniformly, and to allow easy penetration of the rootlets of the young plants.

The seed should be sown in spring as soon as the land is dry enough for working; after the ground is prepared it should be first rolled, then sow the grasses separately, followed by sowing the clovers in opposite directions that an even distribution may be obtained, then harrow lightly and finish the operation by again rolling. Seeds thus sown will soon appear above ground and continue to grow rapidly.

Many advocate sowing about one bushel of barley per acre at time of sowing the grass seeds, should this be done, we would recommend the early cutting and curing of the barley, but would prefer sowing grass mixtures without other crop.

I have omitted naming several grasses which are usually found in seedsmen's lists; some of them are suitable for special purposes only, but for the purposes of this paper have endeavored to select only those which are found best suited to our Canadian climate. I might, however, mention *Bromus Inermis* or "Austrian Brome grass." This variety has recently been introduced in different parts of Canada, and from reports received it has been found admirably adapted for pasturage on lands of light or moist descriptions, and has thus far stood the frosts of Manitoba and the northwest, giving an early, heavy crop and producing a good aftermath of succulent leafy shoots.

Should this grass continue to give the same good results as for the past three years it will be an acquisition to our northwest lands where grasses, such as we can grow in the east, will not permanently thrive. We would not recommend its use for eastern cultivation, unless for the purpose of remaining in pasture for several years, because it is not so easily eradicated from the soil as those with less underground root-stocks.

When buying or selling grass seeds too much care cannot be exercised in observing that they are true to name. Those who deal in grasses are aware of the difficulty experienced in obtaining European varie-

ties that are free from adulteration, for not only does such adulteration reduce the value of the variety to the purchaser, but often foul weeds are introduced, much to the injury of the pasture sown. It is only by supplying pure seeds and those adapted for the purpose intended, that the general use and ultimate building up of the grass seed trade can be attained.

Duties

Below is the present status of several articles of interest to the trade, under the proposed Wilson bill.

Onions and beans, 20 cents a bushel; peas dried, 20 cents a bushel; split peas, 50 cents a bushel of 60 pounds; peas in cartons, papers or other small packages, 1 cent a pound. Plants, trees, shrubs and vines of all kinds, commonly known as nursery stock, not specially provided for, 10 per cent. ad valorem.

Potatoes, 15 cents a bushel of 60 pounds; castor beans, or seeds, 25 cents a bushel of 50 pounds.

Garden seeds, agricultural seeds and other seeds not specially provided for, 10 per cent ad valorem. Vegetables in their natural state, not specially provided for, 10 per cent. ad valorem.

Orchids, lily of the valley, azaleas, palms and other plants used for forcing under glass for cut flowers or decorative purposes, 10 per cent. ad valorem.

A FUNNY SUIT is in progress in this city. Datlip Bottger, it is alleged, bought of a Northwestern Seedsman a supposed package of Cauliflower seeds. The seeds were planted but the product was Turnips. Therefore suit is entered for $600 damages for loss of time, wear and tear of the soil, and the difference between the market value of the Turnips and the estimated value of the desired Cauliflower. The portentious fact is discovered that three ounces cauliflower, costing a little over $1, is relied upon to bring, in the market, after having gone through the necessary process of development, the sum of $600, which most capitalists might consider a good investment for one season. And yet Donnelly says the farmer is oppressed. Later:—Judgment was rendered in favor of the Seedsman for cost of seeds sold.—*Stack's Adv Bulletin, St. Paul.*

Near Long Island Ferry, NEW YORK.
JUST IN, NEW CROP OF
Primula chin., Cineraria hybr.
We are now ready to book orders for
ROMAN HYACINTHS, LILIUM HARRISII, LILY OF THE VALLEY, ETC.
Write for prices, it will save you money.

NOW READY.
3000 COLEUS, in fine condition, mostly Verschaffeltii, Golden Bedder and some fancy varieties, 2½ and 3-inch pots, $2 50 per 100.
VERBENAS in bloom, very fine and healthy, 3-inch pots, $2 50 per 100.
100,000 CABBAGE Plants, $1.50 per 1000; $1 50; the finest strain in the market; every plant will make a head if planted from now to Aug. 15. Cash with order.
WM. J. CHINNICK, Trenton, N. J

OUR BARGAIN LIST. Per 100
English Ivy, 2-inch pots, 3 to 4 feet high $2 00
Coleus, our regular 25 assortment 1 50
Polyanthus, 3-in. pots, our regular 25 plants 2 00
Geraniums, assorted, to save carrying over. 2 00
Alternantheras, to close at once 1 00
Roses, special offer, Bride, La France, Mermet 2 00
Verbenas, nice assortment of colors, 2-inch 1 00
Fuchsias, extra nice, in bloom 2 00
The "Hard Times" Cash Collections of Palms (5 & 6-in. for $1 and 4 for $2; Latania, Kentias, etc.) are moving, but we can supply all who send at once. Mention AMERICAN FLORIST and receive large Tricolor Geranium, or 3 English Ivy, free.
WILLIAMS & SONS CO., Batavia, Ill., Manufacturers of BATAVIA LABELS.

TO BUYERS OF
LILIUM HARRISII.
There will be sold this year in the United States a large quantity of Lilium Harrisii from which the flowers were cut in Bermuda the past season for Easter trade. Such bulbs will prove very unsatisfactory for forcing.
We have secured from one of the largest and best growers in Bermuda his entire crop of Lilium Harrisii, from which no flowers were cut. It has been personally inspected by us during cultivation, and is of the purest strain and absolutely free from any taint of disease, an exception in these respects to many bulbs offered. Our bulbs are grown on new ground at a great distance and entirely separated by water from the infected district, with the result that not the slightest vestige of disease has appeared among them.
Bulbs will be delivered full measurement and at prices as low as reliable goods can be offered. Florists wishing to secure this quality of bulbs should write us for prices, stating quantity required.
It is a well-known fact that large quantities of low grade Dutch and French bulbs are annually unloaded upon the American market. We have made it a special point this season to secure bulbs only of the highest grade and shall depend upon our ability to supply you with this quality of goods at reasonable prices for your continued favors.
We have not secured all the best bulbs that are grown, but all that we have are of that kind.

CHEAP CUT FLOWERS

may be had from bulbs in winter and spring. We now offer bulbs at prices that you can buy and pay for them. When in bloom they will be a great help to you to offer cheap flowers to the public. They occupy very little room in your greenhouses, can be forced very quick, nearly three times as quick as other stuff, and produce flowers of very gay colors at a time when other stuff is rather pale and dull. Bulbs in bloom can be sold at a price in the reach of every one.

References as to the quality of our bulbs we can give you to nearly all the leading Bulb Importers in the United States.

Ask for our 1894 Catalogue.

Pittsburg.

Thomas Lister died at the Mercy Hospital June 21 of typhoid fever. The deceased was born in Aberdown, Fifeshire, Scotland, and came to this country about 10 years ago. He was formerly head gardener to Winthrop Sargent at Fishkill-on-the-Hudson and James Kirk, the well known soap manufacturer, at Hartland, Wis.; later identified with Supt. A. W. Bennett of the Bureau of Parks, Pittsburg. He was buried at Homewood Cemetery by Pittsburg Lodge 484, F. & A. M. Floral tributes were sent by the Pittsburg Florists' Club and the employes of Phipps Conservatories, Schenley Park. He was a young man of many excellent qualities and was highly respected by all who knew him. He was about 30 years of age.

Mr. James S. Taplin was in town last week from the west on his way back to New York, and reports business fair.

B. L. Elliott of Elliott & Ulam will be married on Thursday next, 28th, and expects to spend the honeymoon east, visiting Philadelphia, New York and Boston.

Trade in general has been very quiet; many of the stores have had quite a number of weddings. B. A. Elliott Co. have been quite busy the past week with out of town funeral work.

The parks are rushing the bedding, and when finished there will be some designs of great merit, both in Allegheny and Pittsburg, on which I will comment later.

The market is very quiet. The warm weather for the last two weeks has about ended the run on all bedding plants, which I must say have not been first class by any means. Flowers plentiful; carnations $1 per hundred, roses from $2.50 to $6 per hundred. A. J. E.

Galt, Ont.

Trade has been very fair, notwithstanding wet and cold. Quite a few new private establishments have been built lately, and now two new commercial ones, namely, A. Oliver and Walker & Co. The former is a hustler. Andy will get there all right; he is to heat with hot water. D. McGeorge has decided to change to hot water also.

Our September show promises to be of unusual interest this year owing to a new feature introduced. John Wells, A. Common and D. McGeorge each offered 18 pot plants to children aged from 10 to 15 years in the first week in June on condition that they grow them and bring them to the show, the society to offer prizes for them, and then they become their own property. Of course the secretary was besieged with applicants; instead of 18, as far as I can learn, it reached 70. R.

Prices Lower Than Ever.

Ready for shipment from July to September.

Calla Aethiopica, fine dry roots in all sizes.
Lil. Longiflorum, ready for shipment from October 1st to March 15, 1895.

Pansy ★ Seed.

The JENNINGS STRAIN of high grade Pansy Seed. New crop now ready. Saved with special care from only the very finest varieties and (warranted) first-class in every respect.

THE JENNINGS XX STRAIN.

The cream of Pansies. Grand colors mixed, pkt., 1500 seed, $1.00; 1 oz. $8.00.

The Jennings Strain, finest mixed, pkt. $1.00 about 2500 seed; 1 oz. $6.00; 3 ozs. $15.00. No skim milk in this strain. (They are just as good as I can make 'em). To my old patrons I would say they are a big improvement over last season—more variety and finer colors. The best strain for florists either for winter bloom or spring sales; all large flowering.

Black Dr. Faust, finest	pkt., 2500 seed,	$1.00
Finest Yellow, black eye	" "	1.00
Pure White, the best	" "	1.00
Victoria, bright red	pkt., 1000 seed,	1.00

DWARF FRENCH CANNAS

We offer an immense stock of strong, well established plants from 4-inch pots, which will make a display at once. All have been well hardened off in open frames, and must not be confounded with dormant eyes or freshly divided plants out of benches.

We list here only the principal varieties, of which we have a large supply. For a general list refer to our Spring Trade List, which describes over seventy-five varieties including all the desirable novelties of the season.

St. Paul, Minn.

Trade has fallen off quite materially, still there has been no great surplus at any time. The best teas, Kaiserin, Testout and La France, retail readily at $1 per dozen. The poorer grades go at 75 cents. Carnations are still quite abuudant and of good quality. Among the reds Portia seems to be the favorite. Carnations retail at 25 cents per dozen. Sweet peas have not made their appearance to any great extent.

In roses Bridesmaid will be planted the most extensively of any of the new varieties. There seems to be a hesitancy on the part of our growers to plant Kaiserin extensively for winter blooming. Though never thoroughly tested by any here, they all seem to think it of doubtful value for winter blooming As a summer rose it is showing itself a leader, and each day brings fresh proof of its great merits.

Carnations that have been planted out are rather backward, owing to the extreme heat and drought of the past few weeks. Now that cooler weather and refreshing rains have come we expect to see an improvement all along the line. Violets and sweet peas have withstood the drought well, as have asters, phlox, etc.

The store of the Warrendale Greenhouses has been discontinued. Dull times and poor sales for some time past have induced its closing.

Inquiry of the principal growers about town elicits the fact that the spring trade in plants and cut flowers has been nearly if not quite up to the average. While prices ruled somewhat lower, the aggregate in sales will foot up to the average. The quality of both plants and cut flowers has been better than heretofore and the quantity larger. FELIX.

If you use straps you want to spare your PATIENCE, TO SAVE YOUR TIME, and to prolong the life of your STRAP. I'm a grower; / had to. Hence this buckle fixture. The WORKEASY TRADE MARK.

FLORISTS WIRE DESIGNS

MANUFACTURED BY

N. STEFFENS

335 EAST 21ST ST. NEW YORK.

The "Seventeen-year Locust."

Replying to T. M. and others, the following circular, issued by the U. S. Dep't. of Agriculture under date of May 1, gives the desired information.

The fact that the Periodical Cicada, or so-called "17-year Locust," is to appear in two great broods the present season is stated by a number of newspapers to have been announced by the U. S. Department of Agriculture, and these statements have caused some unnecessary alarm among those who do not understand the exact nature of the insect or who confound it with true locusts or so-called "grasshoppers," owing to the somewhat careless newspaper wording. The Department has made no such public announcement the present year, although the Cicada chronology published by Professor Riley in Bulletin No. 8 of the Division of Entomology in 1886 predicted an extended appearance of the insects in 1894.

The Entomologist of the Department has been interviewed on the subject and states that the damage done by these insects is, as a rule, quite immaterial, consisting in the slight cutting, breaking, and deadening of the terminal twigs of fruit and shade trees by the females in the act of laying their eggs. The injury becomes serious only when the insects are exceptionally abundant and oviposit in young nursery stock.

According to Professor Riley's chronology given in his first report on the Insects of Missouri (1868), two broods are due in 1894, and the insects will make their appearance during the last week in May. Brood XII is composed of the 17-year form (*Sep endecim*), and its last appearance was in 1877. It then occurred in the immediate vicinity of New York, Brooklyn, and Jersey City, and on both sides of the Hudson River as far north as Troy, in portions of Connecticut, New Jersey, Pennsylvania, Virginia, and the District of Columbia. Seventeen years previous to 1877 the insect was recorded in North Carolina, in Dearborn County, Indiana, and in Kalamazoo County, Michigan. The last three localities, however, were not substantiated by reports received in 1877. In all the localities above mentioned, Cicadas may be expected during June of the present year. Brood XVIII is of the thirteen-year race (*tredecim*), and as with other 13-year broods its range is in the more Southern States, rather than in the Northern part of the country. Its last appearance was in 1881, when it occurred in southern Illinois, throughout Missouri, with the exception of the northwestern corner, in Louisiana, Arkansas, Indian Territory, Kentucky, Tennessee, Mississippi, Alabama, Georgia, and North and South Carolina.

The larvæ, which live underground and feed to some extent upon the roots of plants, gradually rise to the surface of the ground when nearing full growth, and from about May 20 to June 1 they begin to make their appearance above ground in the nymph or pupa condition. They crawl up the trunks of trees, cast their skins, and the winged insect comes forth. The adults are prevalent for five or six weeks, and, as above stated, do some little damage to trees and shrubbery by puncturing them for the purpose of egg-laying. The eggs hatch in about two weeks and the young larvæ drop to the ground, which they enter to begin their long subterranean life.

The Entomologist of the U. S. Department of Agriculture will be glad to receive during the present season any accurate locality notes of the appearance of these insects, as he has been for many years engaged in mapping the exact distribution of each brood as it appears.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

TO TAKE PLACE OF WIND MILLS

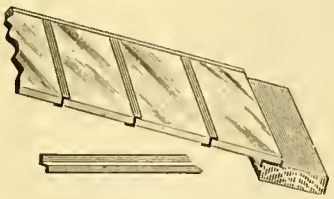
HOT AIR PUMPING ENGINES

A Windmill

Is unreliable because it depends upon the elements for its power; hydraulic rams also depend upon favorable conditions and waste as much water as they secure. Steam pumps require skill and hand pumps demand labor and time. The

DE LAMATER-RIDER CR DE LAMATER-ERICSSON Hot-Air Pumping Engines

are especially designed for pumping water, and from shallow streams or any kind of well. They are simple, safe and reliable, require no steam and have no valves. They require very little heat to operate them, and can be arranged for any kind of fuel.



Send for illustrated catalogue to

THE DE LAMATER IRON WORKS,

87 South Fifth Av.,

NEW YORK, N. Y.

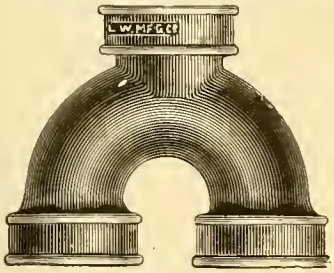
IMPROVED GLAZING.

GASSER'S PATENT ZINC JOINTS for putting glass makes greenhouses air and water tight; also prevents sliding and breakage from frost. Does not cost as much to heat a house glazed with the joints, thereby saving enough in fuel to more than pay the additional cost of glazing. The leading florists of the country are using them. Write for circulars with full particulars and price list.

J. M. GASSER, FLORIST,

Euclid Avenue, CLEVELAND, O.

THE CHAMPION Automatic Ventilator.



The cheapest, easiest to operate, and by far the best machine in the market. Don't buy a Ventilator until you have seen my illustrated descriptive circular, which will be sent you free, giving prices, etc. Also **Champion Soil Pulverizer and Sifter.**

Wholesale Flower Trade in New York and Boston.

Few who have not come into direct contact with New York's flower market have any adequate conception of its extent and importance. For fine roses and other forced blooms in the winter season, quality and variety being considered, it is unquestionably the greatest cut flower center in the world. This has all come about within a quarter of a century and there are no special indications that it has yet reached or will soon reach the zenith of its growth.

On account of the peculiar and varying conditions under which much of the business is conducted and the very general disinclination of individuals to supply statistics regarding their own trade, it is not possible to furnish anything more than approximate figures regarding the gross value at wholesale of the annual output of flowers which are marketed through the different channels existing in New York City; but with the data in hand, carefully compiled from various trustworthy sources, a conservative and fairly accurate estimate places the amount of the wholesale cut-flower trade of the past year at $1,200,000. Of this, more than $800,000, or fully two-thirds of the entire amount, including the choicer grades of flowers and nearly all the roses, passes through the hands of the dozen and a half commission houses, large and small. The commission men have practically no opposition outside of their own ranks, and the value of the stock sold by contract or by peddling to the retail stores or shipping direct to out-of-town buyers from the greenhouse is comparatively small, probably considerably under $50,000.

The market near 34th street ferry does not seriously conflict with the business of the commission dealers, for the trade here is all done at a very early hour in the day. The stock consists largely, in the summer months especially, of the coarser varieties and quite a percentage of the buyers are of a class which cut but a small figure in the following of the commission men. This market is the great outlet for Long Island growers mainly, and has increased rapidly from a very humble beginning to an enormous enterprise. There are about one hundred and fifty stock holders and thirty outsiders who lease stands. The aggregate annual sales here cannot be ascertained with any degree of accuracy but the amount is variously estimated by those in a position to judge, all the way from $300,000 to $400,000.

The past season has not witnessed the growth in receipts for flowers which has been characteristic of each successive year heretofore. This could not be expected, considering the depression in every other direction. That there has been no apparent falling off should be a good cause for congratulation. Prevailing prices in several important lines, notably chrysanthemums, violets and Easter lilies, and to a lesser degree in roses, have been lower than in previous years, but the quantity marketed, averaging probably from twenty to twenty-five per cent. more than last year, has so increased the gross receipts that the total money realized is believed to be fully up to the record. In short, financial results have been as large as in the preceding year but more stock has had to be handled to do it. Carnations have proved an exception to the prevailing rule and are credited with a considerable advance in value from the previous season. In bulbous stock there has been a decided falling off, tulips suffering most. The business of shipping cut flowers to a distance has been on the decline for some years and dealers are being forced to depend more and more on the local market for their trade. In the estimates given above no account has been taken of the trade of Brooklyn, which is quite an item of itself. Many Long Island growers find an outlet for their goods in Brooklyn and do not figure in New York trade.

The wholesale trade of Boston while quite large is not and never has been controlled to any great extent by the commission men. Many of the conditions prevailing here are peculiar and do not exist in any of the other large markets. The section of the city in which a prosperous retail flower business may be conducted is limited to a very small area. Within this district the growers coming from out of town on the various railroads in the morning find it easy to make the circuit of all the buyers, and this fact together with the opportunities thus enjoyed for meeting each other daily and gossiping over their business has always been a powerful factor in perpetuating the old custom of peddling from store to store and making the efforts of the commission men to get control of the stock and systematize the business fruitless to a great extent.

A careful estimate of the volume of the peddling business places its value for the past year at $185,000. The commission dealers do about $160,000 of cut flower trade, but they also handle supplies of all descriptions which makes quite an addition to their business. The Growers' Co-operative Association, which has been established for over two years, is composed of growers who formerly carried their goods from store to store but now come together in a market every morning on a plan similar to that conducted at 34th street ferry in New York. About $145,000 is the estimated value of the flowers sold here in the past year. This amount does not represent the entire cut of all the growers leasing stands here, for quite a number of them carry a part of their stock direct to the stores. The retail dealers in Boston have got into the habit of having the flowers brought to their

door for inspection and selection and they do not take kindly to any method which makes it necessary for them to go out and seek for their stock. Most of the prominent retail dealers are growers as well, and sell a considerable quantity of cut bloom grown at their own establishments, certainly $25,000 is not a high figure for this item.

It appears therefore, that the value of Boston's wholesale cut flower trade is more than $500,000 annually. It is not likely that it has increased any during the past year. Prices on roses have averaged lower than ever before but there has been probably a sufficient increase in amount of stock marketed to fully compensate for the shrinkage resulting from lower prices. The shipping trade here has, as in New York, been gradually forced to narrow down its borders until now it is confined mainly to New England points and is as such, almost entirely in the hands of the commission men, who act as a sort of exchange for these out of town parties supplying them with goods they require and receiving in return consignments of such goods as they may have in surplus stock.

Hardy Flowers for Midsummer.

After the roses are past and gone, the prevailing tone in gardens is a monotone of green or gray. The florists' flowers and annuals give a little relief here and there, but after all the surface of the country is barely signal-lit by the beacons of floriculture. In shrubs particularly the scarcity seems almost painful, I will therefore give a pretty full list of such as occur in my notes, as flowering over a wide range of country—mostly at the north. There may be some synonymy among specific names, and the florist will do well to look it up in the new edition of Johnson's Dictionary or in Nicholson.

TREES AND SHRUBS.

Actinidia polygama (Cl.),
Abelia rupestris (S.),
Æsculus parviflora varieties Æ. macrostachya,

Thermopsis Carolinensis,
Viola cornuta varieties,
Veronica spicata, V. incana,
Yucca filamentosa,
Verbascums,
Aquatics: Nymphæas, Nelumbiums; Orchids: Platanthera species, etc.

This list might be still further lengthened, but a proper regard for your space has admonished me to suppress very many species and varieties. There is enough however, to show that the summer garden need never be sombre.

JAMES MACPHERSON.

Trenton, N. J.

DO YOU WANT a list of trade organizations, both national and local, with names and addresses of principal officers, time and place of meetings and other information? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

THE BEACH AT ATLANTIC CITY, N. J., WHERE THE CONVENTION OF THE SOCIETY OF AMERICAN FLORISTS IS TO BE HELD, AUGUST 21 TO 24.

Sweet Peas at their Best and for Everybody.

Flowers do not, like diamonds, get their value from their rarity. The more beautiful they are the more they are intended to be universally enjoyed. The highest mission of a flower is to have some skilled hand develop it at its best, and then some other benefactor put it, in its most perfect form, within everybody's reach. Everybody has heard about the improved sweet pea, but the day is just dawning when everybody can have the sweet pea at its best.

My trip to California was not to see how a hundred acres of sweet peas would look in a great blanket of bloom, but to see whether the varieties which Mr. Eckford is producing by the packet could there without deterioration be produced by the pound or hundredweight. It was of no concern to me where or how the old common and inferior sorts were grown, for they will hold their own under ordinary conditions. But Mr. Eckford's best work is now being put up in very small parcels. And the first year's trial of them in this country hardly gives more than a suggestion of what they are. And the demand has increased so slowly that, outside of the seed growers, it has been a question whether the fancy prices paid and the meagre results realized made them worth the trouble to any but a few specialists. Success with them has been too small to give them headway in this country, and there was danger of the public tiring of hearing about their beauty when so few of them were to be seen. The trouble was not merely with the introduction price of them, but there was the great uncertainty of their germinating and amounting to anything until acclimated here. It has required some trumpeting of their excellence to make even a few invest in them. And even now Mr. Eckford, in his last letter, tells me his friends have advised him to advance his introduction price from six cents per seed to five shillings. If he does our seed growers will be the only ones who will pay the price, and they would need but a few seeds each to start their stock with, for after the first year they increase rapidly. In that case Mr. Eckford would be like the young artist whose wife told him that if he would not charge but a quarter as much for his pictures he would sell twice as many. With this very limited English supply it has been a matter of great interest to turn to California and see what they could do. I feel a very warm place in my heart for Mr. Eckford and his splendid work, and if I could incidentally help him to find a way to make money faster, as a reward for his patient and skillful work, I should be glad to do so. But I feel a great deal more interest in our American flower lovers; and, as Mr. Eckford probably already suspects, I would do all I could to put his latest and best novelties into our growers' hands, for I certainly want them as expeditiously as possible to make our great flower public happy. His dear old Scotch blood is a little too slow for us. And now that our California growers are finding that they must plant as early as October, Mr. Eckford cannot please them better than to send his stock right along as soon as he harvests it. Indeed, since he has his splendid reputation all made, and what he wants is probably material reward, I state here, what I have suggested to him, and what I am now, since my California trip, more convinced of than ever, that the place for him to get his novelties grown so as to supply the trade and remunerate himself is in California. It has proven by winter freezing and harvest rains to be a hazardous crop in England, and every year seems to bring a shortage of some sort. The advantage in favor of California would be seen in everything, soil and climate there being reliable factors and there being no question now about honest, skillful work, and in two years any of his novelties could be grown to supply all demand. Such a variety as the Emily Henderson illustrates how quickly a large stock can be put on the market at a price that in the aggregate would bury the fancy priced sealed Eckford packets out of sight, and yet be within popular reach.

Now I suspect that even some seedsmen and florists will say this talk about improved sweet peas is "Much ado about nothing." Why, an improved pansy means a blossom three inches long, and an improved chrysanthemum means a huge advance in size. The finest expanded Eckford sweet pea is not so very large, but the increase goes into more than one blossom on a stem as well as into size. Even double the size of the blossom, and at the same time double the number of blossoms on a stem, and it rivals the pansy. But I will admit that there is some ground for skepticism and disappointment in regard to improved sweet peas. As I suggested in my last article, this flower is such an exclusive inbreeder that unless the tendency to rapid reversion is met by the most careful selection of seed stock and the highest culture in one quarter the time it took Mr.

Eckford to develop it it will run back.

What is the sweet pea at its best? Begin with any one of the old varieties. You have a limp kind of a flower with a heart shaped standard about 1⅛ inches in width, the general texture of the blossom being such that a midday sun shrivels it, giving it a lank look. In a high grade Eckford you have a standard expanded into nearly circular shape, about 1⅜ inches in diameter, with a wavy fullness that gives it a still more generous look, and a substance that defies the noonday sun. The wings too correspond with the standard. No amount of development will make a coarse flower of the sweet pea. Its very fragrance indicates grace and refinement. To offset any gross tendency it puts its increase into more blossoms on a stem, and the aggregate makes a great advance in size. But it is not in palpable substance alone that the Eckfords excel, but in the delicate and beautiful character given in the colors and tints of the finest sorts. Among the bunches which I showed to-day at the Springfield rose show I could see people attracted by the new soft bluish tint of a bunch of Emily Eckford, which seems prettier this year than last.

About seventeen of the Eckfords, so far as introduced in this country, have the largest expanded form. Of course this size and form require as skillful treatment and as rich ground to bring them to their best as pansies do. Even with seed that has the greatest possibilities in it every florist knows and every amateur will find out that sweet peas, like every other high grade flower, do not push forward into the best competitive merit except under those conditions of culture which win prizes for other flowers. Even if we get the very best seed from California it still remains for good work to be done to show how good it is.

What guarantee have we of first class seed from California? Let me describe the conditions under which the largest grower is producing this seed, for I am confident he is setting the pace for the others. A foundation has been laid in a long experience at vegetable seed growing. The large houses need no introduction to these growers, for, with their immense acreage of seed almost wholly contracted for before harvested from year to year, the reliability of their general work is to be presumed. But then in onions and cabbages and lettuce enthusiasm does not rise much above a commercial temperature, while I found about the same enthusiasm in growing the seed of this flower by the five, ten, thirty and hundred acres that I feel over my thousand feet of double rows. I found that kind of young blood at work that not only is alive for commercial success, but alert and ambitious for the finer points that must decide the merits of such a flower. The grower himself should be a flower "crank," and his foreman must be of that finer fibre that reads the texture and tint of a blossom at a glance, and I was glad to travel over those blooming acres with just such workmen. I found their trial grounds planted with stock direct from Eckford. Then the natural conditions. One must see that heavy black soil that lies four feet deep in the Santa Clara valley to understand how during the rainless season such crops can be grown. It will bake like an adobe brick, yet worked at the right stage it is soft and friable, and is heavily cropped year after year without manure or any fertilizer. It even shows the presence of alkali. Usually the rainy season closes by the first of May. With an average rainfall before that time the crop goes through till harvest, making fine, plump seed, and not only do they harvest without rains, but their seed is dried in the continuous sunshine, and much of it never sees a warehouse till it crosses the Rocky mountains and is stored in some eastern seed house.

The coolness of the California nights in summer following their mild winter is extremely favorable for sweet peas, giving them a slower growth and a long season. Experience is teaching them to plant about October, so that the vines will be ready to bloom when the rains stop, and probably this will give a better matured and stronger seed than if planted later. At least all the root growth should be made by the time the dry season comes.

They plant just about as corn is planted. The rows are three to four feet apart, and two seeds are dropped about every eighteen inches. This makes a stocky growth, covering the ground, and as there are no winds or storms to beat them down they stand from three to five feet high, supporting each other. Of course no extra support can be given to such an acreage of vines. Before and at harvesting a great deal of seed is lost, or would be but for the practice of letting a "volunteer" crop come the next year from self sown seed. This is well enough for one year's succession, but the higher grade sorts can only be held up by the most careful selection of seed stock each year.

"Rogueing" is a very important matter, and the grower I refer to has "rogued" his crop three times this season. This consists of going through every acre and pulling up every vine that is not true to name. I saw this done so thoroughly that it did not seem as if a "rogue" remained, but it is a fact that a percentage of the best seed will revert. I sincerely hope every amateur will report to his seedsman just how his seed comes into flower, that he may both aid the grower and hold him down to strict thoroughness. I do not believe Mr. Eckford himself can give us truer seed stock than we can get from California of the largest, finest sorts if all the growers follow out the line of work I saw in my visit.

Of course this branch of seed growing could easily and wretchedly be overdone by multiplying acres and doing ignorant work on them, and it would be fatal to the present popular "fad" in this flower. But just as there is always "room at the top," so will that grower reap a permanent success who keeps pace with the latest improvement in sweet pens and holds each variety before him as a work of art, and makes a science of seed growing. The California growers will be glad to have the list of varieties weeded out, for the California sun at midday burns every blossom which does not have good substance, only the standard being affected, and marring the beauty of the fields in bloom.

I must say a word again in closing by way of protection for the sincere effort which our growers will make to improve their seed stock and hold it up in quality. Our seedsmen have got to economize at some point, and they are watching closely the grower's figures to see how much can be saved at that end. And here is a seed they are handling by the hundredweight and ton. Fifty or a hundred dollars saved on a ton of sweet pea seed is a tempting item. But every worthy patron of the flower trade would, if he had been behind the scenes, as I have, say "Let that fifty or one hundred dollars be a premium in the grower's favor to put into extra 'rogueing' and careful selection of seed stock." At that point where seedsmen compete with each other on gaudy catalogues they are lavish in their outlay. But the grower knows how they will figure if they hear of an increase in the acreage of sweet peas, and how they will estimate the probable yield per acre. I believe the only partiality I feel in the matter is that of one amateur among many, who wants the best seed, and expects to depend largely on California for such seed as will give the finest exhibition flowers. If the seedsmen want to scale the prices down to the lowest commercial bottom on the old varieties, or the twenty or so ordinary sorts, they may dicker all they please, for those varieties are as easily grown as mustard seed. But the day of sweet pea exhibitions has come. The relative position of this flower among other first class flowers will now turn on twenty or more of the finest sorts, and such novelties of merit as are yet to be introduced. My greatest anxiety at this time is that this, being a seed of bulky weight and a field grown crop, the down scaling of wholesale prices will make the grower feel he is working for commerce instead of an appreciative floral public who are watching his work with great interest. I have perfect confidence in the work which I saw done by the growers, and I plead with them to maintain graded prices, such as would foster the most careful work on their part. I think they fully understand that Primrose will not pass for Mrs. Eckford, nor any halfway reverted stock for the splendid types which Mr. Eckford has given us.

W. T. HUTCHINS.

Plant Shipments.

The suggestion of a correspondent in the FLORIST of April 12 that purchasers of plants should pay in advance, i. e. that the money should accompany the order, brings up another view of the case which I do not think has received the attention it deserves, and that is the condition in which plants should reach the purchaser. From my own experience and observation it does not seem to me that sufficient oversight is given to the packing department; that the packers, while they may intend to always perform the work faithfully, get careless and the result is vexation and loss to the customer. When a box of plants comes by express and upon being opened the earth about the roots is found so dry it literally falls away, leaving the roots exposed; and when ferns in particular are in the order and they never recover from a drying, though they do not always show it at first, the buyer is not particularly happy if he has sent the money with the order; he must nurse the plants along as best he may and instead of being able to fill his orders promptly, he must try again, or keep his customers waiting. The writer sent to an old house issuing a gaudy catalogue for some plants not obtainable elsewhere and sent the money, never having dealt there previously. The package, when it came, was not even marked plants, and the earth was absolutely dust dry. It was weeks before the plants could be gotten into a growing condition. This is no solitary case. When one pays $1.50 for a 6-inch pot of Adiantum Farleyense and $2 for a fine specimen of Gleichenia dicarpa and $1.50 for the same of Gymmogramme Japonica, and because the packer failed to thoroughly wet the plants, see them gradually die away one frond after another as well as most all the balance of the order, he cannot help feeling that sui-

THE BOARD WALK ALONG THE BEACH AT ATLANTIC CITY, N. J., WHERE THE CONVENTION IS TO BE HELD, AUGUST 21 TO 24.

ficient attention is not paid to wetting plants before they leave the packers hands. One does not like to make claim for damage, though sometimes compelled to do so, but that better satisfaction might be given with a more careful oversight is indisputable. During winter months or when express cars are heated very hot from the locomotive unless plants are thoroughly wet the moisture evaporates in the hot car and the recipient is doomed to disappointment. It may be desirable to put large advertisements in the magazines and to expatiate upon how customers are pleased, but the best advertising is that obtained free of cost where a customer is satisfied, and the most detrimental if he is not.

The dry paper so often wrapped about the ball of earth helps extract the moisture unless thoroughly wet, and the house which does not give careful attention to that detail loses in the end, and those who do it will gain new customers steadily. The cost of wetting the plants thoroughly before packing is nothing, their condition upon arrival is in a very great measure dependent upon its being done, and when a buyer gets dry plants once or twice he is pretty likely to send future orders elsewhere. F. C. CURTIS.

The Park System of the City of Cleveland.

The City of Cleveland has during the past year made great progress in park extension. A commission has been appointed, composed of Chas. H. Bulkley, Pres't., Amos Townsend, John H. Parkhurst, Robt. Blee and Chas. A. Davidson, with F. C. Bangs, Sec'y, C. D. Klock, Sup't, and C. W. Pratt, Jr., Chief Engineer.

The commissioners now control about 635 acres, of which Gordon Park, the gift of the late W. J. Gordon, contains 180 acres. This park fronts on Lake Erie, and is a beautiful diversified piece of ground. It contains much natural beauty, fine native timber, which has been well cared for. Trimming out has not been neglected and as a consequence the trees have retained symmetrical proportions and there are many good specimens of their types, including beech, linden, elm, ash, oak, etc. In the border plantations native undergrowth is luxuriant, while in the center a noble meadow opens out to the view, round which many combinations of effective groupings of trees and shrubbery can be observed. The park as it stands to-day proclaims the donor a man of taste and of public spirit.

The Doan brook gulch between Gordon and Wade parks has been purchased by the commission and contains about 180 acres; the distance is 3½ miles. The character of the ground is picturesque, being a ravine averaging about 500 feet in width, a brook meandering through the bottom, and in many parts covered with fine timber, much of which fortunately has been in the hands of protectors of natural beauty, and has thus escaped the hands of the desecrator. It is proposed to construct through this ravine a parkway connecting the two parks. The work will be of an expensive character, as a number of bridges will be required for creek crossings, and all filled streets crossing the gulch will be tunnelled.

Wade Park contains about 75 acres and is a beautiful undulating piece of ground, rich in natural woods, mostly clothed in natural undergrowth, and the drives and walks are picturesque.

The commissioners are now negotiating for property on the Doan brook gulch extending from Wade Park south-easterly 5½ miles to Shaker heights for an extension of the parkway in that direction. They have also purchased 80 acres in Brooklyn and 100 acres on the west side bordering Lake Erie to be called Perkins Park. This is finely situated and is characterized by a beautiful ravine, and a fine Lake bluff well clothed with native trees and shrubbery.

A boulevard through Brooklyn, Newburg and Warrenville is also part of their plan for a magnificent system of parks and boulevards which when completed will give Cleveland precedence over cities less fortunately situated in point of soil, natural growths and topographical advantages.

The commissioners have $1,000,000 from the sale of bonds, $700,000 of which has been set aside for land purchase, leaving $300,000 for improvement, a modest sum for a scheme of such importance. The yearly levy will only provide for maintenance. They do not despair, however, but that their city will furnish the thews and sinews when needed for such a work.

J. A. PETTIGREW.

Park System for Essex Co., N. J.

Essex County, New Jersey, is to have an extensive park system. Under a law recently passed a board of five commissioners has been appointed as follows: Cyrus Peck and Stephen J. Meeker, of Newark; Edward W. Jackson, of Belleville; Frederick W. Kelsey, of Orange, and George W. Bramhall, of South Orange.

The commissioners are to serve two years, without compensation, and "shall

consider the advisability of laying out ample open spaces for the use of the public in such county, and shall have authority to make maps and plans of such spaces and to collect such other information in relation thereto as the said board may deem expedient, and shall, as soon as conveniently may be within the term aforesaid, make a report in writing of a comprehensive plan for laying out, acquiring and maintaining such open spaces." They may spend $10,000.

Mr. Fred. W. Kelsey, of Orange, was the originator of the movement that has resulted in the above action, and as he is now one of the commissioners and is much interested in the project he will undoubtedly see that the work is pushed to fruition.

Coming Exhibitions.

TORONTO, ONT., July 18-19. Annual flower show Toronto Electoral District Society. J. P. Edwards, Sec'y, 17 Washington Ave.

BOSTON, Sept. 5-6. Annual exhibition of plants and flowers Mass. Hort. Society.

CHICAGO, Nov. 3-9. Chrysanthemum show Hort. Society of Chicago. W. C. Egan, Sec'y, 620 Dearborn Ave.

NEWPORT, R. I., Nov. 6-8. Chrysanthemum show Newport Hort. Society. Alex MacLellan, Sec'y, Ruggles Ave.

BOSTON, Nov. 6-9. Chrysanthemum show Mass. Hort. Society. Robt Manning, Sec'y, Horticultural Hall.

PITTSFIELD, MASS., Nov. 6-9. Chrysanthemum show Berkshire County Gardeners' and Florists' Club. W. M. Edwards, Sec'y. 103 Howard St. Pittsfield.

ST. LOUIS, MO., Nov. 6-9. Chrysanthemum show St. Louis Florists' Club. E. Schray, Sec'y. 4101 Pennsylvania Ave.

INDIANAPOLIS, IND., Nov. 6-10. Chrysanthemum show Society of Indiana Florists. W. G. Bertermann, Sec'y, 37 Massachusetts Ave.

PHILADELPHIA, PA., Nov. 6-10. Chrysanthemum show Pennsylvania Hort. Society. D. D. L. Farson, Sec'y, Horticultural Hall, Broad St.

DENVER, COLO., Nov. 7-10. Chrysanthemum show Denver Florists Club. Adam Kolbanke, Sec'y, L.B. 375, So. Denver, Colo.

PROVIDENCE, R. I., Nov. 8-10. Chrysanthemum show Rhode Island Hort. Society. C. W. Smith, Sec'y, 61 Westminster St.

HAMILTON, ONT., Nov. ——. Chrysanthemum show Hamilton Agric. Society. Walter H. Bruce, Sec'y.

Chrysanthemum Notes.

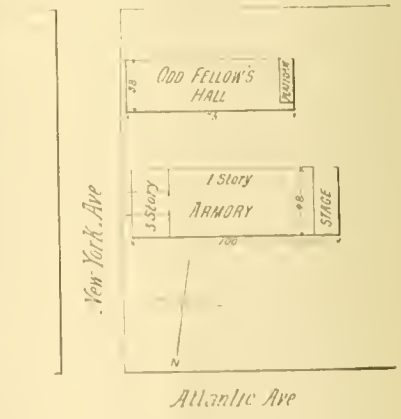
The last ten days have been exceedingly hot in this vicinity, and very trying for plants that have just been set out, especially those that were taken from flats and their roots broken up. A good syringing once or twice a day will be found to be very beneficial, it will not only help along the plants that have not yet got hold, but will prevent all from wilting. When you syringe during such hot weather give the walks and woodwork a good wetting, for the evaporation will be productive of a good growing atmosphere.

The watering must now be done with great care and judgment and any places that may be too wet must be avoided until they dry out a little. And another thing unless the hose is in the hands of a very careful man the soil will be washed over toward the back side of the bench or into the walks. In our wanderings during the past winter we chanced to see at one of the places that we visited just the thing to aid one in preventing this. It consisted of a small piece of tin or sheet iron nailed to a stick about two feet long, the tin being curved into nearly the shape of a scoop shovel. The end of the hose was then fastened to the stick just far enough away from the tin so that when the water was turned on, the stream would strike in the center of the tin and run over the edges. This will reduce the force of the water when it strikes the bench and will to a great extent prevent the washing of the soil. In making this little implement it is far better to turn over the edges of the tin or iron, so that if you happen to strike the plants in running it through the rows it will not cut them off or injure them. The length of the stick will depend a great deal upon the width of the benches, but don't make it so long that it will be unwieldy or hard to turn in the walk.

There is a matter that must be thoroughly talked over at the meeting of the Chrysanthemum Society of America this summer, and that is the judging of the blooms and plants at the various shows. Upon the proper judging of the displays depends the success and the quality of the exhibits at the show to be held the succeeding year, for if they are poorly judged or judged upon a wrong standard the growers will go home dissatisfied, and are to a certain extent in the dark as to what constitutes a good bloom or plant, and will if in their opinion the practice of wrong judging continues, soon become discouraged. This matter is causing considerable discussion on the other side of the water, but they have, as yet, made but little headway. Every fall we hear more or less fault found with the judges at the different shows, but we have thought for some time that the fault laid more in the system, or really lack of system, in judging, than in the judges themselves. Every judge should have a scale whereby he can score every exhibit if he thinks it necessary, and then in case of close competition he can tell the defeated exhibitor by how many points he was beaten, and the judge that does this will have a good solid rock whereupon he can stand. This is now done, we are well aware by many of the prominent judges, but at present every one is working on his own scale or standard. Now, it seems to us that the growers and exhibitors of good blooms and plants ought to know as well as anybody what that standard should be, so let the matter be well thought over, and let every grower that is interested make it a point to attend that meeting, and help the society establish a standard that will be adopted throughout the country. There is no way, of course, whereby the societies can be made to adopt any standard, whatever it may be, but we have no doubt that if the Chrysanthemum Society of America adopts a scale of points all the societies and clubs holding exhibitions will announce in their schedule that the premiums will be awarded on that standard. So come, every one that can, and help draw up a scale as near right as it can be made.

ELIJAH A. WOOD.

West Newton, Mass.



The Exhibition at Atlantic City.

Up to date of writing (June 28) the entries for the convention exhibition aggregate about 80 per cent. of the available space. There are quite a few prospective exhibitors who will probably have their applications in by the time this appears in print and there will consequently be very little space left. Those who have not yet sent in their applications should therefore lose no time in doing so.

The exhibits are varied in character and promise to make a most attractive display. Among the more prominent entries already filed may be mentioned the following:

Pitcher & Manda, plants and bulbs.
Henry A. Dreer, plants, bulbs, etc.
J. E. Jeffords & Co., fancy pottery.
Whilldin & Co., flower pots.
Daniel B. Long, photographs.
Powell Fert. & Chemical Co., insecticides.
W. Albert Manda, plants, etc.
Robert Craig, plants.
Charles D. Ball, plants.
Edward A. Seidewitz, plants.
Ellwanger & Barry, cut roses, phlox, etc.
J. H. McFarland Co., catalognes.
Pittsburg Clay Manufacturing Co., flower pots.
A. Blanc & Co., cacti and fancy pottery.
H. Bayersdorfer & Co., florists supplies.
A. Q. Wolf & Bros., ventilator and soil sifter.
Z. De Forest Ely & Co., bulbs and florists' supplies.
Frank L. Moore, shipping trays.
Hose Connection Co., Kinney pump.
Hitchings & Co., boilers and general exhibit.
Ben Chase, Jr., pot label and plant sticks.
E. Hippard, ventilator.
A. Hermann, florists' supplies.
James Wotherspoon, watering pots and fumigators.
Rose Manufacturing Co., sulpho-tobacco soap.
Henry F. Michell, bulbs and sundries.
Parmenter Manufacturing Co., flower pots.
Edward S. Schmidt, water lily blooms.

The exhibition will be held in the Morris Guards Armory on New York avenue, a very convenient location, being next door to the Odd Fellows' Hall where the meetings of the society are to be held. The armory is well lighted and convenient

in every way. Down the center of the hall it is proposed to run a large table 8 feet wide to be used mainly for plants. On each side of this a table 4 feet wide running the entire length for bulbs and miscellaneous. Alongside the walls on each side of the hall a table 4 feet wide running the entire lengths for florists' supplies and other exhibits of a similar character. On the stage and in front of the stage boilers and such exhibits may be appropriately and effectively displayed, while at the entrance end it is proposed to leave the floor and wall space to the right and left of entrance clear of benches for the display of ventilators, stakes, labels and other sundries not requiring tables for their proper display.

SCENES AT ATLANTIC CITY, N. J., WHERE THE COVENTION OF THE SOCIETY OF AMERICAN FLORISTS IS TO BE HELD, AUGUST 21 TO 24.

The exhibitors are making strong efforts to make this exhibition instructive and interesting to every one in the trade. All the latest novelties in plants and bulbs, baskets and other supplies, ventilators, boilers, flower pots, etc., will be shown and a walk through the exhibits will well repay any one. In fact no one can afford to miss making a thorough examination of everything on exhibition. It may mean many dollars saved in the future to have the information about these various matters stowed away for use when wanted. And if anything among the exhibit strikes you as something you want don't forget that the exhibitors require some encouragement for the time, trouble and expense of showing these things for your good. They naturally want to do business with you, and it will be doubly gratifying if you should see your way clear to give them an order on the spot. Many of the exhibitors will have spent weeks to make an up-to-date attractive display and it will be very disappointing to them if no good business comes from it. This exhibition is got up by the S. A. F. for the good of all concerned—buyers as well as sellers—and it is to be hoped all will be well pleased with the results. One thing seems certain, that the attendance will be better than ever before, not only because of the nearness of the Exhibition Hall to the meetings of the society, but also because this convention will have more florists attending it. Atlantic City in August, with its refreshing sea breezes, sea bathing, and general gaiety, will draw the crowd from the four corners as nothing else could have done.

For my last paragraph special emphasis. And on this point: Let nobody forget that it is business before pleasure. Don't go on the board walk and fool round first, last, and all the time. The convention is not held primarily for the purpose of letting the members enjoy themselves. The main object is the advancement of the business. We must have progression. If we stand still first thing we'll be going backwards. And while the essays, discussions, and general business of the society are very important yet it must not be forgotten that the exhibition will teach a practical lesson in progress—an illustrated panorama of progress we might say, teaching its lesson in the easiest, simplest, and most effective way possible—and no one should miss it on any account whatever. There will be plenty of time for enjoyment after the business end has been properly attended to.

Entry blanks may be obtained of the undersigned. Address 1025 Arch street, Philadelphia. Those intending to exhibit should lose no time in putting in their applications.

G. C. WATSON,
Supt. of Exhibition.

Philadelphia, June 28, 1894.

Chicago to Atlantic City.

The Chicago Florist Club has secured a special low rate to the S. A. F. convention at Atlantic City, over the Pennsylvania railroad. Train leaves Chicago at 3 p. m. Sunday, August 19, passing over the Allegheny Mountains in daylight and reaching Atlantic City Monday evening. Florists in the west and northwest who wish to join the party are cordially invited to do so. Berths may be reserved and further information obtained by addressing the chairman of the Chicago Club's committee, Mr. G. L. Grant, 322 Dearborn street, Chicago.

Beaufortia Splendens.

This is among the best of the bottle-brush plants, as these Australian shrubs are commonly called, and so beautiful is it, in common with several others of the same class as to make one long for the return of these plants to popular favor. All the beautiful hard-wooded greenhouse plants are now under a cloud but I hope the time is not far distant when we shall see them more generally grown.

The neat habit of this Beaufortia and the fact that it will flower freely in a small state are points in its favor, but still it is by no means the only desirable member of this class, as mention may be made of metrosideros, melaleucas and callistemons, one of the best of the last being C. rigidus, a large growing kind that requires a large house or conservatory for its full development, and when this can be afforded it the large clusters of flowing crimson-colored stamens make a goodly show and remain in beauty by a succession often kept up for months.

A light open soil seems to suit them. They can also be raised easily from seeds or cuttings, but the latter is preferable, as in common with most other plants those raised from cuttings flower more freely in a young state than seedlings.

A. J. E.

Carnation Notes.

Carnations do not require very much attention at the present time, so I took a week off and went with the B. P. O. Elks to Atlantic City, and I can't resist the temptation to tell all carnation growers to do the same in August. Atlantic City is not in the carnation belt, but that is all the better. It is a place where you can lie on the sand and watch the ocean and forget the time of day, the day of the week and the date of the month.

The attractions at Atlantic City are so varied that all, no matter what their tastes may be, can put in a pleasant week, making the convention a combination of pleasure and business and rest, and go home refreshed, ready for the opening of the season. The hall where we meet is one of the finest, and away from all noise and commotion, so that we can hear the papers that are read and discuss them without annoyance. The exhibition hall is but two doors from the meeting hall, and I am sure there are none among us so perfect but that we would be benefited by rubbing elbows with the men we shall meet in those two buildings.

In the interval between sessions one can retire to the board walk (and there is no place in the world like that board walk to study humanity) and be fanned by the cooling breezes from old ocean. The bathing is superb, and nothing in the world will make you forget all about carnation rust, red spider and all other petty worries incident to carnation growing so quickly as to get into a bathing suit and battle with the breakers for an hour or two.

If one tires of the bathing there are fine yachts that can be had to take a sail out to the sea for ten or twelve miles, and you come back rested and ready for the session, bright as a dollar, providing you do not get seasick. There is some good sport to be had fishing on these yachts, and you can go home with true fish stories that you will have a hard time making your friends believe.

We Elks fell so deeply in love with the city that we shall meet there again next season. The S. A. F. being a nomadic association, may not meet there again for a long time, and my advice to all my fellow carnation growers is to attend this meeting. The committee on entertainment is arranging a very nice program, and as we are assured of an equally nice intellectual program it is a good chance to kill two birds with one stone.

ALBERT M. HERR.

Carnation Mrs. Fisher.

Since my article on carnation Mrs. Fisher appeared, I have received a number of letters asking me whether I had plants for sale. I would state here that I have not. If I had it would be announced in the advertising pages of the FLORIST. One correspondent says that he grows Mrs. Fisher, but that red spider got the best of them last winter and he could not therefore use the cuttings. Now it seems to me that this doctrine of not watering carnations overhead is breeding mischief. I syringe mine quite copiously at least once a week, and never saw any bad results. On the contrary the plants seem to enjoy it. If there are any open blooms I always cut them before syringing, for water rots them, and that is the only bad result of watering carnations overhead. If I am not ready to pick the flowers and the plants need watering, I remove the nozzle from the hose and let the water run between, when it is quite easy to avoid the open blossoms. Water will not adhere to the foliage of a healthy carnation anyhow, so I cannot see where any possible harm can be done. However I see great harm done by not syringing, and this harm is red spider.

This reminds me of another doctrine now exploded, but still believed in by the majority of amateurs, namely: Don't water any plant while the sun shines on them. This may be true with some plants such as Rex begonias, gloxinias and others, but those require shade at all times. I came across an amateur (?) lady florist once who had some plants standing on the sidewalk waiting for customers to take them away. The plants were all badly wilting, for the want of water. I asked her why she did not water them? "But how can I?" was her reply. "The sun is shining on them." "My dear madam," I said, "do you not see that you are already killing your plants by not watering them, what more harm can you do them?" Taking a watering pot, which stood near, I soaked them for her while she wondered: "Well I declare, I have always been told I must not water plants while the sun beams on them." The doctrine of not syringing carnations is a parallel. We are told not to do it, but I do not remember that I have ever been told what harm there is in it, aside from the one I have mentioned. I may be a little dense but I have often wondered that if it hurts a carnation to syringe it, why do the little slips stand it so well in the cutting bench? CHARLES EVERDING.

Planting Under Glass.

Now is the time for planting roses, etc., under glass. There are several different ways of doing this. Some drive nails at the end of the benches at the regulation distances apart, when a line is stretched from one end of the table to the other, and the planting is done to this line. Others use what is known as a marker, making a mark each way of the bed, and the plants are set at the intersections. A plan which has been in operation here for some time past, and which seems to be the most practical, and at the same time as simple as any, is to get a piece of lumber an inch or so square, as long as the width of the bed or table to be planted. Nail a piece, six inches or so long, securely across the end, making it what might be termed a T square. We usually measure off the distance asunder we wish the rows to be, along the front of the table with a lead pencil. We then get the necessary number of plants that we think will occupy the first row, and arrange them to suit our ideas, then make a pencil mark that can readily be seen where each plant strikes the T square. This will give a better idea than when stated in inches as to how far apart we wish the plants to grow. After we are satisfied about these important matters the rest is simple enough. We just lay our T square across the table, always being sure to have the stick on the same side the mark indicating where the rows or lines are to go, and wherever the pencil marks are, there goes a plant, and so on until the house is completed. Although the plants may not be *perfectly* straight, under this plan of operation, yet they will be sufficiently so for all practical purposes. Where our table is crooked, of course, our T square arrangement will follow the bend of the table. This, however, is of minor importance when we take into consideration the advantages that this plan possesses over all others which have been tried here.

Some would prefer to "spot" where the plants are to set, by the removal of a small quantity of soil, and have the plants removed from the pots before they are taken to the house to be planted; but I prefer to place them in position in the pots, as in this way there is less handling and consequently less danger of the drying of the roots or damage by mutilation. To facilitate arranging for planting it is always better to place the plants toward those already in position, as in this way it obviates the necessity of raising the T square over the plants every time it is moved for the next row. When field grown carnations are planted in their winter quarters in the fall, the spotting process would then be the best plan to adopt.

If I have not made myself sufficiently understood, I shall be pleased to further explain where I have not made myself clear. E. L.

Wood Ashes on Benches and Tarred Paper in Greenhouses.

The question is referred to me through the "Editor's chair," "Are wood ashes hurtful to plants on benches under potted plants if laid on the bench ½ an inch thick with a little sand sprinkled over them?" The answer is, there is nothing deleterious about wood ashes at all. They will do no harm to the plants in pots that are stood on them. But why use them? They bake up badly and make a poor medium for the purpose. Lake sand, river sand or bank sand is much to be preferred for the purpose, and if you are so peculiarly situated that you can procure neither of the above, then sifted ashes from the furnace pit are much better than the wood ashes.

The latter question is as worded, "Last fall when I built my house 16x50 I used tar paper and I found it very bad for the plants. Would it be good to take it out or would it not be so hurtful to plants the second year?" The inquirer does not say how he used the tarred paper—whether he used it between the boards of the wall of his house, or whether he lined the wall inside to keep the boards from rotting with the syringing and consequent dampness which must be an accompaniment of a greenhouse. Coal tar, which is the tar of what is known as tarred paper, is a most dangerous thing to use and is extremely hurtful to both plant and animal life. Compound of sulphur and hydrogen, which is tar, has its uses, but not where animal or vegetable life is expected to flourish. I can however assure the inquirer that in the second year much less hurtful effects will be found from it and in time, say three or four years, the effects of the tar will have entirely evaporated.

While on this subject I might as well say that I have seen one amateur and one

professional greenhouse man accept pipes, and have them put into their houses in this city, covered with a coating of tar. Poor creatures, they suffered far more than any sympathy of ours will ever compensate. The pipes were supplied by a local plumber, who, properly enough, had them tarred, but the idea of their being put into a greenhouse is too ridiculous.

I have advocated and practiced for the past 3 years, putting a small piece of tarred paper under lily and other pots when stood on old rose or carnation beds, and I say here it is a most excellent thing to do. The piece of tarred paper under the pot will seldom or never come in contact with the sun's rays, being cut to suit the size of the pot, and is entirely different from plastering up the side of house with it or putting it on the pipes.

WM. SCOTT.

Boston.

The first of the regular weekly shows at Horticultural Hall was held on Saturday, June 30, and was highly successful. There are still some very fine roses left, as was seen by the superb exhibits of M. H. Walsh, Hugh Williamson and James Comley, gardeners to J. S. Fay, Wood's Holl, W. W. Astor, Newport and F. B. Hayes, Lexington, respectively. J. Eaton, Jr., W. H. Spooner and others also staged quantities of roses, the larger display however being, as in the regular rose show, that from Wood's Holl. All the favorite old sorts and many of the newer ones were shown, and the quality of the blooms was of the best. The roses filled the long center table and overflowed on to the side tables, which were heavily loaded with extensive collections of hardy herbaceous bloom, native flowers, Kæmpferi and English irises, delphiniums, candidum lilies, foxgloves and campanulas, for all of which regular premiums were offered.

The larkspurs were especially good, the collections rich in variety and the spikes wonderfully large and perfect, particularly in those shown by N. T. Kidder, J. L. Gardner and J. S. Fay, which were awarded first, second and third prizes.

The displays of hardy perennials from N. T. Kidder, Shady Hill Nursery Co., and Rea Bros. were grand and the attention given them by the throngs of visitors was good proof of the rapidly increasing popularity of these useful plants. The potentillas, anthemis, lychnis, coreopsis, campanulas, pentstemons, œnotheras, etc., were all shown in good variety. Candidum lilies were abundant, also sweet williams, poppies and foxgloves. C. M. Atkinson, as usual, got all the first prizes on Iris Kæmpferi, which were shown by him in best form. James Comley had some good varieties of Cattleya Mossiæ in his miscellaneous collection.

At the Arnold Arboretum, Rosa anemonæfl ra looks exceedingly pretty now. Rosa Wichuraiana is just coming into bloom, nearly all the other sorts excepting R. setigera and Caroliniana being about gone; these late blooming species will last well into July, and are especially valuable on that account. A very attractive shrub is Ceanothus hybridus, recently received from Lemoine. The color is pale lilac rose, the flowers much larger and the spikes denser than in our white native species.

Rhododendron (Azalea) arborescens has been very fine this year. It is easily one of the most beautiful garden shrubs. Its magnificent clusters of large white flowers with crimson stamens and surrounded by rich foliage give it a beauty scarcely equalled by the best Ghent varieties.

Large masses of Asclepias tuberosa are being planted in the grounds. These vary greatly in color, coming in all shades of orange and orange scarlet, and make a great show. Mr. Dawson says he has never known Amelanchier Canadensis to bear fruit so heavily as it has done this year.

The cut flower trade has come to an abrupt close. The big city order for bouquets for the public school graduates was divided up as usual among quite a number of the florists, and with this final flare-up the season ends. There is not a big crop of roses coming in, in fact choice buds are scarce, but carnations are heaped up everywhere and any price, even as low as $1 per thousand, is accepted for them.

One of the most pleasing tributes to the memory of the late Louis Guerineau was the remark of Mr. Robt. Craig of Philadelphia, in referring to Mr. Guerineau's work at the World's Fair. "If everybody attended to his duty as that little man did there would be a very different story to tell about horticulture at the Fair."

The Newton Horticultural Society, cooperating with the citizens, are persisting in their crusade against the tent caterpiller with great success. The whole number of belts of eggs collected and destroyed this season was 57,050.

New York.

The great overstock existing a week ago has been relieved to some extent by the diminished production. Roses are plentiful enough, but those that are obtainable are of poor quality generally. That the end of the heavy glut had come began to be evident on Wednesday, when the wholesale men were gratified to have an occasional messenger from the retail stores in quest of stock. As these callers were in some cases those who had not made their appearance before for weeks it was plain that the scarcity was becoming general, and dealers were obliged to look beyond their usual sources of supply.

The new establishment of W. A. Manda at South Orange is getting rapidly into shape, the change made in its appearance during the past two months being almost incredible. There is a fine collection of hardy herbaceous, evergreen and deciduous stock in the beds outside, and in the greenhouses, which are already filling up rapidly, the display of choice specimens is very attractive.

The committee on revision of the by-laws of the Florists' Club, consisting of Messrs. Weathered, Allen and Young, met at Alderman Morris' office on Wednesday and had a long session, in which many important changes were adopted with a view to facilitate and systematize the Club's work, and these will be presented before the club for action at the next meeting on July 9. A large attendance is hoped for.

Thos. W. Weathered's Sons have on exhibition at their office handsome nickel plated models of their hot water heaters, which are beautifully done, and attract much attention. Mr. Charlie Weathered, when not at his office, puts in all his time at his suburban home, where the delights of boating, gardening and chicken farming are indulged in to his heart's content.

Mr. B. L. Elliott of Pittsburg is in town. He comes in another capacity from any of his former visits. The young lady in the case seems to enjoy the occasion as much as Ben does. Their friends all extend congratulations.

Mr. G. Herrmann reports a big sale of tobacco dust for greenhouse use this season. It is preferable to tobacco stems for many purposes.

The Cut Flower Exchange has recently paid a dividend of 10%.

Philadelphia.

George Magg of 21st street and Columbia avenue died Saturday, the 23d, after a few minutes illness. In answer to a call to come down to breakfast he arose and in walking across the floor was stricken down and died in about twenty minutes. The physician pronounced his disease to be fatty degeneration of the heart. Deceased was about 30 years of age and was apparently strong and healthy. We are informed his widow will continue the business.

An occasional funeral order or something for the seashore is about all there is in sight nowadays; the transient business has almost entirely disappeared, and the growers are gradually dropping out one by one. In a short time only those who make a specialty of the summer trade will be seen.

The hot weather has told on the roses, which are now very poor and quite disappointing to the few customers who are willing to pay for good ones. Becker is sending in a few fair La France, the first from his summer house; he also has some nice Marie Guillots. Sweet peas are very abundant, as are also carnations. "Sam" Pennock gets carnations by the wagon load, and Joe Groben, the boss fakir, buys them from him in five and ten thousand lots, using a furniture car to convey them away, and sometimes making two or three trips a day. They are sold on 8th street at from one to two dozen for 5 cents. Hollyhocks in all colors are now peddled about, bringing 50 cents to $1 per hundred flowers. Summer camellias they are called by some and white ones are largely used by the "crape pullers" in their funeral work.

Elwood Brinning has taken the establishment formerly run by the Tioga Floral Co. at Tioga and will conduct a general greenhouse business, growing cut flowers and bedding plants in their seasons.

A committee consisting of Messrs. Lonsdale, Burton, Craig and Kift visited Atlantic City a few days ago to perfect arrangements for the meeting in August. They found the large hotels unwilling to make concessions. In one or two instances, however, they were given encouragement. It is hoped also to have a list of large cottages, which are preferred by many to hotels.

There must have been a great overstock of bedding plants this season, or else the demand has not been as large as formerly. Seashore florists report having received samples of first-class stock, geraniums, coleus, alternantheras and the like out of pots, offered at from $1 to $2 per hundred. The stock was first-class in every respect, and it didn't come from Buffalo either.

Many growers say their carnations are dying in the field; the prolonged wet spell, followed by the extreme hot weather, caused the plants that were in low ground to damp off; from 20 to 30 per cent loss is reported.

Saturday night generally finds a lot of the boys at the club room; if any committees have work to do they will be pretty sure to attend a meeting on that night. The bowling enthusiasts and the pool sharps are also on hand, and a merry time generally is the result. It is astonishing the amount of latent bowling tal-

ent there is lying about. J. W. Colflesh gave an exhibition of what he could do in a game with Brown last Saturday night, and it was hard work for the champion to come out ahead, even with a large score. Messrs. C. Ball, Watson, W. Craig and plebeian John Smith are getting to be great pool players and will soon be able to give such post graduates as Anderson, Brown, Longinette, Crawford and others points; why don't the committee hurry up that tournament?

Chicago.

The general tying up of all the railroads centering here has interfered seriously with the shipping trade. Fortunately the amount of business done in this line at this season of the year is very light, consequently the losses sustained are not very heavy. Express companies refuse shipments over some roads absolutely and on all others only accept freight at shippers' risk. On shipments from local points up to July 2 there was little trouble, as the majority of the growers located north and west are on the North-Western Road, which up to that time had not been affected. To-day (July 3) however this road too is tied up, which is liable to shut off a good part of the supply.

Trade, however, is so extremely dull, that it takes but a very small supply to fill all demands, and if the majority of the stuff, by courtesy called roses, is shut out entirely it will be so much the better for the market.

It is useless to quote figures, as there are no settled prices for anything. The question now-a-days is not how much do I want, but how much am I offered.

Our local wholesale men have formed a Protective Association. This move had been contemplated for some time. A few days ago an organization was effected with Flint Kennicott, president, and George Klehm, secretary. The constitution and by-laws have not been given out for publication but the avowed purpose of the association is that of mutual protection in dealings with irresponsible parties in the trade. Other objects, if any, are for the present kept secret.

Worcester, Mass.

On account of the early season and the forwardness of the hybrids the rose show, which was originally scheduled for June 28, was advanced to June 21, in conjunction with the regular exhibition of that date. The way the public turned out for this show demonstrated very forcibly that the Queen of Flowers has not yet lost her hold. The hall was crowded from three o'clock to five with her enthusiastic admirers.

A pleasing feature of the exhibition was the very creditable displays made by the amateurs, who work under many disadvantages and are usually cramped for room to grow a sufficient variety to enter. But the amateurs were "right in it", to use a slang phrase, and did much to make the show the success it was.

There were a large number of entries in the cut flower class and they were nearly all deserving of first premiums; of the four prizes awarded, F. A. Blake secured first and Mrs. E. C. Burke second.

The call for the best display of Campanula Medium brought out but two competitors, but the good points in their displays made up for lack of quantity; A. A. Copeland was awarded first and Mrs. Henry Phelps second. Mrs. Thomas Ward received a first premium for a splendid stand of Dianthus barbatus and T. E. Fisher second. The pæonies made a beautiful display, the pink and white varieties being especially noteworthy; there were a great many entries, among these were O. B. Hadwen and T. H. Record who secured first and second respectively.

The roses were of course the center of attraction and made a magnificent display, especially the twelves and sixes. They were arranged on long tables in the center of the hall and were shown in long vases. All the exhibits were made up of good specimens of standard varieties, the foliage being unusually bright and clean. H. F. A. Lange and Edward Hale won first and second premiums in the order named for the best twelves, sixes and best stand. H. F. A. Lange also captured first for best basket with H. A. Ives second and F. A. Blake third. The display of moss roses was only fair, and gratuities were awarded to the following exhibitors: H. A. Ives, Mrs. Thomas Ward, Fred. A. Blake and Mrs. T. H. Record. Arba Pierce showed a nice display of Orchis fimbriata.

The market is packed jam full of A No. 1 flowers. Roses and carnations are coming in by the bushel and other stuff in proportion. We are getting rid of some of it and that is saying considerable. Wedding decorations are unusually scarce, in fact even the weddings have not been very numerous.

We are suffering very much from drought, and all outside stuff is showing very slow growth. SEEDLING.

St. Louis.

Several good rains during the past week have broken the protracted drouth and as a result vegetation has put on a brighter appearance. Carnations have derived great advantage from it, as they were commencing to feel the effects of the lack of moisture. All plants intended for stock have been improved likewise, it has within the past few years come to be recognized that it is unsafe to plant any stock out that is intended for future use, and trust to the rains to carry it through the season; so that the majority of the florists are prepared to water all stock planted out, and those that are not so fortunately fixed at present are making improvements in that line.

A good story is going the rounds in connection with the recent dry spell and water supply that will touch the hearts of a majority of the florists so it is given. It appears that one of the craft living in the northern part of the city was obtaining his water supply from the city mains, the amount used being measured by a meter; now it occurred to the meter during the height of the dry spell to break. The department upon finding that the meter had broken, calmly proceeded to put in a new one, and incidentally to charge the user twenty-five dollars for same, as is usual; the claim being in such cases that it is private property when put on your place. During the three or four days it took to get the new meter in working order, a straight connection was make to the mains, so as not to shut off the necessary water supply needed in the houses Now while some water had been used on the grounds when the meter was working it was discovered as soon as a straight connection had been made that the ground was exceedingly dry, and would stand watering day and night, which was accordingly given it; and by the time the new meter was in working condition quite a large piece of ground had been thoroughly irrigated.

A meeting was called by the picnic committee of all interested in the affair, and it was decided to hold a picnic at Meremec Highlands on the 25th of July, and a committee consisting of A. Y. Ellison, C. Young, Jules Benecke and Chas. Kunz appointed to formulate a program that would make the affair as enjoyable as possible for participants. A subscription list was started to defray the expenses of the premiums to be offered, which met with hearty support. The committee also reported that the most convenient method and arrangement for getting to the grounds had been found to be the use of the regular trains; the engaging of a special car as proposed necessitated leaving the grounds too early in the evening. The committee appointed to arrange a program have decided to have a list of athletic events, and a bowling match in the afternoon, and dancing in the evening.

The committee charged with making arrangements for attending the S. A. F. have seen the various roads and have found them, or rather their representatives, more stiff necked than usual. Without doubt, however, satisfactory terms will be made with the B. & O. people, as our treatment by them on the trip to Washington is favorably remembered. If possible arrangements will be made to join Indianapolis and Cincinnati on the way, so that pleasant company will be assured.

Mrs. M. D. Eggeling, whose business is located at Grand and Lafayette avenues, is erecting a palm house 60x24 feet, and also a carnation house 100x16 feet. We had the pleasure of going through the houses recently, and formed a well selected and well grown assortment of palms, pandanus and other decorative stock, as well as the usual collection of greenhouse and bedding stock, and all in the best of condition. R. F. T.

News Notes.

BLOOMINGTON, ILL.—W. F. Hempsted is building a house 24x50.

CUBA, N. Y.—Oldham Bros. have retired from the florist business.

EVANSVILLE, IND.—J. D. Carmody is adding a palm house 25x66.

WATERVILLE, N. Y.—Geo. Marshall will add 300 feet more glass this fall.

STILLWATER, MINN.—Wehring & Kuehn are building three houses 16x75.

DETROIT, MICH.—Geo. A. Rachham is building a new house 102 feet long.

ASHLAND, O.—A. C. Lampreeht is building a three-quarter span house 18x80.

KIRKWOOD, MO.—F. W. Ude, Jr. is building two new houses, each 20x100.

DUBUQUE, IA.—W. A. Harkett will soon build a short-span-to-the-south house 20x50.

PARK RIDGE, ILL.—C. Ehrhardt is building a house (short-span-to-the-south) 20x90.

PAINESVILLE, O.—The Storrs & Harrison Co. are building a range of new houses.

WALTHAM, MASS.—Wm. Silman & Son are building a three-quarter span house 13½x65.

CHATHAM, N. Y.—R. E. Shuphelt is connecting to his other houses a three-quarter span house 15x50.

JAMESTOWN, N. Y.—A. L. Thrall has opened a store at corner of Main and Third streets.

PANA, ILL.—Ticket agent Bradford, of the B. & O. R. R. will soon build a new greenhouse 20x150, to cost $1,000.

LAKE GENEVA, WIS.—Mr. Silas Button has withdrawn from the firm of Button Bros. & Co. and the business will be continued under the firm name of Frank Button & Co.

JANESVILLE, WIS.—Walter Helms has rented his greenhouses to Mr. Fred. Rentscher, of St. Louis, who will continue the florist business. Mr. Helms will still continue his seed business.

DENVER, COLO.—C. B. Wright is arranging to enter the business and is building a range of houses. The State Board of Agriculture has authorized the construction of a new horticultural hall at the Agricultural College.

SALT LAKE CITY, UTAH.—Mr. C. F. Pfau, has now moved on to his own property at the corner of Kensington avenue and Glen street where he will soon build three commercial greenhouses, each 20x120. The new buildings will be first-class in every respect.

HAMILTON, O.—Henry Haeffler is building three connecting span houses 20x100. Theo. Bock is adding a show house 15x72, two-thirds span, with row of side ventilators on one side and stationary glass on the other. John Lodder & Sons will soon begin building two connecting three-quarter span houses (short-span-to-the-south) each 108 feet long. One house will be 20 feet wide and the other 14 feet wide.

LOUISVILLE, KY.—The spring trade is about over in plants, and school commencements are also past. The trade has been very good considering the cold, wet spring and the hard times combined. Mr. Marrett, the successor of Rompen & Marrett, is building three new houses about 150 x20. He is fixing up his place in grand style. E. G. Reimers is remodeling three large houses for roses and carnations.

SEATTLE, WASH.—Mr. H H. Hindshaw, Curator and Landscape Architect of the Arboretum at the State University, has a gang of men at work clearing up the dead timber and stumps and getting the ground in shape for the projected arboretum. Many of the stumps are from 5 to 6 feet in diameter and it takes a charge of about 20 pounds of blasting powder to blow them into pieces that can be handled by one team. Work on the building has also been commenced.

HOLYOKE, MASS.—The Holyoke Horticultural Society held a rose show on June 14 and 15 at the Unitarian Church. It was the most successful show ever given by the society, there being about sixty exhibitors and over one thousand visitors. Prominent among the exhibitors were C. L. Burr, E. H. Howland, C. W. Ranlet, Dr. E. A. Reed and E. C. Taft. Several of the school children showed large and interesting collections of wild flowers. There is some talk of holding a fall show.

WORCESTER, MASS.—At a recent meeting of the directors of the Horticultural Society a communication was received from the New England Agricultural Society advocating the union of the exhibitions of the two societies in September next as was done last year. The departure, however, having proved somewhat unsatisfactory last year, it was voted inexpedient to accept the invitation, consequently the regular horticultural exhibition will be held at Horticultural Hall on September 6, 1894.

KANSAS CITY, MO.—The Western Association of Wholesale Nurserymen held its annual meeting in this city June 19. Twenty-three firms were represented. From reports made it appears there is no surplus of stock on hand but what can be marketed with a good year for the trade. Some loss of stock was reported in the south on account of the freeze last March. The officers of the association who were present were: President H. T. Kelsey, of St. Joseph; Vice-President R. H. Blair, of this city; Secretary and Treasurer U. B. Pearsall, of Fort Scott.

SPRINGFIELD, MASS.—The annual rose and strawberry exhibition of the Hampden Horticultural Society was held on June 19 and 20. Admission was free and a large crowd of visitors attended. The show, while not large, was excellent as to quality. The Miellez Horticultural Co. was the largest exhibitor of roses. Other choice collections were shown by E. H. Howland, Dr. E. A. Reed, E. Young, R. H Smith, L. D. Boyington, C. L. Simons and others. A. N. Pierson showed tea roses, W. T. Hutchins and L. D. Robinson, sweet peas; C. R. Miller & Co, palms; and B. L. Bragg Co., hardy perennials. The strawberries from A. B. Howard were very fine. The society will hold a special sweet pea exhibition.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—First-class propagator, 16 years' experience; state terms.
PERMANENT, care American Florist.

SITUATION WANTED—Young man to take charge; 15 years' experience; references.
FLORIST, care American Florist.

SITUATION WANTED—Young man, foreman or assistant, experienced; commercial or private.
ABILITY, care American Florist.

SITUATION WANTED—By experienced gardener as working foreman in good commercial or private place; married, age 31. Address J. E. S., care Girdwood, Phillips Square, Montreal.

SITUATION WANTED—By Sept. 1st, by a young man, age 22; 8 years' experience. Can furnish good references Address
W. C. MORLAN, Patmos, Mahoning Co., O.

SITUATION WANTED—By a sober and willing young man in a commercial place as assistant; good rose grower and design maker; best references. Address A B C, care American Florist.

SITUATION WANTED—By thoroughly educated landscape gardener and horticulturist, to take charge of some private or public place in Florida. Best of references. Address
W K, 1219 Christy Ave., Louisville, Ky.

SITUATION WANTED—By young man; life experience in all branches of gardening, both inside and out. Best of references. Private place preferred. Single. Address with particulars
J. MORRIS, 66 Beaver Hall Hill, Montreal, Canada.

SITUATION WANTED—A. E. Ingold, late manager Vaughan's Seed Store, 88 State St., Chicago is open to re-engagement in any first-class seed house, either wholesale or retail; five years at above store. For particulars app y A. E. INGOLD,
865 Hasll Ave., Chicago.

SITUATION WANTED—By a thorough practical gardener in private or commercial place; 13 years experience in growing roses, palms, ferns, etc.; German, age 27, married, no family; best of references; state salary. Address G. care C. Steshel,
1672nd St., Bay Ridge, L. I., N. Y.

Cleveland.

As the mercury goes higher the size of all ros s grows perceptibly smaller, so now in July they are, so to speak, out of sight. This is especially the case in Brides and Mermets. Of course that old salamander, the Perle, is in its element and the best tea rose in the market, while its rival, the Hoste, who distances it in the race for honors during the winter months, is "not in it" at all just now. Roses in general indoors have not been troubled so much this summer by mildew; this no doubt is because of the favorable weather we have been having; the nights keeping pace with the day time, being quite warm. This is unusual here on the lake, as the nights are generally much cooler and the ventilators being left open the first thing you find is a bad case of mildew on your hands.

Business has simmered down to the usual summer dullness, which means an occasional good order which is as an oasis in the desert. We will soon be sending in our weekly report something after the New York fashion, viz: The dullest week in the history of the trade.

The Lake Shore R. R. recently asked for bids to supply them with ten bunches of flowers to be placed in their dining cars every day for the next twelve months. The bunches were to be arranged of one kind of flower, that is not mixed flowers, and were to be rather under a medium size. The lowest bid was $2 a day, but we suppose that was not low enough, as a Chicago florist captured the plum! The question arises if he will make profit enough during the summer to pay the bare cost of the flowers through the winter.

The fancy bedding has been finished in the square. There are twenty-nine large designs representing the different corps badges of the G. A. R.

Mrs. E. C. Wilson had charge of the decorations recently at the Hollenden on the occasion of a banquet tendered the state senators by the different ladies' societies. It was given in honor of the passage of the Woman's Suffrage bill.

L. F. D.

Baltimore.

Ninety-two in the shade means something after the cold and wet of a few short weeks ago. No one cares to venture out except on the way to seaside or mountain, and as a consequence trade is very dull. Sweet peas are plentiful, and so, in fact, is pretty much everything else, and at extremely reasonable rates, one might almost say unreasonable, but for the fact that there really seems little money abroad to purchase necessaries, let alone such luxuries as flowers, unless at very low prices.

Well, the farmer must have his innings though the florist suffer, and it is fine harvest weather, apparently come to stay a while too.

How are the chrysanthemums? One of our prize winners says he has standards five feet high, and bush plants in proportion now. Most of the growers seem to prefer keeping "mum" about their plants, but no doubt a scout around among them will show improvement over last year's.

MACK.

Toronto.

The weather still keeps very hot, with an occasional shower, but the showers are scarcely numerous enough to keep pace with the extreme heat, and grass is beginning to scorch in exposed places. Bedding plants are however doing very well all round, and at their present rate of growth will soon cover the ground.

The Association turned out well for the afternoon "off" last Wednesday and indulged in a cricket match East vs. West. Mr. Chambers being an enthusiastic cricketer keeps a part of the Exhibition Park in specially good order for the game, so that the boys were able to show their science in good style. It was a most enjoyable afternoon.

The schools have been closing this week, and a little business has been done, but it was merely a flash in the pan, and one may say that the season is practically closed. Everyone who can afford it is seeking a cooler locality now.

E.

JACKSONVILLE, ILL.—Mr. Frank Heinl, the florist, has been nominated for county clerk by one of the leading political parties.

"I WOULDN'T PART WITH THEM IN MY BUSINESS FOR $300.00!"

So spake a prominent florist ere six months had elapsed in his use of a set of

Long's Florists' Photographs.

Others echo similar expressions. A cause and reason exists for hearing such expressions, and is flattering to the photographs.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

D. I. BUSHNELL, St. Louis, president; S. E. BRIGGS, Toronto, 1st vice-president; A. L. DON, 114 Chambers street, New York, secretary and treasurer.

Mr. C. CROPP is now in Paris.

VISITED CHICAGO: Mr. S. Y. Haines, of Minneapolis, Mr. George Urquhart, vice-president Plant Seed Co., St. Louis.

SWEET PEAS.—A very interesting article by Rev. W. T. Hutchins on sweet pea seed growing in California appears on page 1159 of this issue.

MR. F. D. WOLFROM, manager of the Huntley, Cransom & Hammond Seed Separators, exhibited their No. 6 Monitor machine in operation at the warehouse of the Steele, Briggs, Marcon Seed Co., showing it to about 50 interested representatives of the Seed Trade Association, at the late Toronto meeting.

BROMUS INERMIS.—Mr. Geo. C. Watson, Philadelphia, calls our attention to a special bulletin issued by the U. S. Department of Agriculture May 23, in regard to this valuable forage plant. A small wood cut showing the different parts of the plant illustrates the text and will be found useful for catalogue purposes. Mr. Watson notes the trials made by the Experiment Station at Berkeley, Calif., and of the great value of the plant for the arid regions of the west. The bulletin may be had free from the Department by any seedsman interested.

Free Seed Distribution.

The Farmers' Club held a meeting in Am. Institute, West 38th street, New York, June 12. Among other matters discussed was that of government seed distribution.

P. Meyers of Belleville, N. J., entered into a vigorous defense of the Department of Agriculture. He said that he had, through the kindness of the Congressman of his district, received several consignments of seeds from Washington, and they were every bit as good as those he had been in the habit of paying his good money for. He regarded the government distribution of seeds as being right in the line of public policy.

Mr. Fowler interrupted him to ask whether any of the seeds he had received from Washington had been of a kind that he could not have purchased in the old fashioned way, and Mr. Meyers confessed that they had not. Where upon Mr. Fowler asked what obligation the government was under to buy seeds for folks who could afford to pay for them. Mr. Myers did not appear to have looked at the matter in that light, for he sat down sudden.—*N. Y. Herald.*

Catalogues Received.

The Horticultural Co., Boskoop, Holland (L. C. Bobbink, Hoboken, N. J., American representative), roses and nursery stock; Levavasseur & Sons, Ussy (Calvados), France, nursery stock; The Tokyo Nurseries (F. CHEAP CUT FLOWERS

may be had from bulbs in winter and spring. We now offer bulbs at prices that you can buy and pay for them. When in bloom they will be a great help to you to offer cheap flowers to the public. They occupy very little room in your greenhouses, can be forced very quick, nearly three times as quick as other stuff, and produce flowers of very gay colors at a time when other stuff is rather pale and dull. Bulbs in bloom can be sold at a price in the reach of every one.

References as to the quality of our bulbs we can give you to nearly all the leading Bulb Importers in the United States.

Ask for our 1894 Catalogue.

Forest Lawn Cemetery, Buffalo.

I owe a big "vote of thanks" to everybody's friend, William Scott of Buffalo, because, when wife and I dropped in on him Saturday evening after the Nurserymen's convention at Niagara to ask what we could best see in the one hour we had got for Buffalo, he promptly said in big capital letters, "Go to Forest Lawn cemetery." Well, we went; and we were glad we did, for the run through this superb resting place made us almost willing to abandon the sunny banks of the Susquehanna and move to Buffalo, that we might finally await the last trump amid such loveliness. Would that the broad taste that makes this burying place a lovely park, with no suggestion of morbid grief or heathenish display, might spread to many other cities! Not a fence; not a hedge; no set "lots;" just memorials in granite and marble amid God's memorials in tree, flower and turf, hill and dale!

Friend Scott was up to his ears in business; in fact, he hadn't ears enough, for while one was glued to a telephone, the other was trying hard to listen to "us" and the several customers who were receiving attention. It was pleasant to get where moss couldn't gather anywhere, and were glad of the visit!

J. HORACE MCFARLAND.

Bermuda's Charms.

Under date of June 25 Mr. Burt Eddy writes from Hamilton, Bermuda, as follows:

"I have at last found the place where one can get change and rest: 'The landlord gets the change and the waiters get the rest.' The fried chicken and the tuberoses of the south have lost their charms to me forever. I did not know I was so fickle. The beauties of these islands (scenic I mean) suggest rhapsodies. The 'dusky belles in the bosky dells' compare with those of the Orient. The gustatory delights fill the bill also: Bananas in the back garden and fresh on the table like ordinary 'garden sass,' dates, figs—and more than that: Palms, ficus, agaves and yuccas for ordinary lawn plants, and a night blooming cereus opening now at my window. But what could one expect in Bermuda?"

A Floral Column.

Noticing in a daily press dispatch from St. Joseph, Mo., that on Decoration Day "A beautiful floral column, surmounted by a white dove, was unveiled and dedicated to the unknown dead of the Platte purchase," we wrote to a florist of that city for fuller information about it. He replies: "The floral column consisted of a stake driven into the ground and an inverted wire bell frame fastened to the top; a draciena was placed inside and the frame covered with vines and mixed flowers, with a dove perched on one side. Where the unveiling came in I do not know."

WHENEVER you want anything pertaining to the trade, and do not find it offered in our advertising columns, write to us and we will take pleasure in assisting you to find what you want.

If you use straps you want to spare your PATIENCE, TO SAVE YOUR TIME, and to prolong the life of your STRAP. I'm a grower, / had to. Hence this buckle fixture The WORKEASY TRADE MARK

THE AMERICAN FLORIST CO.'S

DIRECTORY AND REFERENCE BOOK

FOR 1894

CONTAINS THE FOLLOWING:

1. The names and addresses of the Florists, Nurserymen and Seedsmen of the United States and Canada, the exact branch of the business each is engaged in being indicated.
2. A separate list of firms that issue catalogues, the space devoted to each branch of the business in each catalogue being also given.
3. A list of the names and addresses of superintendents of leading parks in the U. S. and Canada.
4. A list of the principal cemeteries of America at which the arts of the landscape gardener and florist are used in beautifying the grounds.
5. A complete, alphabetically arranged list of Roses in commerce in America, with class, habit of growth, date of introduction, name of introducer, and brief, accurate descriptions of the flower of each. Synonyms are also plainly given.
6. A complete, alphabetically arranged list of Chrysanthemums in commerce in America, with class, and brief, accurate description of each. Synonyms are noted and varieties that are very popular with American growers are designated by a star, and this year's introductions by a dagger.
7. A complete, alphabetically arranged list of the Carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each.
8. Seasonable Hints for the year, arranged in weeks, written by Mr. William Scott, and covering every detail of a general florist business. This is decidedly the most valuable contribution to the literature of the trade ever published. It is written in a plain, practical way, by a man who knows what he is talking about.
9. A historical sketch of the Society of American Florists from its organization to date, including officers for each year and lists of essays read at each meeting, with other information of interest.
10. A similar historical sketch of the American Association of Nurserymen.
11. A similar historical sketch of the American Carnation Society.
12. A similar historical sketch of the American Seed Trade Association.
13. Similar historical sketches of the Florists' Hail Association of America; of the National Chrysanthemum Society of America; of the Florists' Telegraph Delivery Association.
14. A complete list of all National and Local Trade Organizations, with names and addresses of principal officers, time and place of meetings, etc.
15. Statistics of Commercial Floriculture in the U. S. from the last census.
16. Statistics of the Nursery Industry in the U. S. from the last census.
17. Statistics of Seed Growing in the U. S. from the last census.
18. A list of Leading Horticultural Societies, with name and address of the Secretary of each.
19. Full information about Express and Postage rates on plants, shrubs, trees, seeds and bulbs

No less than 270 pages of valuable reference matter in compact form, and all UP TO DATE.

PRICE $2.00 POSTPAID.

JOSEPH HEINL, Jacksonville, Ill.

Buffalo.

A very short line from our little city on the Hamburg Canal will explain the condition of affairs. In the first place the thermometer is altogether too high. Business is entirely flat. And as reasonable creatures we don't expect it to be much better for some time. There are few good flowers of the standard sorts to be seen. Roses fall to pieces while you are extolling their long keeping qualities to a customer, and if they did keep they are scarcely "a thing of beauty." There is some fine Lilium auratum in the stores, making the atmosphere really too dense for the average customer. Mud turtles are coming in and so are water lilies, both white and pink. The only really good flower we now have in abundance is the carnation, of which there is a great abundance, and they are fine in quality and quantity, the old heads having not forgotten that shade and plenty of moisture are the chief essentials to secure good carnations in summer.

There are plenty of social matters talked over among the fraternity just now. One is that we should all get together and have an excursion down the Niagara River. That would be more than nice; in fact it would be "awfully jolly." Then there is the annual game between Rochester and Buffalo at the national game of baseball. It would be impossible to miss that in our annual existence. And last, but by no means least, is the convention at Atlantic City. We have some young blood here that has distinguished itself so remarkably this winter in a city championship that if Philadelphia or Boston read the scores they would quietly but decorously hunt their holes. We will have a team there, and a strong one, and the writer hopes it will be well managed. W. S.

Do you WANT a complete alphabetical list of carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

Grow Swainsona.

The best and most profitable pure white flower grown. Takes the place of Roman hyacinths or lily of the valley, producing spikes of flowers from 4 to 6 inches long, in the greatest abundance the entire year—never out of bloom—lasting well when cut. 100 Swainsona will pay you three times as much as same space in best carnations. No florist should be without this most useful flower. After a trial it will be considered indispensable.

EASY TO GROW.

An exceptionally good and paying cut flower.

Strong young plants, $1.00 per doz.; $6.00 per 100.

Cincinnati.

Extremely warm and tempestuous weather has had its effect on the cut flower trade. There is plenty of stock in the market, but it is very poor as a general thing. Sweet peas are more than plentiful; feverfew, cornflowers, larkspur, valley, roses and carnations make up the assortment handled by the commission houses.

Cincinnati florists are quiet so far as work is concerned, only a few orders coming in, principally funerals and weddings.

The Florists' Club is getting ready for its first annual picnic, which will be held at Woodsdale Island about July 26; a positive date will be given later. The growers are already challenging the store men for a game of ball, and we have some very expert quoit pitchers, especially Otto Walke. We also extend an invitation to all brother florists to join us on this occasion, and will insure one and all a good time.

A storm passed over this section of the country June 26, doing great damage to agricultural crops, nor did the florists escape entirely, nearly all the boys coming in for a few broken ventilators or glass, but nothing very serious.

Henry B. Glins was visited by a burglar recently at his home, but the marauder was frightened away by Mr. Glins.

Julius Peterson, whose present establishment consists of nine large houses, is about to add a palm house 25x125. Adiantum Farleyense is one of Mr. Peterson's specialties, the remainder of his place being in roses, chrysanthemums, and violets. He heats by steam, using a 60 horse power boiler.

Chas. S. Barnaby, Columbus, Ind., was recently in town. G.

Eucharis Amazonica.

I have read the several notes on Eucharis amazonica and would say that it blooms with me to perfection. I have now in bloom two large tubs, one with 23 flower scapes with 5 to 7 blooms on each. It blooms twice a year, at any season according to treatment.

Columbus, Ga. S. J. SAULS.

Prices Lower Than Ever.

Toads in the Greenhouse.

I would like to call attention of florists to an old insect destroyer, which I have been using successfully in a (to me) new line of usefulness; namely, the common toad. All know it as a friend to the gardener in the open ground, and I will give my experience in brief with them in the greenhouse.

A few years ago I was much troubled with slugs and millipedes in some of my greenhouses, and in spite of all remedies could not dislodge them. I tried the experiment of a few toads in each house, and they soon cleared the pests out and have kept them out. They not only work all night, but on cloudy days; and under dark benches, a portion of bright days. In houses they hibernate only a few weeks in December and January and they will have done their work so well previously that the pests will not give trouble before they are again awake and at work on them. All they need is a small pile of loose soil to burrow in, in a cool place under the bench, and occasionally give one or two of them a lift onto your benches among large plants that they cannot injure in hopping around. Their keen eye and quick tongue will capture every insect in sight and you will find them invaluable, especially in forcing houses and pits, and vegetable houses.

Sussex, N. B. H. E. GOULD.

A Large Abutilon.

Messrs. H. W. & C. Pierce, Woonsocket, R. I., have in one of their greenhouses a white abutilon with a stem 6 inches in diameter at the surface of the ground and 3 inches in diameter at a height of 5 feet from the ground. The crown covers 120 square feet of space. The plant is very vigorous and produces immense quantities of flowers. Mr. Pierce has not kept a record but estimates that they cut about 50,000 blooms a year and this seems to be a conservative figure.

The Spring Plant Trade.

REPORTS FROM ALL SECTIONS.

Following we give reports on the plant trade secured from various sections of the country:

WHEELING, W. VA.—Spring plant trade was about 25% less than last year. Average price of 4-inch geraniums was about 90 cents a dozen. Collections are very difficult indeed.

COLORADO SPRINGS, COL.—Spring plant trade was ½ that of last year. The average retail price of 4-inch geraniums was $3 a dozen. There was a decided decrease in the call for bedding plants.

PORTLAND, ME.—Spring plant trade was ⅓ less than last year. Geraniums in 4-inch pots retailed at an average of $1 a dozen. Collections are a little harder than usual. We had plenty of surplus stock left on hand.

ROCKFORD, ILL.—Spring plant trade was somewhat less than last year. The average price for geraniums in 4-inch pots was $1.75 a dozen. Collections difficult. On the whole spring trade was decidedly less satisfactory than last year.

DAYTON, O.—Spring plant trade was about 20% better than last year. The average price of 4-inch geraniums was $1 to $1.25 a dozen. Taking everything into consideration spring plant trade was more satisfactory than last year.

SARATOGA, N. Y.—Spring plant trade was about the same as last year, possibly a little less if any difference. Geraniums in 4-inch pots retailed at $1.50 a dozen. An increased call for French cannas for bedding. Collections are difficult.

TOLEDO, O.—Spring plant trade about 25% smaller than last year. Average retail price for 4-inch geraniums $1 to $1.25 per dozen. Collections very much more difficult. Spring trade not as satisfactory as last year by considerable.

ROCHESTER, N. Y.—Spring plant sales about ⅓ less than last year. The retail price of 4-inch geraniums was $1 a dozen. Collections difficult. Of course after noting above you will see that our spring trade was not as satisfactory as last year.

LAWRENCE, KAN.—Spring plant trade was about the same as last year. Average price of 4-inch geraniums was $1.50 per dozen. Collections are no more difficult than last year. Taking everything into consideration trade was quite as satisfactory.

MINNEAPOLIS, MINN. — Spring plant trade was about 15% less than last year. Average price of 4-inch geraniums at retail was $1.50 per dozen. Collections are no more difficult than last year, but last year was bad enough, so that there is not much to brag about.

DETROIT, MICH.—Spring plant sales were a little less than last year. Good 4-inch geraniums retailed at $1 to $1.25 a dozen. We noted an increase in the call for the new cannas. Owing chiefly to the cold season spring plant trade was not as satisfactory as last year.

YOUNGSTOWN, O.—Spring plant trade showed a decrease of about 50% from last year. The average price of 4-inch geraniums was $1 a dozen. Collections are very difficult. Taking everything into consideration the spring trade was not nearly so satisfactory as last year.

OTTAWA, CAN.—Spring plant trade was about 25% less than last year. Average retail price of 4-inch geraniums $1 a dozen. Collections much more difficult than last year. Taking everything into consideration trade was not as satisfactory. Many of the best places have the beds sodded over.

AKRON, O.—Sales about the same as last season. Retail price for 4-inch geraniums $1 a dozen. The principal demand was for geraniums for bedding out, and there was a decrease in the call for house plants, such as begonias, azaleas, etc. Collections somewhat more difficult than last season.

ADRIAN, MICH.—Spring trade was about 40% less than last year, with a special decrease in the call for verbenas and coleus. The average price of 4-inch geraniums was $1 a dozen. Collections are more difficult. In view of the above of course spring trade was not as satisfactory as last year.

COLUMBUS, O.—Spring plant sales were 5 to 10% less than last year. Average price of 4-inch geraniums was $1 a dozen. A decrease in the call for verbenas. Collections are no more difficult than last year. Taking everything into consideration the spring plant trade was not quite as satisfactory as before.

NEW HAVEN, CT.—Spring plant trade was about the same as last year. Average retail price of 4-inch geraniums was $1.50 a dozen. There was more call for geraniums and vase plants and less call for chrysanthemums. Taking everything into consideration spring plant trade was about as satisfactory as last year.

MUSCATINE, IA.—Spring sales were about 20% greater than last year. Average price of 4-inch geraniums was $1.75 to $2 a dozen. There was a small increase in the call for all kinds of bedding plants. Collections are very poor. Taking everything into consideration the spring plant trade was little better than last year.

LOUISVILLE, KY.—Total sales about 20% less than last year. Average price at retail of geraniums in 3½-inch pots was $1 a dozen. The main call was for smaller and cheaper plants than heretofore. Collections have been very difficult. Unfavorable weather had a great influence on our trade in addition to the poor times.

NEW LONDON, CT.—Spring plant trade was about the same as last year. Geraniums in 4-inch pots retailed at $1.25 a dozen. There were fewer coleus sold; an increased demand for palms. Collections are more difficult than last year. On the whole trade was rather more satisfactory. There were more buyers of small lots for cash.

CINCINNATI, O.—Spring plant trade was about 10% larger than last year. Average price of 4-inch geraniums $1 to $1.25 a dozen. No especial increase in demand. Geraniums had the lead. Collections are decidedly more difficult. Taking everything into consideration the spring trade was not quite as satisfactory as that of last year.

CLEVELAND, O.—Spring plant trade was one-fourth less than last year. Good 4-inch geraniums retailed at 75 cents to $1 a dozen. There was not as much call for foliage plants. Collections are slower. Taking everything into consideration trade was not as satisfactory as last year, as less stock was sold and prices were lower.

GRAND RAPIDS, MICH.—Spring plant trade was about 40% less than last year. Average retail price of 4-inch geraniums was 75 cents a dozen and some very good plants were sold at 50 cents a dozen. The best call was for geraniums, there being a decrease in the call for other plants. Collections are about the same as last year.

TERRE HAUTE, IND.—Spring trade was about the same as last year with an increased call for blooming plants, particularly geraniums. Collections were a little slower than usual. The average price per dozen for geraniums in 4-inch pots was $1.50. Taking everything into consideration spring trade was as satisfactory as last year.

PROVIDENCE, R. I.—Total sales of plants this spring were about equal to last year. Average retail price of well grown geraniums in 4-inch pots was $1.25 per dozen. There was a decrease in the call for verbenas. Have found it no more difficult to collect this year than last. Taking everything into consideration spring trade was quite as satisfactory as last year.

ST. JOSEPH, MO.—Spring plant trade was about the same as last year as near as we can get at it. There was a better call for fuchsias and begonias and a lighter demand for ever-blooming roses. Collections were slow last year, and are about the same this season. Taking everything into consideration the spring trade was as satisfactory as last year.

RICHMOND, VA.—Spring plant trade was about the same as last year. Fine 4-inch geraniums retailed at $2 a dozen, and extra fine ones at $3 a dozen. There was an increased call for hydrangeas and pot roses. Extra good plants of anything sold well. Collections much slower than last year. Taking everything into consideration we are well satisfied with the trade.

DES MOINES, IA.—Spring plant trade was about 30% larger than last year. Average retail price of 4-inch geraniums $1.50 to $2 per dozen, an increased call for geraniums, decreased call for sweet alyssum, mignonette and small stuff. Collections were rather better than last year. Taking everything into consideration spring trade was quite as satisfactory as last year.

BUFFALO, N. Y.—Spring plant trade was about the same as last year. Retail price of 4-inch geraniums was $1.50 a dozen. We noted an increased call for cannas, caladiums and geraniums. Less call for carpet-bedding plants. It is almost too early to speak definitely about collections. Taking everything into consideration the spring trade was as satisfactory as last year. There are only a few grumbling.

KANSAS CITY, MO.—Spring plant trade about the same as last year. The average retail price of geraniums in 3½-inch pots was $1.50 per dozen; in 3-inch pots $1 a dozen. There was an increase in the call for geraniums and roses, also tuberous begonias and hydrangeas. Collections are more difficult this year. Taking everything into consideration spring plant trade was just about as good as last year.

UTICA, N. Y.—Spring plant trade was about 1-5 larger than last year. Retail price for 4-inch geraniums was $1 a dozen for ordinary, and for extra fine $1.50 a dozen. We noted an increased call for hydrangeas, palms and ornamental foliage plants. Collections were more difficult than last year. Taking everything into consideration spring trade was about as satisfactory as the previous year.

NEWARK, N. J.—Spring plant trade was not quite equal to last year, but was not very much less. The average price per dozen of 4-inch geraniums was $1. There was a decrease in the call for coleus and an increased call for monthly roses. Collections were about the same as last year. Taking everything into consideration spring plant trade was not quite as satisfactory as before.

ALBANY, N. Y.—Spring plant trade was about 10% larger than last year. Average price of 4-inch geraniums was $1 to $1.50 a dozen. There was an increased call for pansies, roses, hydrangeas and petunias. Collections do not seem to be any more difficult than last year. Taking everything into consideration spring trade was quite as satisfactory as last year with the exception of prices being a little lower.

MEMPHIS, TENN.—Spring plant trade was about ⅓ larger than of last year. Plants sold well. Good 4-inch geraniums retailed at $1.25 to $1.50 a dozen, 3-inch pots at 75 cents to $1. Alternantheras never sold so well; people use them largely now. It is very hard to collect, much harder than last year. Taking everything into consideration spring trade was as satisfactory as last year though more plants were sold at cheaper prices.

BURLINGTON, VT.—Spring plant trade was about 15% larger than last year. First-class 4 inch geraniums were sold at $1.25 a dozen, though the larger number retailed at $1 a dozen. The main increase was in the call for bedding plants, such as geraniums, coleus, cannas, etc. Collections are somewhat more difficult than last year. Taking everything into consideration plant trade this year was more satisfactory than last.

LITTLE ROCK, ARK.—Spring plant trade was about the same as last year. Geraniums in 4-inch pots retailed at $1 a dozen. There were more calls for geraniums and coleus and less for roses. Collections are no more difficult than last year and taking everything into consideration spring trade was quite as satisfactory as the previous season. Cut flower trade during the past year has been at least 25% better than before.

DAVENPORT, IA.—Spring plant trade showed a slight increase of about 10%. The average price of 4-inch geraniums was $2.50 a dozen, that for 3-inch plants $1 a dozen. There was no increase for any special plant, but there was a larger call for window box and vase plants. Collections were fairly good and certainly no worse than last year. Taking everything into consideration spring plant trade was quite satisfactory.

MILWAUKEE, WIS.—Spring plant trade was about 10% smaller than last year. The average retail price for 4-inch geraniums was $10 a hundred. There was a trifle less call for coleus and more for shrubs and hardy perennials. In regard to collections it seems easier to get in new made accounts but the old ones were very slow. Taking everything into consideration the spring plant trade was a trifle more satisfactory though not quite so large as last year.

PARKERSBURG, W. VA.—Spring plant trade was about the same as last year. There was some increase in foliage plant bedding but a falling off in sales of verbenas and the like. Very few geraniums were sold in 4-inch pots; the bulk were in 3-inch pots and retailed at $1 a dozen with pots reserved. There was an increase in the call for decorative plants, palms especially. We have not found collections more difficult, in fact they were better and we were not taking any risks. Considering the hard times we are very well satisfied with our spring plant trade.

SPRINGFIELD, ILL.—In volume spring plant trade was about the same as last year, but in total value of sales it was about 10% less. Some florists report sales of 15 to 20% less, but this is offset by the new florists, which brings it up to the percentage above stated. First-class 4-inch geraniums retailed at $1.50 per dozen but some were sold at $1.25. There was a decided demand for scarlet geraniums and good dwarf cannas. Collections are slow but not desperate, may be called fair. Taking everything into consideration the trade was not as satisfactory as last year. One party reports having thrown away over 4000 coleus and a lot of other small stock.

DENVER, COL.—Spring plant sales were about ⅓ less than last year. The average retail price per dozen for 4-inch geraniums was about $1.50. It should be explained, however, that the larger firms charged from $2 to $2.50 a dozen, but good plants could be bought for an average of 5 cents each from peddlers, thus bringing the average to about $1.50. Accounts have been decidedly more difficult to collect. Taking everything into consideration spring trade was not as satisfactory as last year. Of course the hard times have so affected the trade that this season's business can hardly be taken as a criterion for anything. The demand for well grown stock at a slight advance in price over ordinary stock has been marked.

PEORIA, ILL.—Spring plant trade was about 10% larger than last year. Average price for 4-inch geraniums was $1.50 a dozen. An increase in the call for coleus. Collection of accounts was at least 10% better than last year. Taking everything into consideration spring trade was more satisfactory. Plant trade generally has been on the boom here. Our city has spent a few dollars for plants, making the parks and lawns look much more beautiful. Even the florists have flowers planted out in ornamental design and have cleaned up a little, thus stimulating more interest in flowers. Florists, above all, should keep their places clean and do plenty of ornamental work with plants, and push to the front with every new idea.

HOUSE OF AMERICAN BEAUTY ROSES FOR SUMMER CUTTING

House of American Beauty Roses.

We present herewith an engraving from a photograph of a house of American Beauty roses grown by Mr. Wm. Scott, of Buffalo, N. Y. Regarding the house Mr. Scott writes:

"The bench is 88 feet long and 7 feet 6 inches broad, and there are just 466 plants on it. The house is an equal span running north and south, all the better for summer use. About the first of last July I planted this bench with a fine lot of healthy young Beauties. They grew as finely as it was possible for this fine variety to grow and paid well during September, October, November and December. At New Year's I was picking but a dozen or so a day, and as I had 1,500 longiflorum lilies that wanted a light house and high temperature I lifted the roses, cut them down and potted in 6-inch pots. After a cool month or two the roses were brought along and most of them sold well during April and May. As soon as the roses were lifted I leveled off the bed, beating it down even and solid, then stood the lilies on the soil, but was careful to put a piece of tarred paper under each pot. This was to keep the worms from the lilies and prevent the soil from getting too wet, and the young man who watered the house was told to let as little water as possible reach the soil. The lilies all went at Easter, then the soil was roughly dug up, allowed to dry out, a little bone meal was thrown over the soil and well worked in and on April 2 the bench was planted with healthy, young plants from 3-inch pots. They were propagated from the tops of the old plants. When lifted in January some knowing friends laughed when I said I would pick good roses by June 1.

"Here is the record, just as the 'log' was kept: 'Began cutting a few Beauties from No. 3 house on May 28, and cut up to June 9 about 30 in all. On June 10th 10, the 11th 6, the 12th, 9, 13th 8, 14th 9, 15th 30, 16th 54, 17th 114, 18th 130, 19th (this evening) 146.' I don't expect to keep up this high water mark for many days, but there is every appearance of cutting from 50 to 75 a day for months to come. They were planted solely for a summer and fall crop and in November, unless they are paying wonderfully well, will be lifted and the house used for lilies.

"A well known Beauty grower of Chestnut Hill remarked to me last fall that any fool could grow 'Am. Beauty in the fall.' That is perfectly true, yet I believe to grow them for a purely summer crop is not very common. In some cities it may not pay, but in our cool town where people *live* in the summer time there is alway a demand or sale for good flowers. There has not been an imperfect flower cut. The stems have not been long, but not one less than a foot, the average being from 15 to 18 inches long, and of the finest color. I am not pretending there is anything new about it, or clever either, but as I did not read about it or a kind friend tell me how to do it I feel pleased.

"I may be pardoned for alluding to the wilted cabbage rose on the right. It is altogether too conspicuous, but that is entirely the photographer's fault. The picture was taken at 5:45 a. m. June 17, and within 10 minutes the first cut of the morning was made, which was 87."

WM. SCOTT.

THE Russian Government proposes to hold an International Exposition of Fruit Culture and Products at St. Petersburg, beginning September 22d, and closing November 12th, 1894, with the object of showing the present condition in Russia and other countries of the cultivation of fruits and vegetables, of viniculture, the cultivation of medicinal plants, horticulture, and of the manufacture of their products. A Congress of Pomologists will be convened simultaneously with the exhibition. Those who may be desirous of taking part in the International Exhibition or in the proceedings of the Congress are requested to make timely application for further information to the offices of the International Exhibition of Fruit Culture 1894, at St. Petersburg, Imperial Agricultural Museum, Fontanka, 10.

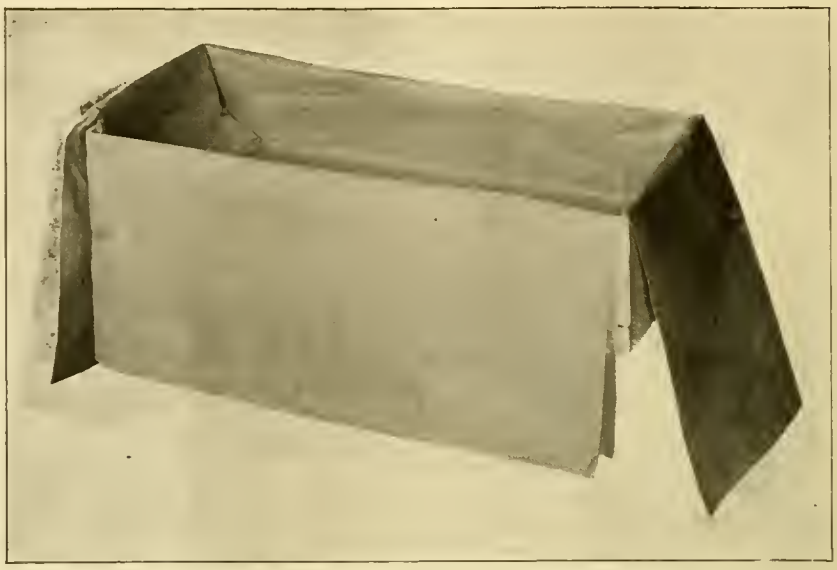
Arrangement of Flowers.

VIII.

CUT FLOWERS IN BOXES.

What a difference in the mode of sending out cut flowers to-day as compared to the manner prevailing some 10 or 15 years ago! And in certain localities we need go back but a few years to the time when tissue paper, or even newspaper, wrapped around the flowers was considered good enough for the purpose. If paper boxes were used these were collected from dry goods houses, and consisted of all manner of shapes and all imaginable colors, such as collar boxes, boxes for neckwear, underwear, millinery, etc.

The cut flower box of to-day is of quite recent date. For many years after second-hand boxes were discarded the boxes mostly in use were those carried in stock by box makers, such as were made for the candy trade in various sizes. For larger sizes millinery and packing boxes were pressed into service. These boxes, however, were in a general way ill suited to the purpose. The 5-pound candy box is still in use in many places, a useful box in many ways, but as a receptacle for roses it necessitates the doubling up of the stems, which, besides being liable to break, can not fail to give the flowers a cramped appearance, which should by all means be avoided.



The great advantages gained by using a flower box of proper shape and dimension are not as fully understood by many of the retail dealers as should be. The cost of boxes in a retail establishment is a considerable item, but the increased cost of the right kind of box over a poor one is but small and it should never be considered. It will pay you in the end to put your merchandise before the public in the most attractive form. Just as sure as you send out a lot of flowers in a soiled and broken down box the recipient will set you down as a slovenly, third-rate concern, and you will find it a rather poor way of advertising. On the other hand put the flowers in a neat and attractive shape, even if it costs 5 or 10 cents extra, and the chances are that you will gain twice the amount on every package sent out by an increased business.

There is no excuse to be without a neat box nowadays, even if you are located a long distance from factories who make the manufacture of these boxes a specialty. The folding box, which is now made in most of our large cities, can be shipped in packages of small bulk so as to make freight charges quite reasonable. The same reason, that of taking up little room, also recommends this style of box to dealers in the city, where the quarters are limited as to space. Still a regularly made up box has some advantages which the former does not possess, but after all these are of minor importance.

The cardinal points are utility and appearance. As to color, soft and neutral tints are preferable to high colors. Cream or light buff tints are usually adopted by the manufacturer of folding boxes and answer the purpose very well, but many dealers prefer to have their stock made according to their fancy.

As far as dimensions are concerned we have some 25 or 30 different sizes, which, however, can be cut down to a much less number and yet give a pretty fair assortment. Let us say:

FOR GENERAL STOCK.	AM. BEAUTY BOXES.
10x4x3.	24x7x4.
14x5x3.	30x8x4½
16x8x3½.	36x11x5.
21x9x4.	VIOLET BOX.
24x10x4.	6x3x3.

BOX LINED WITH TISSUE PAPER AS RECOMMENDED

ARRANGEMENT OF FLOWERS.

Now that we have the right kind of box let us proceed to place the flowers into it in such a way as to display every bud and flower to the best advantage. Let us avoid the practice of packing the flowers in layers like sardines. Select the size of box suitable to hold the desired amount of material without undue crowding, and be most particular as regards length, then line your box with tissue paper in the manner shown in our first illustration. For common use the ordinary grade of so called brown tissue is generally used, but the white is in our opinion preferable, as it gives a neater appearance to the box. Waterproof oil paper is also used, but unless the flowers are sent long distances (and then wooden boxes should be used) the ordinary tissue answers our purpose best. Tinted tissues can not be recommended, as color conflict with the flowers is generally unavoidable. For putting up boxes of violets we are warranted in using a proper shade of purple or blue paper. Also white flowers for funerals, where the box can appropriately be lined with royal purple tissue.

In putting up a box of cut flowers we must be as careful in regard to color effect as in putting up a bouquet or design. Though the flowers are to be removed to be used for various purposes soon after delivery and arranged according to the recipient's taste, still our aim should be to produce the best possible effect upon opening the box.

No special rule for such arrangement can be laid down, as in the majority of cases the flowers are selected by the purchaser. If a box of mixed flowers for a certain amount be ordered we may exercise our best taste in the arrangement.

In our second illustration will be seen a box of such ordinary summer flowers as are in season now, such as roses of various kinds, carnations, sweet peas, a bunch of corn flowers, aquilegia, etc., with of course a few fronds of adiantum. The latter are indispensable in box arrangements of all kinds, but we should be careful not to lay them onto the flowers in a solid layer so as to entirely hide the flowers underneath. Smilax and the coarser kinds of green and ferns should be placed in the box first, which serves the purpose of raising the flowers up, which is especially needed at the end of the box where we place the first flowers, which should always be raised somewhat higher than the other end if a level layer is desired, for the reason that the stems and foliage of the material as we proceed to place will naturally raise the level towards the lower end of the box.

Packing Plants for Shipment.

II.

The packing of plants for shipment during cold weather involves a much greater expenditure both in labor and packing material than is required for summer shipments, and with all possible care taken in the matter there is still much risk of injury. In fact no tender plants should be shipped by freight after Nov. 1, the risk of freezing being too great, for while the transportation agents may to a certain extent be responsible for losses of this character, we all know how difficult it is to collect damages from such agents. It therefore becomes necessary to ship only by express at such times, and even then to use much discretion in the matter.

The first point to be noted in winter packing is to have the foliage on the plants quite dry before wrapping them up, and then to begin the tying up in the same manner as has been recommended for warm weather, but after having drawn up the foliage and given it the preliminary tying, a further covering of four to eight or ten thicknesses of paper should be given to the whole of the plant, either newspapers or straw paper, 20x30 inches in size being convenient for this purpose. It is best to begin at the top of the plant in the case of a tall palm, and then to lap each succeeding length of papers enough to make a complete covering, each paper being tied securely in place. And in order to work to the best advantage the packers should work in couples, one to keep the wrappings in place while the other does the tying. After the entire growth of the plant is securely covered right down to the surface of the soil, it should be turned out of the pot, any superfluous soil removed from the ball and then the latter thoroughly wrapped in several thicknesses of paper.

Small plants ranging in size up to 4-inch

BOX FILLED WITH FLOWERS.

ARRANGEMENT OF FLOWERS.

pots can frequently be rolled up in several layers of paper, without going to the trouble of first tying up the foliage, and instead of wrapping the roots in a separate paper it will be found quicker and not very expensive to slip them into a paper flower pot, this contrivance being quite convenient for the purpose.

The box should then be prepared for the reception of the plants by a thorough lining of at least two thicknesses of felt paper such as is used for lining buildings, this being tacked to the interior of the box in such a manner as to completely cover all cracks. Then give a second lining consisting of a good layer of excelsior, this being carried up the sides and ends of the box as the successive layers of plants are cleated into place, and finally leaving space enough on top of the last layer of plants to cover the whole with a good thick layer of excelsior and a covering of the felt paper before nailing down the wooden cover.

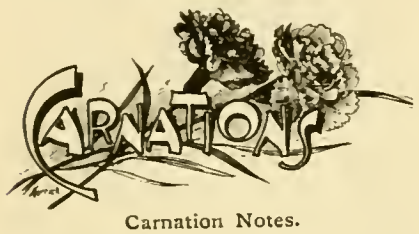
Of course it is understood that no holes for ventilation are required at this season, and all boxes should be made as nearly airtight as possible. For small ferns from 2 or 3-inch pots, and in fact any small stock another method may be adopted, namely, to line the box with the felt as described above, and also give a good layer of excelsior in the bottom, then roll the plants in several thicknesses of paper, and pack them upright closely together in the box, and finally fill in the sides of the box and all spaces among the plants with chopped hay, the latter having been run through a feed cutter that will cut it into about one-inch lengths. The chopped hay should be worked down among the plants so that all interstices are filled up, and the box filled a little above the edges, so that the cover will press down the packing quite firmly and prevent any movement of the plants. By this method I have shipped small ferns quite long distances during severe weather, and always had them arrive in first-class condition.

Plants in flower naturally require very careful packing in cold weather, and for these some cotton batting should be included in the packing outfit, but it should always be remembered that the cotton should never be placed in contact with the flowers if they are destined for a long journey, else the flowers will turn out flabby when unpacked, on account of the cotton having absorbed the moisture from the petals. To avoid this the flowers should first be wrapped in some soft tissue paper, then covered with the cotton, and finally receive another wrapping of paper. With such plants, however, it is not advisable to fill in the whole interior of the box with excelsior, for fear of crushing the flowers, it being safer to give the plants some extra wrappings and to tack in an extra lining in the box.

Rooted cuttings form quite an important item in the shipping trade of some concerns during a few years past, and these can be packed in various ways, according to the weather and length of travel to which they are exposed, but for winter shipping I think it is safest to tie them up in bundles of 25 or 50, then cover the roots with a little damp moss, and again cover the latter with a layer of excelsior, the whole bundle can then be wrapped in several layers of paper and cleated firmly in the end of a well-lined box, this enabling one to pack quite a considerable number in a soap box.

In packing plants of any kind for a long journey, it is much the best policy to use an abundance of nails, for a box that is insecurely nailed is very likely to be a source of much tribulation both to the shipper and the consignee, all expressmen apparently having the faculty of finding out the weak places in such packages. A stencil or two, with which to print "*Perishable Plants*," or some similar legend on every case before it goes out, is also a good investment, and may save some trouble in the adjustment of a claim against an express company.

W. H. TAPLIN.



Anthurium Scherzerianum.

When grown in a warm stove this plant comes into bloom in spring, and makes its growth, which follows the decay of the principal crop of flowers, correspondingly early. The time that this anthurium makes its growth and flowers is a good deal influenced by the temperature in which the plants are grown. Yet when grown in a high temperature the results are not so satisfactory as when it is subjected to an intermediate house all the year around. I have grown this anthurium in the hottest house that a plant could grow, and also that of an intermediate house kept at about 50° at night during the winter months, with proportionally cool quarters in summer, yet when the plant is grown in a high temperature the results are not so satisfactory as when subjected to an intermediate house all the year around. Under this treatment the plants make much larger and stouter leaves and correspondingly larger spathe than if kept warmer. Under cool treatment they fully develop when the spring is well advanced, and last fresh until the end of summer. Most of the growth will be made at the last three or four months of the year.

The best time to repot is just as they commence to grow. As these plants require a large amount of water it follows that the soil in which they are grown, however enduring its nature may be, soon becomes a wet soddened mass, in which the roots cannot remain healthy. To avoid this it is better to pot every year. Where the plant is grown under cool treatment in the way described the potting should be carried out about the latter part of August. All the old material should be shaken from the roots; if any soft pasty matter adheres to them it should be washed away. The best compost in which to grow this anthurium is about half fibrous peat, with the greatest part of the earthy matter shaken out, and an equal part sphagnum moss, which should be chopped, but not too fine; to this should be added broken charcoal, crocks and sand. In this the plants will make more roots than in heavier soil. As the plant is a shallow rooter plenty drainage is needed. Syringe

overhead daily to keep insects in check. A light position should be given, with the plants as near the glass as practicable. Water should be given as soon as the plants are potted, keeping the soil quite wet from the time growth commences until finished, when less is required, but the roots must never become dry. When well managed it is a most desirable plant and is extremely effective in or out of bloom, and with fair treatment it will continue to thrive for a long time.

A. J. E.

Carnation Notes.

Last winter I said something about a tired back from disbudding a house of carnations planted on solid beds; to-day my back is almost broken in two from going over some thirty odd thousand plants in the field and topping them. I have this consolation, and it is worth a tired back, that I know the condition of every plant in the field and that the topping is done just as I want it done. There is nothing succeeds like success, and there is nothing so conducive to success as to attend to all the important details of carnation culture yourself, or at least as far as practicable. A prominent and very successful grower once told me that he did not think it policy for a grower to do any of the manual labor about his greenhouses, yet this same grower when he wants something done especially well and carefully will roll up his sleeves like any other ordinary mortal and wade into work.

Carnations are now supposed to be making themselves in the field, but they will need a little assistance on the part of the grower to do it properly. It is folly to think that plants choked up with weeds and allowed to go without topping will turn out all right in the fall. This style of carnation growing is getting less every year, but one occasionally sees such patches now, and the quicker we get rid of them entirely the better for carnation culture.

Keep the soil well mellowed and all weeds out of the patch and there is little danger of your plants being injured by a dry spell of weather, such as we often get through July and August. If the plants are a little backward watch your chance, and just before a rain give them some pure ground bone; to do this the ground should be loose, so that it has a good chance to soak in when it rains. A watering with manure water will also be beneficial, but it should be done just before a rain to be of the most benefit. Keep treating your plant with the rust formula, and at the same time keep a sharp lookout for the rust, and when you find any treat it vigorously; if you can't spare the plant pinch off the affected leaves and give the plant special attention, for it is poor policy to allow any of the spores to develop in the field, where they have so much of a chance to be carried over the entire patch by the wind.

It is not a bad idea to go over your patch and make some little memoranda of the various characteristics of growth in the different varieties. Where you find a variety making slow growth with the same advantages as the one alongside, which is making a good strong growth, you will probably want to give that variety a little more feed in the house to get the best results. Where you find one of rank growth and inclined to be sprawly you will want to plant it where it can be well staked.

A. M. HERR.

Grouping in a Botanical Garden.

In the accompanying drawing, which is meant to be merely a rough sketch, the round beds appear larger than is necessary; a six foot or even a four foot bed would often be large enough. These round beds would by the selection of material give the garden its distinctive character. They would either be devoted to hardy plants, or to tender exotics of a flowering or foliage character, or both. In any case selection should be carefully adhered to, and no plant admitted permanently before passing the test of adaptability. Generally but one species should be grown in a bed, although many varieties may be used as in water lilies, poppies, pinks, hollyhocks, geraniums, roses, asters, azaleas, primroses, polemoniums, and as in group 25, with lantanas, verbenas, coleus, perillas, variegated mints, thymes, salvias, monardas, stachys, lamiums, callicarpa, vitex, clerodendron, lavender, hyssop, balm, sage, rosemary, or whatever may be selected to represent a group; they should be plants of known adaptability. Otherwise, they should first be tested experimentally.

This knowledge is the most difficult to acquire in every climate, and for this reason I have often urged that parks and gardens be planted in this way. But governors, politicians, and their *engineers* do not seem to regard parks in a sensible or right-minded way. They think it their duty to forward the backing and filling proposed by a college chum may be, chiefly because it will draw the resources of the people into their ever gaping pouches—not because it will improve nature's surfaces, or educate the toilers who make governors and tolerate them.

The number of distinct species of trees, shrubs, and plants which may be grown in a garden of this kind is between 2,000 and 3 000, costing approximately between $1,500 and $2,000 for purchase and incidentals. They may be planted for a similar sum, if the ground is good enough. So you see the *material* of parks and gardens is not the stumbling block it is supposed to be by many. A complete hardy garden is cheap. Even with considerable duplication for masses, it cannot cost much for the plants. In the plan, the 25 foot roads are the only ones gravelled. The woodland roads are grass—they are ever so much cheaper and nicer to walk upon as a rule. It would be possible to hollow out the woodland masses, and arrange seasonal displays for each of the summer months, in which case such a garden would concentrate and present every desirable and instructive feature.

The herbarium and museum would display the "botanical" plants between sheets of paper.

The conservatory is small. The glass in which to grow plants for it is large. Flowering plants should be renewed every week. It is geographically arranged, and so also is the division for economic plants.

The chief feature of course is the instruction to be derived by the aid of classification, and the character of ornamentation, which may be imparted by selecting bedding plants of any desired class—almost all the groups contain a variety to choose from.

A reference to a "Simple botanical classification", published in last year's FLORIST, will render quite easy the technicalities of the divisions and classes of such a garden. The groups are largely explained by their names.

JAMES MACPHERSON.

Trenton, N. J.

Key to Plan.

GROUPS OF THE GENERA PLANTARUM.

DICOTYLEDONEÆ

POLYPETALÆ.

1. Ranales.
2. Parietales.
3. Polygalales.
4. Caryophylales.
5. Guttiferales.
6. Malvales.
7. Geraniales.
8. Olacales.
9. Celastrales.
10. Sapindales.
11. Rosales.
12. Myrtales.
13. Passiflorales.
14. Ficoidales.
15. Umbellales.

MONOPETALÆ.

16. Rubiales.
17. Asterales.
18. Campanales.
19. Ericales.
20. Primulales.
21. Ebenales.
22. Gentianales.

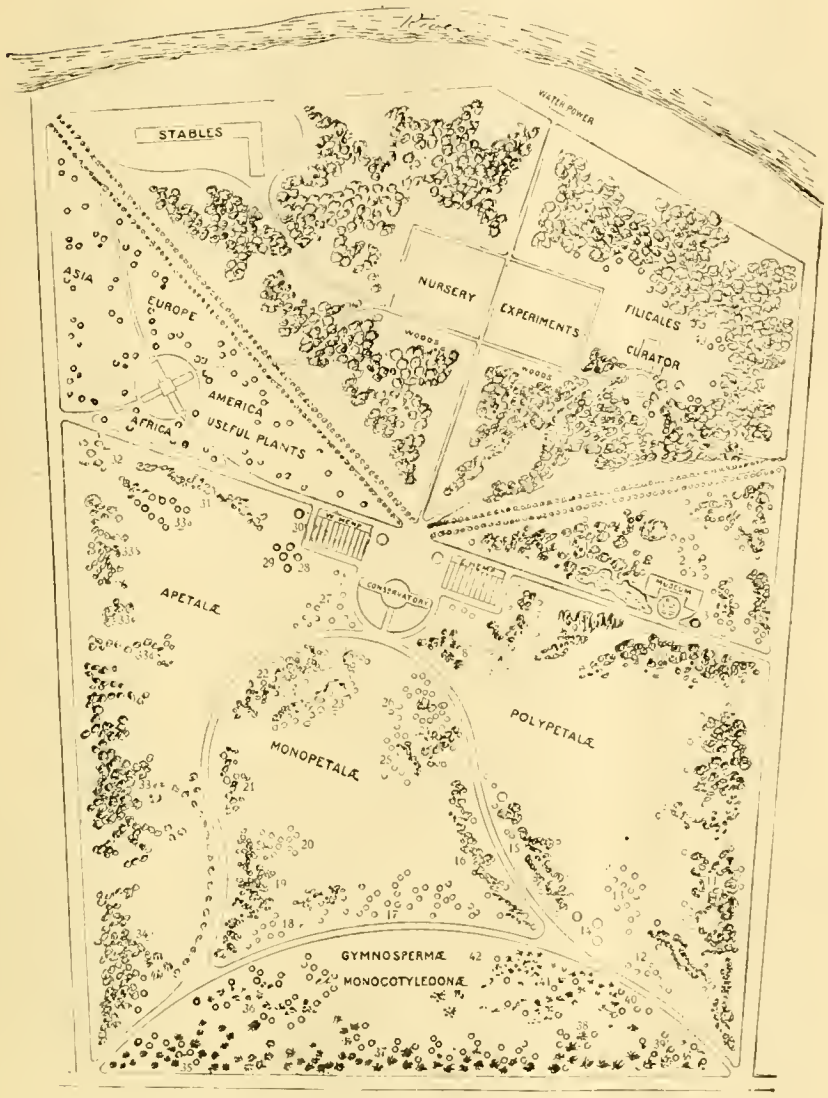
24. Personales.
25. Lamiales.
26. Plantagineæ.

APETALÆ.

27. Curvembryeæ (Chenopodiales).
28. Multiovulatæ aq. (Podostemales).
29. Multiovulatæ ter. (Asarales).
30. Micrembryeæ (Piperales).
31. Daphnales.
32. Achlamydosporeæ (Santalales).
33. Unisexuales (Queniales, etc.).
34. Anomali (Salicales).

(42). Gymnospermeæ (3 tribes).



MONOCOTYLEDONEÆ.

35. Microspermæ (Orchidales).
36. Epigynæ (Narcissales).
37. Coronariæ (Liliales).
38. Calycinæ (Palmales).
39. Nudifloræ (Arales).
40. Apocarpæ (Potomales).
41. Glumaceæ.
43. Filicales (Acotyledoneæ).

Washington.

Business during the past ten days has been quite an improvement on what it had been previously on account of the closing exercises of the public schools, and the graduating exercises of the various educational institutions of the city. All kinds of flowers were in demand, as well as all the various designs used at such times. Now there is almost a complete cessation of nearly everything in the line of flower trade.

The hot and dry weather of the past two weeks is beginning to tell on the grass and shrubbery throughout the parks and reservations. The flower beds are kept in very good condition through constant watering, to do this quite a force is kept busy all day with the hose. There is a marked change (and I think for the better) in the beds in our public grounds this season, Mr. G. H. Brown having carried out his intention of doing away with much of the carpet bedding, echeverias, etc., and substitute the attractive French cannas and many of the annuals which are in constant flower; the beds have a more graceful and subtrop-

GROUPING IN A BOTANICAL GARDEN.

ical appearance; the three varieties of eulalias figure conspicuously in some of the reservations; they will look very handsome in the fall, when covered with their graceful pampas-like plumes. Arundo Donax, both the plain and variegated forms, Erianthus Ravennæ, Eulalia Japonica variegata—E. zebrina and E. gracilis and Pennisetum longistylum might be used in some of the larger reservations, as permanent beds with good effect; they could not fail to attract attention, and would be in the line of economy, as they would not require planting each year. There are one or two of these beds in private grounds about the city, which, for both grace and beauty can not be equaled by any flower beds in the district.

The nymphæas in the fountain basins are beginning to flower quite freely; they make a very interesting and attractive feature of the park decorations, and are admired more and more each season.

Mr. Brown is growing a number of chrysanthemums for fall planting. Last season Col. J. M. Wilson, engineer in charge of public buildings and grounds, exhibited an unusual interest in this very popular flower, expressing a desire to have more of them grown both in the parks and at the greenhouses; they had a magnificent exhibition of pot grown plants last season, among them some very fine seedlings, of their own raising.

The Florist Club has decided not to have a chrysanthemum show this fall. Last fall they had a magnificent display, yet it was a failure from a financial point. The entire work usually falls upon one or two, and hard work it is too with no pay and but little glory; this year, those few upon whom this work usually falls did not feel like taking upon themselves the great work and responsibility of getting up another and the inexperienced were afraid of the responsibility, therefore no show. There will probably be several individual exhibitions at the stores of our leading florists. There is to be one or two large food expositions this fall, and some of the boys are talking of renting a space in the hall with the food exhibitors and having a private exhibition; this however has not been fully determined upon, but it is probable.

Mr. Fishback, an amateur living near Anacostia, D. C., has for some time past and is at present supplying some of our florists with the finest sweet peas ever put on the Washington market. He has been experimenting for several seasons with this plant and judging from the flowers he brings in, he must have struck the perfect way of cultivating them. I understand he has quite a piece of ground devoted to their cultivation, and keeps several persons constantly employed gathering the flowers, which are as near perfection as to size and color, as could be. Mr. F. is careful in selecting the most striking shades and tints, discarding everything but the very finest and then growing them for all they are worth. He gives great care to the preparation of the soil, to which he attributes his success. They are all grown in the open ground; such blooms in early spring would bring him a handsome price.

The weather during June was very peculiar, the first ten days having been considerably cooler than usual. One of the coolest days on record for this season of the year was the 6th, with a minimum temperature of 46.3 degrees. The highest temperature was 97.5 degrees on the 24th. During the month the maximum temperature has been at 87 degrees or above on 15 days and 90 degrees or above on ten days. In connection with the high temperature, the month at Washington has also been an unusually dry one, only about 1¼ inches of rain having fallen, or one-fourth of the usual amount for June.

Last week the Washington Athletic Club and the Florists' Bowling Club took a run down the Potomac as far as Marshall Hall, for the purpose of getting a little cool breeze and testing their superiority; the Athletics having challenged the florists for a game of the best two out of three; for three new balls. The first game was easily won by the florists, the second and third were hotly contested, the Athletics securing both, but they had no walk over, capturing the prize by only a few points; after the bowling was over they put the evening in very pleasantly dancing and amusing themselves in many ways.

Very little is being said about the convention, it being so near us this year I presume the boys think it not worth while looking into R. R. rates so early, as that matter can all be attended to at this end of the line, without the usual delay of corresponding. I expect a good many will attend the meeting however; interest usually increases as the time for the meeting approaches. REYNOLDS.

Cleveland.

Why do our southern brethren imagine that the cities of the north can dispose of unlimited quantities of cape jasmines, etc., in the spring when there is such an abundance of home grown flowers. They have made shipments time and again at this season of year, and always with disastrous results so far as our city is concerned. Do they not know that during the months of April, May and June there are thousands of roses, carnations and other staple flowers that go to waste and there is no room for extra stock. No matter if it is a novelty in the market the demand does not justify the trouble and expense of shipping flowers north at that time. Cape jasmines are generally consigned to a commission house who deals in fruits, vegetables, etc., and as they have no way of disposing of them they are sent to one of the florist stores with the request that they place them on sale and report the result. In one lot of seven boxes that we handled this spring the total sales amounted to two dollars. We kept one dollar as our share in the transaction. Can you imagine what the shipper got after the commission man took out the cost of handling and freight charges? This spring some poor deluded soul down in Mississippi sent us a letter

saying he would ship us some magnolia buds and to follow directions that would come with them. In due time the box arrived and the directions noted, which were to the effect that they should be carefully unpacked and placed in water and to await results and then let the shipper know what the demand would be, as he could ship quaatities of them. We are still in doubt as to *what the demand will be*, as the buds failed to budge one peg. And no doubt our friend in the south is wondering at our delay in not wiring for a second supply. The charges on box were prepaid ($1.50).

J. M. Gasser is rebuilding six large houses. Mrs. James Eadie is building two houses, each 20x100. N. Soetga will build a house 16x60.

New York.

The New York Florists' Club held aa interesting meeting on Monday evening, July 9, at which Mr. Edgar Sanders of Chicago read an entertaining paper giving his reminiscences of the florist business. His descriptions of the wonderful construction of the old times called floral designs and of the methods employed in the days of flues, small glass, hand made labels, etc., were listened to with delight and at the close a unanimous vote of thanks was tendered him.

The committee on revision of by-laws reported a large number of important changes and their recommendations will come up for action at the August meeting.

The transportation committee recommended the Central Railroad of New Jersey as having given the best terms for the Atlantic City trip, and it was voted that this route be selected.

Mr. Leuly was confirmed as captain of the bowling team to represent New York at the great tournament which will take place at Atlantic City.

Philadelphia.

There is nothing new to be said of the state of trade, it is the same old summer business as of yore. Carnations seem to be more plentiful than usual at this season and these, with roses and sweet peas make up the average florist's assortment. Gladiolus from outside are now commencing to come in, and vases of these will soon grace the counters and doorways of the stores, the old sign "5 cents a stalk," which by the way is a fixture in some establishments, ornamenting (?) the center of the bunch.

Mr. Verner, gardener to the late A. J. Drexel, and who grew such fine chrysanthemum plants for exhibition, has gone into business for himself near Darby, Pa. He has erected three large houses and intends to do a general business, growing plants and cut flowers. We wish him every success in his new field.

Convention matters are now the main topic of conversation here and things are rapidly getting into shape. The hotel committee visited Atlantic City last week and after a canvass of the hotels and large cottages all doubts as to their being able to house the visitors were dispelled and no one need stay away on that account.

Atlantic City is becoming more attractive every year. There are many handsome residences being added each season and the hotel service is perfect. Originally this place was a deserted village during the winter months, but of late years the majority of the large hotels have been compelled to keep open the season round in order to accommodate the crowds that are continually seeking health or recreation at this now famous resort. A trip to Atlantic means that visitors are to simply throw all cares to the winds and enjoy themselves as they think best, getting both rest and recreation at the same time.

This place is the great playground for the tired and sweltering inhabitants of Philadelphia during the months of July and August. Hundreds of elegant cottages are owned by wealthy residents who make this their summer home, and thousands spend their weeks or months of vacation at the many hotels or cottages who especially cater to them.

Old ocean while always the same, is ever new to the visitor, who will take a chair in one of many of the pavilions along the board walk and gaze for hours on the waves breaking on the strand and listening to their dull monotones, or on the everchanging throng that crowd this most wonderful of all promenades. K.

Hotels at Atlantic City, N. J.

The committee have obtained from the United States, the largest hotel, a special rate of $2.50 per day and a guarantee that they can accommodate four hundred guests. From at least one-half the rooms there is an ocean view, and broad piazzas surround the hotel, from which can be seen an ever moving panorama. There are also many other hotels and cottages who have promised the committee they will make room for the delegates, which list, with prices, is given below.

NAME.	PROPRIETOR.	SITUATION.	CAPACITY.	RATES PER WEEK.
Albemarle,	C. E. Cope,	Cor. Virginia & Pacific Aves.	150	$8.00 to $14.00

Haddon Hall,	Leeds & Lippincott,	North Carolina Ave.	250	18 00 to 30.00
Chalfonte,	Mrs. Roberts & Son,	North Carolina Ave.	250	18.00 to 30.00
Kenilworth,	Mrs. Grubb,	Kentucky Ave. Beach End,	150	15.00 to 20.00
United States,	Mrs. J. S. Davis,	Maryland & Pacific Aves.	Special rate $2.50 per day.	
The Stratford,	(European plan),	Beach End Kentucky Ave.	$1 50, $2 & $2.50 per day; 65 rooms.	

St. Louis.

Affairs have remained quiet during the past week, several large funeral orders being about the only events at all noticeable, although several quite good shipments have been made to Little Rock, Ark., owing to the "Competitive Militia Drill" in progress at that point. About the only stock at all good that is coming in is the summer roses, such as Perles, La France and Niphetos, some of them evidently from young stock. The growers are all busy replanting and straightening up for the coming season, and will soon have finished.

Being at Gratiot station lately, I had the pleasure of calling on Mr. Herzog, who has for the last year had the greenhouses at that place. The plant consists of six 100-foot houses, three 20 and three 10 feet wide. The large houses are planted to roses, smilax and carnations respectively, and two of the smaller ones to carnations, while the remaining one is used as a propagating house. The plant when assumed was in poor shape, but has been steadily improving under the intelligent work put on it. Last season the houses were all reglazed, changing from butted to lapped lights, and a new roof being put on the propagating house. This season the heating system is being changed and several boilers shifted so as to give better and more easily regulated control of the heat; the system is also changed from open tank to pressure, the same pipes being used, however.

One of the most important and best paying improvements is the location of a plunger pump, operated by horse power at the base of the bluff upon which the greenhouses are situated, and which insures an unfailing supply of water during the dryest seasons. The pump is capable of throwing sixty barrels a day, and is used but a short time mornings and evenings, giving an abundant supply. Besides what is used in the houses enough water is had to keep a large patch of carnations in elegant condition, and from their sturdy growth and healthy color it can be seen that they are making ample returns for the water applied.

The rose house contains fifteen hundred plants, mostly Perles, La France, Hoste and Niphetos. A few Kaiserin are also being tried. They have been planted about two weeks and are starting nicely. The carnation houses will be planted principally to McGowan for white, and Portia and Garfield for red. A few Tidal Wave and Daybreak are also being tried. Fifteen hundred McGowan and about the same number of red will be planted. The smilax house has been a great success this season, there having been no difficulty in disposing of every string cut, and it will be filled up in the same manner this year.

Mr. Herzog is a progressive, wide-awake man, and from his conversation it can be seen that it won't be many seasons before his place will be as up to date and convenient as any.

The committee appointed to prepare a list of events to be competed for at the

ARE THEY FIRST-CLASS PLANTS.

florists' picnic have prepared the following, which are mostly open to all: 100 yard dash, running broad jump, potato race for boys and girls under 14 years; slow race, time limit 10 minutes; egg and spoon race, ladies, 25 yards; sack race, 50 yards; 3 legged race, 75 yards; 50 yard dash, boys 14 and under; 50 yard ladies race; tug of war, and bowling contest. It is whispered that the tug of war will be a continuance of the one supposed to be perpetually existing between the retailers and fakirs. The winners will be able to offer up their thanks in smoke, as a box of cigars goes to the winning team. The terms of the bowling contest have not as yet been perfected.

R. F. T.

Are They First-Class Plants.

A subscriber writes us a history of a purchase of rose plants in which the seller had stated (by mail) that his plants were first-class, and he sends us the plants of which we present an engraving herewith as samples of the stock he received. He asks us if they can by any stretch of courtesy be called first-class. While we have some decided opinions on such matters it seemed wise to present the matter to the trade for general discussion, and (sub rosa) as a convincing argument in favor of our oft repeated suggestion that the Society of American Florists take up the matter of preparing a classification of plants by means of which sellers might intelligently offer their stock and buyers make their purchases with discrimination.

Objection has been urged against classification on the ground that it would be impossible to cover all the various little points that distinguish one grade from another. To this we reply that nothing is impossible and that the classification of plants most commonly bought and sold through the medium of correspondence would be certainly no more difficult than the classification of wheat, corn, oats, etc., as now done by dealers in grain.

But don't forget the inquiry. Write us your opinion as to whether the plants illustrated are first-class, and if not, then in what class would you place them: second, third, fourth, or culls?

Chicago.

The cut flower trade is almost at a complete standstill. In local retail circles there is practically nothing doing. Here and there a funeral order serves to break the monotony, but there is little even of that. As Joe Curran expresses it: "People are too hard up to die even, these days."

The shipping trade, what little there is of it at this season of the year, is seriously hampered by the railroad strikes. Very few actual losses from goods being tied up in transit are reported, since all express companies are extremely cautious in accepting freight over any lines that are at all doubtful as regards their ability to forward goods on time.

The stock received in the market continues extremely poor, particularly roses. Am. Beauties, with few exceptions, are cut from young stock and are very short stemmed; these however are the only flowers which meet with any demand at all. As regards summer annuals there is practically no demand.

M. F. Gallagher has turned a full blown soldier these troublous days. With the calling out of the 2d Regiment last week M. F. assumed his duties as quartermaster. If Mr. G. takes as good care of the boys in his regiment as he evidently does of himself, to judge by his portly figure, there will be little room for complaint. There is a story going around, for the truthfulness of which however we cannot vouch, that the quartermaster contemplated the adornment of the mess tables with a bunch of American Beauty roses. The boys in blue, however, vetoed any such proceedings, as in their estimation a good round of beef had more staying qualities than all the posies in Cook County.

Geo. Wittbold has built two new houses 18x21x120 feet long. In addition to this he has moved the World's Fair Carmody-Moninger show greenhouse to his place, where it will be used as a show greenhouse and office.

The plant trade of the present season,

which has just come to a close, has been a rather unsatisfactory one. While some of the growers have sold out pretty clean, others are caught with a large stock of bedding stuff left over. Those who were fortunate enough to sell out pretty clean had to be content with low prices, as sales had to be forced, and as a consequence there was more than the usual amount of cutting in prices. Geraniums out of 4-inch pots set out which in former years brought $2 per dozen for well grown plants were sold this year at from $1.25 to $2, and in many instances as low as $1, with the same corresponding drop all through the list. These low prices are bad enough, but when it comes to carrying over a large surplus besides the result is most discouraging. Some growers take things philosophically and express themselves as being satisfied with the result, considering the times, as they were not looking for a very brisk trade, and so trimmed their sails accordingly. Others again were deceived by the hopeful outlook in the early part of the season, when, owing to the extraordinary warm weather at such an early date, the movement in spring stock commenced with a rush. The sudden check, however, which came immediately after with the change of weather had a most disastrous effect on the trade. Many orders had been filled, beds and vases were planted and the work had to be done over again, and although in most cases through no fault of the florist, the loss in many instances had to be borne by them. When the weather became more settled again the season was pretty well advanced and a number of orders were countermanded.

We visited a number of the leading establishments engaged in this line of business on the south side; all of these places, however, do also a considerable trade in cut flowers at retail. Says Sam'l Muir:

"The spring trade in plants with me was fairly good, and my stock, as can be seen, is sold out pretty clean. Prices lower than last year, and considering that many of the early filled orders had to be planted over again the profits are small. The cut flower trade this season was not nearly as good as last year, notably as regards decorations, the falling off in this line being particularly noticeable."

Mr. John Weston of the Chicago Floral Co. reports plant sales very quiet, and considerable stock is left on hand. This firm carries a large stock of decorative palms and plants, and a fairly good business was done last season, but not as good in comparison as former years. There is quite a stock of chrysanthemums grown here and the plants, some of which will be exhibited at the coming show, are growing well. Here by the way we saw a house of Edna Craig carnation still in good condition. Mr. Weston speaks very enthusiastically of this sort, as his experience with it last winter was very satisfactory, and he intends growing it again this year.

Mr. Hulmers of the Art Floral Co. expresses himself as satisfied with the spring plant trade. The houses are pretty well emptied, but prices realized were considerably below former years. This house also does quite an extensive business in cut flowers and decorations. Business in this line also is reported as having been fairly good, though somewhat less than last season. Orders for decoration here, as elsewhere, show a decided falling off. The sale of palms and other high priced pot plants, of which this firm carries a fine stock, is also reported as extremely light. Plants in bloom on the other hand, such as azaleas, genistas, etc., sold well.

[Reproduced from London Punch.]

THE ORCHID IN CARICATURE.

J. T. Anthony's foreman complains of the dull bedding season. This house had an unusually fine stock, but quite a large lot is left unsold. Cut flower and decoration demand extremely light. Orchids, especially cattleyas, of which this establishment makes a specialty, sold pretty well. We note a dozen or twenty very fine blooms of Cattleya Mossiæ ready to cut.

E. Hobbs tells the same story—plant trade quiet, with low prices. Flower trade less in volume than formerly.

J. Kidwell expresses himself as satisfied with the season, although the plant business proved somewhat lighter than formerly. In the flower line Mr. K. has a large trade in funeral work, which has kept him busy most of the time. We note some very fine pelargoniums here; the plants are exceedingly well done and seem to take well.

The store men located in this section of the city, which contains probably the largest number of heavy flower buyers, have experienced the same depression in business as those down town; in fact as these houses depend largely on orders for decorations and the sale of first-class cut flowers they feel the effects of a marked decrease in demand in these lines most keenly. Wm. Smyth says: "Business up to Christmas was by far the dullest I have experienced since entering business. After that, however, for three or four months trade was good, but orders for decorations were very limited and generally cut down to the lowest notch in price."

Chas. Samuelson reports business fairly satisfactory, but complains of the cutting in prices. Good demand for A-1 quality in all grades of flowers except bulbous stock, which was very slow. Table decorations, which form an important item at this establishment, were not extensive, and instead of a steady increase, as formerly experienced, show a falling off.

Klunder's experience was nearly the same; a deplorable falling off in extensive decorations for receptions and weddings is especially noticeable, and the same is true of table work. The demand for high grade stock in cut flowers very good. "First-class Beauties," says Mr. Klunder, "Testouts, Meteors, Bridesmaids and La France I find always in good demand, and the former especially so. Fancy carnations also sell well and at good prices, but medium quality stock in this locality sells very slowly, and poor stock has no show whatever. There was little call for spring flowers this year. It seems the society season this year came to a close at a very early date, many of our best flower buyers starting for Europe and other points as early as April."

The Orchid in Caricature.

The accompanying engraving, reproduced from London *Punch*, appeared in that journal with the title "Interesting development of the 'Josephus Cubicularius' Orchidensis."

Most of our readers have heard of Mr. Joseph Chamberlain, the well known lover of orchids, and who has been popularly dubbed "Orchid Joe" from his habit of always wearing an orchid flower in his button hole. Mr. Chamberlain is a member of the British Parliament and prominent in politics, and his fondness for orchids evidently suggested the use of these flowers in the cartoon. His great wealth was acquired from the manufacture of screws, which explains the meaning of the flower in the lower left hand corner.

We are indebted to Mr. A. Dimmock for the copy of *Punch* from which the engraving is reproduced.

Cincinnati.

Again we report the same old chestnut, "dull." That little word expresses much. Think of people ordering wedding hand bouquets and wanting to pay 15 cents for the best two and 10 cents for the balance. This actually occurred at an "over

The Leedsii section in bloom. *Daffodils in the grass.*
General view of a section. *Orinatus in flower.*

VIEWS ON MR. W. BAYLOR HARTLAND'S DAFFODIL FARM NEAR CORK, IRELAND.

the Rhine" store one day this week. Fred nearly fainted when the ladies named the price.

Albert McCullough and daughter returned home from Europe July 5. Report rather a rough voyage, but as both were good sailors they did not miss any meals. Mr. McCullough reports heavy rains all through England and Holland, and prospects not flattering.

The 4th of July passed off quite noiselessly, Geo. Meyers, with Walter J. Gray, being the only florist who thought his hand stronger than a cannon cracker. The damage might be worse, but George will not try the experiment again.

Our florists are having considerable trouble with asters. The plants look healthy until they commence to show bloom, when they turn brown and die.

Henry Schwartz is building a new greenhouse 15x60 feet. This makes four houses of this size in his plant in connection with his office and shed 11x26 feet. He has been in the business 3 years, and reports a good trade.

The retail florists in general seem to think their trade for June was better this than last year.

W. C. Nolan of East Walnut Hills is building a greenhouse 15x75 feet; this makes 7 houses in his plant. W. C. reports trade considerably better than last year. He has had quite a lot of bedding for the city water works around their buildings.

M. Rice of Marschuetz & Co., Philadelphia, is in the city stocking the boys up with florists' supplies.

Miss Honaker of Lexington, Ky., made us a short call on her way to Ft. Wayne.

We now have good rates to Atlantic City and will have quite a party from here. All neighboring florists wishing to join our party will address E. G. Gillett, 134 Walnut street, as early as possible. He will give rates and other particulars.

Our first annual picnic is progressing splendidly, and if we have a favorable day will have a crowd. July 26 is the date and at Woodsdale Island. All our friends are invited. G.

St. Paul, Minn.

We have had a continuous drought for eight weeks, broken slightly by two or three light showers. In consequence the city is looking dry and barren. In spite of frequent sprinkling plants have gone backward. Florists' stock, however, is generally looking well. Mums were never better than now, roses are looking well, carnations planted out are in fair condition considering the season.

Trade is at a standstill, though there is enough funeral work to use up the supply of cut flowers. In roses some fine La France, Meteor and Kaiserin are being cut. The principal growers have thrown out most of their old stock of roses and are now busily engaged in planting new ones. More roses than usual will be planted this season, and there is a finer stock of mums here than was ever before seen. All this would indicate that our wide awake, hustling brethren have faith in the future trade here.

Some experiments in solid beds are being made this year and quite a number will try Brother Scott's suggestion to use water cement on their benches.

L. L. May & Co. are painting their entire range inside and out, putting in new benches, repairing boilers and later on in the season intend building several new houses.

We have not heard of any who intend to go to Atlantic City next month. We surely hope the saintly city will be represented.

Some of the prettiest plants of the season are the gloxinias now being displayed by A. S. Swanson. He has learned the art of having everything at the right season and with a neat attractive store merits a good trade. FELIX.

OBITUARY.

ROBERT JOHNSTON, the well known florist of Providence, R. I., died June 24, after a lingering illness, aged 65 years. He has suffered for more than a year from rheumatism. He was highly esteemed, not only in a social way, but by those who had business transactions with him.

Toronto.

Replies to the questions asked for in the AMERICAN FLORIST'S spring plant trade report look very blue, but the truth must be told, and there is no earthly advantage to be gained by booming the trade up when there is no boom to it. The total sales were probably from 15 to 25 per cent less than last year, and many florists have a lot of "stuff" left on their hands. What was sold fetched prices below the average, well grown geraniums going for about 75 cents per dozen. Add to all this much difficulty in collecting accounts, and it does not take much perspicacity to see that, taking everything into consideration, the spring trade has *not* been as satisfactory as that of last year—not by a "jug full." Still, in spite of all this there is some little rebuilding going on, and a few new houses are being built. They tell me too that two or three new florists have started here this year. Evidently florists look for good things in the future, and think that "it is a long lane that has no turning." E.

Boston.

The flower stores in these summer days are bathed in an atmosphere of repose and recent cleanliness and furnished mainly with a couple of chairs near the door, with palm leaf fan trimmings and a general suggestion of lemonade and linen duster. Enquire for the proprietor, and you are informed that he has just gone out—time of return indefinite. By unanimous consent all the establishments, wholesale as well as retail, close at 5 p. m. every day excepting Saturday. The beach trade is not making itself felt as yet.

D. Zirngiebel is demolishing four of his old houses, which he will replace with two modern ones, heated of course by his favorite "hot water under pressure."

Foreign Notes.

The Lords of the Treasury on the recommendation of the First Commissioner of Her Majesty's Works and Public Buildings have raised the minimum wage for laborers in the Royal Kew Gardens to 19s. per week. Previous to 1847 the minimum appears to have been only 12s., in that year it was raised to 14s., in 1865 to 15s., in 1873 to 17s., in 1889 to 18s.

From the Kew Bulletin we learn that a fresh survey of the Royal Gardens has been made by the Ordnance Surveys, and it appears that the area in which cultivation is carried on under glass is over 2½ acres and the linear extent of the footpaths exceeds 14 miles.

A writer in the *Journal of Horticulture* says that there is every reason for supposing that the leading Japanese show flowers of 1893 will be practically extinct in 1903. "New and capable raisers are coming into the keenest competition possible with the old ones. Names that were once familiar as eminent growers of seedlings are unheard of now, and whether for better or for worse the best twenty-four Japanese are never likely to remain the same for any length of time while the flower offers so wide a scope for their skill as it does at present. When raisers, other than English can appreciate the merits and quality of the incurved section we may possibly see another revolution in the cultivation of this protean flower."

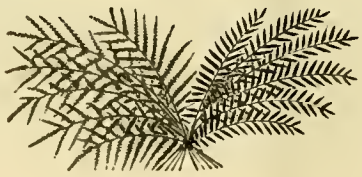
LEAF MOVEMENT IN CERCIS CANADENSIS, by Prof. S. G. Wright of Purdue University, is a recent monograph reprinted from the *Botanical Gazette*. The results of Prof. Wright's researches are given in tabular form, and there are several illustrations.

DO YOU WANT a list of firms in the trade that issue catalogues, with key showing proportion of space given each branch of the trade in same? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

DO YOU WANT a list of the cemeteries of the country that use trees, shrubs and plants largely in the ornamentation of their grounds and that are apt to be large buyers of these and other horticultural supplies? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

THE AMERICAN FLORIST and *Gardening* together to one address for $1.75. Send orders to the American Florist Co.

Not high strung, vain attempts absorbed our powers.
But practical, every day effects, in showing flowers.
No fancy, ill-shaped, or almost impossible arrangements are shown in



Long's Florists' Photographs,

but pictures of every day work, such as you have in mind at any time in waiting on customers. This keeping down to a practical level is what makes them so useful to any florist in his business. Send for catalogue to.

Seed Crop Report from Waterloo, Neb.

Since June 6th we have had bounteous rains and the outlook for a seed crop is much better than at that time. The rains however came too late to secure a good stand of vines of all kinds, but as we are now having some fine growing weather we will without doubt have an average crop. All kinds of vines with the exception of cucumbers are nearly ten days later than they should be, but with continued favorable weather are likely to mature all right.

The acreage devoted to cucumbers is not more than one-fourth that of last season. About the usual acreage has been planted to squash, pumpkins and melons, but the outlook for a heavy crop is not so good as at this time a year ago. There is not likely to be so large a surplus of vine seed this fall as we had in 1893.

Corn is very forward and is looking fine, but the acreage of sweet corn is not quite so large as a year ago. Tomatoes have not done well and the crop will be light. Onion sets will give an average yield with a slightly increased acreage.

Another grower says, July 5: "Crops in general are growing rapidly, weather the past week having been warm and showery. Sweet corn, late sorts, shows a very irregular stand owing to failure to germinate uniformly; it is estimated that 25 per cent of the acreage planted will be too late in maturing to make a good quality of seed. Hail, the night of June 28, destroyed a considerable acreage of cucumber and watermelon."

The Trade Association of London.

The Nursery and Seed Trade Association, limited, of London, publishes the following statement of its objects:

To protect the business of Nurserymen, Florists, and Seedsmen in the United Kingdom and abroad from fraud and losses.

To collect and disseminate information beneficial to Members of the Association and establishment of unity amongst the Trades.

Speedy and economical collection of debts due to Members.

Investigation and arrangement of Bankruptcies and Assignments.

Making trade inquiries, and giving information generally.

One of the special benefits derived from connection with this Association is that its members afford to each other, through the Secretary, mutual private information as to the financial position and character of and the extent of credit which may be safely given to old or intending customers.

The officers are a president, treasurer, three trustees, a committee of twenty-two, and a secretary. There is also a specified solicitor and banker. The president for 1894 is Mr. N. N. Sherwood, of Hurst & Son, 152 Houndsditch, E. C., and the secretary is Mr. G. Worrell, 30 Wood St., Cheapside, E. C.

The annual membership fee is 1 pound 1 shilling for home members and 2 pounds 2 shillings for foreign members.

WM. HENRY MAULE and wife registered in Erfurt June 19.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

News Notes.

NEW ALBANY, IND.—Ben Hains is preparing to start in the business here.

MINNEAPOLIS, MINN.—R. J. Mendenhall is adding about 6,000 feet of new glass.

PORTLAND, ME.—Albert Billings has started in the business at 277 St. John street.

SARATOGA, N. Y.—T. J. Totten has built one new house for American Beauties for summer flowers, 20x75.

TRAVERSE CITY, MICH.—Frank M. Paine will start into business here, beginning with a modern greenhouse 20x50.

RUSHVILLE, IND.—Geo. F. Moore has sold his greenhouses in Milton, Ind., and is now engaged in the business here.

PROVIDENCE, R. I.—John A. Macrae of Smith street, is building one new house 20x200 and is rebuilding two old ones.

COLORADO SPRINGS, COL.—Wm. Clark has built three new houses of which one is 25x160 one 20x100, and one 10x100.

RICHMOND, VA.—J. H. Harvey & Co. have built four new houses 14x75. W. A. Hammond has built two new houses of good size.

BURLINGTON, VT.—W. A. Lee is tearing down one of his houses and building another one of double the capacity to replace it. Fred Dewey is now out of the business. Mrs. M. D. L. Thompson is now the Queen City Floral Co.

MILTON, IND.—Geo. F. Moore has sold his greenhouses to Geo. H. Peet & Son. They are removing the houses to Cambridge, Ind., where they will start in the business. Mr. Moore has removed to Rushville, Ind., where he is beginning business again.

LINCOLN, NEB.—C. H. Frey has sold out his interest in the firm of Frey & Frey to his father, H. H. Frey, and has bought five acres of ground outside the city limits on which he is building nine greenhouses, of which two are rose houses 20x125; two carnation houses 10x125; one general house 20x125; two 10x125 one 8x100 and 12x60. Attached to same will be a sales room 16x20, together with good sized boiler house, potting sheds, etc. The whole plant will be heated by steam.

Misplaced Generosity.

George: "I have been invited to a flower party at the Pinkles's. What's it about?"

Jack: "That's one of the notions new this season. It is a modern form of birthday party. Each guest must send Miss Pinkles a bouquet containing as many flowers as she is years old, and the flowers must have a meaning. Study up on the language of flowers before ordering."

Florist's Boy (a few hours later): "A gentleman left an order for twenty of these flowers, to be sent to the Pinkles with his card."

Florist: "He's one of my best customers. Add eight or ten more for good measure." —*Society Journal.*

DO YOU WANT Mr. Scott's seasonable hints for the year in book form, so that you can refer readily to his suggestions for any week in the year? You will find them in this form in our trade directory and reference book for 1894. Price $2.00.

Prices Lower Than Ever.

THE AMERICAN FLORIST CO.'S

DIRECTORY

AND

REFERENCE BOOK

FOR 1894

CONTAINS THE FOLLOWING:

1. The names and addresses of the Florists, Nurserymen and Seedsmen of the United States and Canada, the exact branch of the business each is engaged in being indicated.
2. A separate list of firms that issue catalogues, the space devoted to each branch of the business in each catalogue being also given.
3. A list of the names and addresses of superintendents of leading parks in the U. S. and Canada.
4. A list of the principal cemeteries of America at which the arts of the landscape gardener and florist are used in beautifying the grounds.
5. A complete, alphabetically arranged list of Roses in commerce in America, with class, habit of growth, date of introduction, name of introducer, and brief, accurate descriptions of the flower of each. Synonyms are also plainly given.
6. A complete, alphabetically arranged list of Chrysanthemums in commerce in America, with class, and brief, accurate description of each. Synonyms are noted and varieties that are very popular with American growers are designated by a star, and this year's introductions by a dagger.
7. A complete, alphabetically arranged list of the Carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each.
8. Seasonable Hints for the year, arranged in weeks, written by Mr. William Scott, and covering every detail of a general florist business. This is decidedly the most valuable contribution to the literature of the trade ever published. It is written in a plain, practical way, by a man who knows what he is talking about.
9. A historical sketch of the Society of American Florists from its organization to date, including officers for each year and lists of essays read at each meeting, with other information of interest.
10. A similar historical sketch of the American Association of Nurserymen.
11. A similar historical sketch of the American Carnation Society.
12. A similar historical sketch of the American Seed Trade Association.
13. Similar historical sketches of the Florists' Hail Association of America; of the National Chrysanthemum Society of America; of the Florists' Telegraph Delivery Association.
14. A complete list of all National and Local Trade Organizations, with names and addresses of principal officers, time and place of meetings, etc.
15. Statistics of Commercial Floriculture in the U. S. from the last census.
16. Statistics of the Nursery Industry in the U. S. from the last census.
17. Statistics of Seed Growing in the U. S. from the last census.
18. A list of Leading Horticultural Societies, with name and address of the Secretary of each.
19. Full information about Express and Postage rates on plants, shrubs, trees, seeds and bulbs

No less than 270 pages of valuable reference matter in compact form, and all UP TO DATE.

News Notes.

HARMAN, COLO.—C. J. Hurt is building 7,000 feet of new glass here.

JUNCTION CITY, KANS.—W. P. Ranson is again in the business here.

YOUNGSTOWN, O.—E. Hippard is rebuilding four houses each 20x100.

RUTHERFORD, N. J.—Mr. Wm. P. Kesteloo, the florist, and Miss Nellie Spects were married June 16.

SPARTA, WIS.—Mr. Nick Greivelding is adding a new house 18x100, upon which he will use 14x20 glass.

DES MOINES, IA.—W. L. Morris is building two rose houses each 20x116, and two violet houses each 11x116.

CHATTANOOGA, TENN.—The Chattanooga Floral Society now has 150 members and will soon give an exhibition.

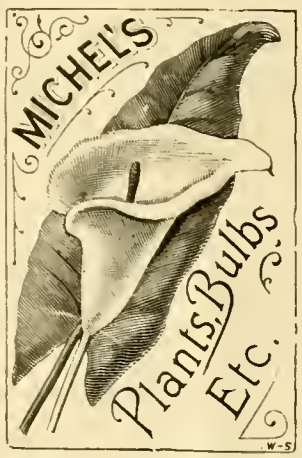
TOLEDO, O.—Mr. Ewald Suder and Miss Ella Suder are taking a vacation in Europe, the latter to pursue her musical studies.

WASHINGTON, D. C.—Henry Holzapfel, Jr. has resigned his position with the World's Fair Bureau of Awards and has returned to his home in Hagerstown, Md.

DAVENPORT, IA.—C. Dannacher is now building one short-span-to-the-south house 200x20, and one 100x20 of the old style. F. L. Bills is building two houses 9x100 and one 100x11.

OTTAWA, CAN.—H. Parks is building a place of his own and his old landlord Mr. A. French takes the old place and will enter the business. Mr. French is now adding two houses each 100x20.

PARKERSBURG, W. VA.—Hail and wind destroyed three to four hundred panes of glass in the greenhouses of Adolph Hiehle recently. This is the first storm of the kind since he has been established there in 1877. He had no insurance.



LANCASTER, PA.—Mr. A. D. Rohrer has retired from the business, having sold out to a new firm, Landis & Co. The new firm is composed of his nephew, Mr. A. K. Rohrer, and Mr. Leaman Landis, both men of long experience in the business.

DENVER, COLO.—Harrison H. Given is now building four rose houses and reglazing fourteen plant houses. C. J. Hurt is building 7,000 feet of new glass at Harman, Colo. J. L. Russell is building 10,000 feet of new glass in this city.

UTICA, N. Y.—P. Riley is building two 100-foot houses. P. Crowe is adding two houses, one 100 feet long and the other 140 feet. J. C. Biglow is building a new 100-foot house. R. Campbell has started in the business on Highland Ave.

TERRE HAUTE, IND.—John G. Heinl intends to build five or six new houses including a show house 70x20. Mr. Heinl has sold his new place to the Cowan Bros., having made arrangements with them to take the cut flowers they grow.

LONG ISLAND CITY, N. Y.—The greenhouses of Theo. Luckner being in the line of a large sewer now being built he has had to take the houses down, being indemnified for the trouble and expense, and he is in doubt as to whether he will rebuild on the old place or seek a new location.

Toads in the Greenhouse.

Your correspondent Mr. H. Goold is quite correct in what he says regarding the toad as an insect exterminator. The late Mr. James Taplin was a great believer in the usefulness of this creature, and always kept a number of them in his houses. When at South Amboy, N. J., years ago, in addition to the toads a large palm house was the home of several turtles and a few pet lizards, all very tame. The turtles were especially fond of worms, while the lizards, with their wonderful activity, made havoc among flies and any other winged insects. One of the lizards had a habit of following Mr. Taplin all over the house, and its death unfortunately resulted from this familiarity, as its master stepped back suddenly one day, unaware that it was at his heels, and crushed the confiding reptile. The toads were particularly useful in the fern houses as slug destroyers; if my memory is correct they didn't fancy sow bugs, but the turtles ate them eagerly. It made the boys very ready to pick up any stray insect they might see on their rounds, because it was amusing to see the reptiles gobble them down. R.

Chicago to Atlantic City.

The Chicago Florist Club has secured a special low rate to the S. A. F. convention at Atlantic City, over the Pennsylvania railroad. Train leaves Chicago at 3 p. m. Sunday, August 19, passing over the Allegheny Mountains in daylight and reaching Atlantic City Monday evening. Florists in the west and northwest who wish to join the party are cordially invited to do so. Berths may be reserved and further information obtained by addressing the chairman of the Chicago Club's committee, Mr. G. L. Grant, 322 Dearborn street, Chicago.

Influence of Colored Light on Plants.

In *Public Opinion* for May 24 appears an article on this subject translated from the French of M. H. Marsan in the *Paris Revue des Revues*. Numerous experiments by French scientists are described and the following table is given as showing the results obtained by M. M. A. Villon.

"Taking as a base the growth under white light, and designating this by 100, we find:

Culture under white glass		100
" "	chrome orange	150
" "	violet with manganese	150
" "	cobalt blue	140
" "	blue from copper	120
" "	silver	60
" "	uranium	40
" "	gold	40
" "	red with protoxide of copper	15
" "	green with protoxide of iron	10

"M. Villon found that the best light is that which passes through the manganese violet, which allows the red light, the violet rays and calorific rays to pass through. Experiments made with flowers have shown that they grow more quickly under the influence of violet and orange color. The shade of violet in which red predominates seems to be most favorable. Red flowers, like the carnations and roses, accommodate themselves best to green light, blue flowers to yellow.

"This science relating to the influence of colors on plants has numerous shades, the discovery of which will doubtless prove a great benefit in the future development of vegetation. For example, according to M. Villon, in their earliest stages, roses develop best under a violet light, but when about to flower a gilden screen through which the green rays cannot pass serves best."

A New Use for Egg Shells.

A correspondent writes us that when visiting a florist in a small town he noted a curious way of treating some seed. This florist had filled a pan with soil into which he had plunged egg shells that had a small hole in the bottom, and these shells were also filled with soil and the seeds planted in the shells. The idea was that he might lift the seedlings without disturbing their roots, when the time came to transfer them to a pot. This elaborate carefulness struck our correspondent as quite humorous and in consequence he writes us a note about it.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

Historical Reminiscences of the Chicago Cut Flower Trade.

BY F. F. BENTHEY.

[*Read before the Chicago Florist Club, June 28, 1894.*]

When we consider the magnitude of the cut flower trade of to-day in this city we can hardly realize the fact that scarcely twenty-seven years have elapsed since the first store for the sale of cut flowers was opened. Previous to that time the sale of cut flowers, mostly in the shape of bouquets, was so limited that scarce any note can be taken of this branch of the business, which has now overshadowed all other lines of floricultural pursuits.

To a Mr. Thomas, according to Mr. John Goode, who came here in 1845, belongs the honor of erecting the first greenhouse about 1835 or 1836, a sketch of which appeared a few years ago in the AMERICAN FLORIST; this was located on the corner of Dearborn avenue and Division street. Then came Samuel Brooks, who erected a small structure; a lean-to 12x50, corner Adams and Clark streets. Martin Lewis followed in 1850 or 1851, with a house of the same dimensions, but this was closed again, not paying expenses, until 1862, when August Dressel took hold, under whose able management the place flourished for many years; it is now owned by Mr. S. J. Pearce. This establishment was called the Sheffield Nurseries, nursery stock being its principal feature and was for a while in charge of the well known horticulturist John Goode, who later on formed a partnership with Andrew McAdams under the firm name of John Goode & Co.

In 1854 Archibald Williams built a small house 10x30 at Fullerton and Southport avenues, afterwards removing to Clark and North avenue, associated with Geo. Wittbold, now at 1708 N. Halsted street. The same year (1854) Job Carpenter built a 50-foot house on Lake street opposite Union Park, and this concluded the list of commercial greenhouses up to 1857. At this time the population of Chicago was about 75,000. Chas. Reissig, who in after years became a well known figure in the flower business, was then still in the boiler business. Although having built a greenhouse in 1853, he did not engage in the sale of flowers until a few years later.

In the summer of 1857 Edgar Sanders built a lean-to south of his cottage; this was the beginning of an establishment which a few years later became one of the principal and best known houses in the city. It was called the Lake View flower gardens and was located on Evanston avenue and Belmont avenue. To Mr. Sanders we are indebted for much valuable information relating to the early history of the trade. In fact all the notes up to and including the year 1868 are taken from his memoranda.

Several other men who afterwards became well known started about this time, Wm. Brooker in 1859, Sulzer Bros. in 1860 and Adam Blumenschein in 1861. The latter continued in business where he first started, Cottage Grove avenue and 29th street, for many years. Like a great many others Mr. Blumenschein came here a very poor man, a fact of which he was never ashamed in later years, being then well to do; he used to point out with pride the identical spot where he dug ditches in working out his poll tax of $2, being too poor to pay the money.

In 1866 we find eighteen establishments in existence with a total of twenty one greenhouses, two of them graperies, the whole containing about 25,000 feet of glass. Compare this figure with some of our modern establishments, say that of Reinberg Bros. with a total of 225,000 feet of glass, or Bassett & Washburn with 150,000 feet. Among others that we have not mentioned yet were Samuel Muir 1865, Robert Pouley 1866, and Pettigrew & Reid on North avenue opposite Lincoln Park, then a cemetery.

Up to this time little or no attention was paid to the growing of cut flowers. Although Edgar Sanders opened a store in 1859, this place was intended only for the sale of plants and shrubs during the spring months. But the spring of '67, Mr. Sanders opened a permanent store for the sale of flowers in the basement of 56 Clark street, and the same year Mr. Chas. Reissig opened for business, occupying part of the basement at La Salle and Madison streets. Then followed Gordon Bros., now of New York, Chas. Krueger, who had a store on Lake street, old "Doc" Farrell, Dearborn and Madison, Sam'l Muir on Lake street, and Desmond & McCormick.

The business meanwhile was steadily growing, but although the demand for cut flowers in every shape was constantly on the increase very few growers gave much of their attention to their produce. The stock as carried by the store men in winter consisted of camellias, which in those days were shipped in by Dryburg of Philadelphia, double and single primulas, heliotrope, abutilons, fuchsia blossoms, perhaps a few short carnations, stevia, eupatorium, etc. Roses were of course an unknown quantity. Here and there you might see a Safrano or Isabella Sprunt with stem two or three inches long. These were indeed a luxury, but to cut them with a leaf on the stem was considered a wantonness of which no grower who understood his business was supposed to be guilty. Gordon Bros. were the first to import roses from the east, New York, in 1869. These roses, Bon Silene and Safrano, though not cut with quite as long stems as we see roses now-a-days opened the eyes of our local men. The price paid them was from 10 to 15 cents, but the question that was debated by the grower was "will it pay to grow them?" The men of to-day may smile

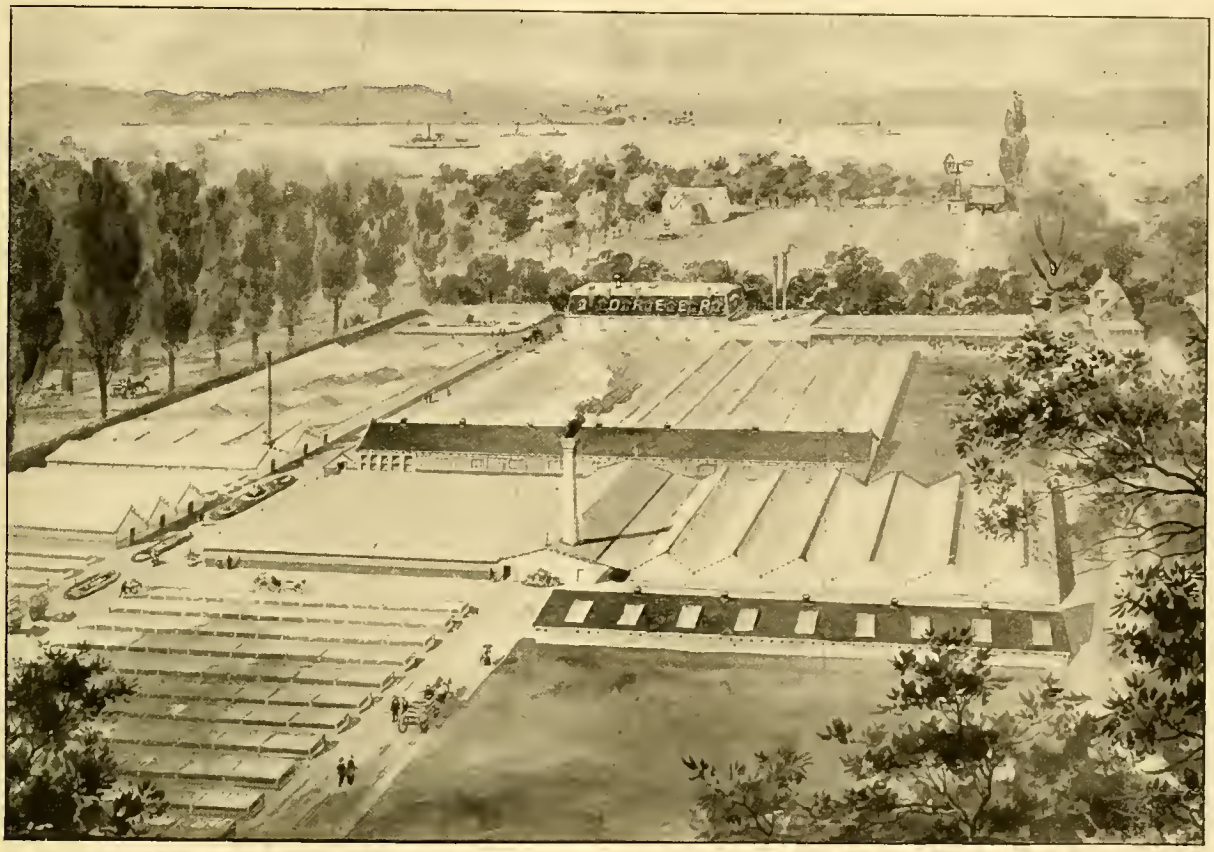
when they hear this, but then the art of growing roses was not reduced to a science, and we know that the first men who started to grow roses in winter did *not* make it pay.

But now came the great fire of 1871, which burnt out every flower store as well as destroying the growing establishments located on the north side. For a while an impression seemed to prevail that for a few years at least there would be small need of a flower store. This, however, proved to be a mistake. Many of us who were connected with the business at that time will remember the boom that followed, commencing the winter after the great conflagration. Our home supply was altogether inadequate for the constantly increasing demand; as yet none of our local growers had made a success of growing roses, and all of the men doing business drew their supply from the east, mainly Boston. Bon Silene became a standard first-class rose, which was known as the "Boston bud." Towards the spring of the year an occasional crop of Marechal Niel and Lamarque would make a sensation, and royal good Niels were grown too. Sulzer Bros. had a fine old plant covering the roof of one of their houses which was magnificent. Chas. Reissig also grew fine specimens. Carnations came into regular supply, though at first in limited quantities, in the early seventies; De Graw for white, and La Purite for color, were the leading varieties. Louis Morey of Oak Park and Miller & Hunt of Lake View were among the successful growers of this flower, which sold in the winter season at from 3 to 5 cents each; all short stems of course. Do you remember the times we had in obtaining a few dozen blooms with stems four or five inches long? If ever time was money that was when time must have counted heavily, for our friend Geo. Miller, who did the marketing for Miller & Hunt in those days, always made the plea when appealed to for a few long stemmed flowers, that it took too much time in picking. A man could go over the beds and snatch off the blooms without stem in much less time, and as for bunching them why that was altogether too rich.

Well, in those good old times the grower had no need of peddling his stock. The boys were up and around long before daybreak on a cold winter morning knocking the grower out of bed. If the grower would only let the retail boys have his flowers at his own price the latter were only too glad to assist in the picking. "But" says George on one occasion when we volunteered our assistance in picking carnations "you fellows are always after long stemmed flowers, now you be careful and don't pick any buds. You also want to look out where you see a new break of wood on the stem, it is possible that also might develop a bud."

In those days we were in the employ of Jas. Farrell, well, Jim had sent us with special instructions to bring fifty long-stemmed flowers. We hunted diligently all over the bed for the required number, but couldn't make it without sacrificing a few buds, so here goes, buds and all, for George has his back turned. Carefully removing the telltale buds we deposited them in our mouth for safe hiding when all of a sudden we are seized with a cough, just then George must needs look around and—well after that our friend kept his eye on us pretty closely and generally found time to gather the long stemmed flowers himself, if so disposed.

In 1874 Sticlow and Kuske came to Chicago from Boston, selecting Niles Center, which has since become noted as a cut flower producing center, for an establishment for growing roses and other cut flowers for the retail market. The venture was a success from the start. The roses grown by this firm, principally Bon Silenes, were fully as good as anything we ever saw imported from the east. The roses were grown in solid beds, as at that time the shallow benches had not been tried yet anywhere as far as we know. The success of this firm soon led many others to follow their example.



Gradually new varieties were introduced, at least some of them new to us, as for instance, Perle, Mermet, Cook and a little later Bride and La France. The first successful grower of these varieties excepting the two latter, which were not out at that time, was Mr. Roper, who managed the McCormick establishment at Lake Forest. This place started up in 1881 with the then new system of growing on benches in three and four inches of soil. This new experiment was soon followed by one establishment after the other, some returning to the solid bed again after a few years' trial.

But let us return again to the retail end of the trade. After the great fire of 1871 some of the very first to start up again were old "Doc" Farrell, (W. D.), who built a little brick shanty on the ruins near the southern limit of destruction on Wabash avenue near Harrison street, and Chas. Reissig, Wabash avenue and 16th street, Desmond and McCormick a little later, and Sam'l Muir on Congress street. About this time Jas. Farrell, who afterwards became well known in the trade, came here from New York. To him belongs the honor of introducing in this city the loose style of bouquet and basket, for at that period this style of arrangement was entirely unknown in our city. We, who entered the ranks of flower workers at about the same time, brought with us from Germany a conception of a bouquet that might have been acceptable to the flower patrons of the fatherland, but it was certainly not in harmony with the taste then developing, and we are free to admit that we are indebted for many valuable ideas to this artist in arrangement. So far as natural and graceful arrangement was concerned the late Jas. Farrell had probably no superior. The only fault sometimes observed would be a glaring defect in color harmony.

Speaking of loose arrangements many of us will remember Aug. Gutzloe, who started a store, we think, as early as '70 or '71 on West Madison street, where for a number of years he did a thriving business. Mr. Gutzloe had an inimitable way of his own of fashioning a bouquet, which to judge by his success appeared to be acceptable to his patrons. Well, Mr. Gutzloe called the loose arrangements a "hoosier" bouquet such as any blank fool could make "but look at this," he used to say, holding up a bunch with the grace of a Dutch cabbage, "there is work for you!" After a while Mr. Gutzloe determined to show the "hoosiers" downtown what he could do, so he rented a store in the Palmer House block on State street. We don't remember just how long he remained but long before his year's lease expired the unfeeling landlord, being unable to collect his rent, had his minions remove Mr. G.'s goods and chattels unceremoniously onto the sidewalk. But still the "hoosier" bouquet prospered.

Dick Watson was another well known character in the business. Dick was a fair maker-up and a first-class salesman. While in the employ of the late W. D. Allen, Dick did the best business in our city. His efforts and ability were largely instrumental in helping to develop the trade. Speaking of Watson we are always reminded of Alex. Burkhart, who, though not a florist but an artist in his own calling, that of wire designs, was so closely connected with our trade that he was always considered one of the craft. Watson and Burkhart were fast friends—generally—only Watson had to be careful touching Alex.'s ability as a workman. One day Mr. B. brought into Allen's store an intricate wire design which had been ordered by Watson and upon which Mr. B. had exercised his genius. But Dick couldn't see the fine points; there was something wrong here, and the wire not bent correctly there. "Let me show you how to fix the thing," suddenly yells Burkhart. Snatching up the wire design he threw it on the floor and jumped on it with both feet, then picking it up hurled it at the head of the astonished Watson. Well, yes, the wireworkers too were in those days more independent than to-day. For those were the glorious days of the gates ajar, the broken column, faith, hope and charity, and all the other designs for funeral purposes. It was a cold day indeed when the florists didn't have from three to a dozen funeral pieces, and the wire-maker was collecting his tribute in a way that would turn the wire artist of to-day green with envy. Then there are doing business to-day a number of the boys who were mere kids in those days, Joe Curran, Walter Kreitling, Phil Hauswirth and others all having made their mark since.

For many years the importation of stock from eastern points had to be kept up, in spite of the fact that great numbers of establishments sprang up on every hand and the older places added new houses continually. Not roses alone but almost every other variety of flowers were sent in. Prices? Well the boys in the east knew how to charge. At any rate the goods sent to Chicago were never billed at cut rates. But business was brisk and retail prices good so there was little complaining. Up to 1882, the grower did his own marketing, which had its good as well as its bad side. One of the good points being that prices then were never subject to sudden fluctuations. Prices would gradually rise in the fall, reaching high water mark in mid-winter and then as gradually downward again. One of the bad features on the other hand was the great difficulty for the dealer in obtaining certain kinds or large numbers of the same from the grower he was dealing with. Times became right for a change and the commission man made his appearance, J. C. Vaughan being the first to embark in this enterprise in 1882, in connection with florists' supplies, etc. This firm rapidly developed a considerable shipping trade, home demand being a secondary consideration. Two years later Kennicott Bros. opened a little two by four joint at 24 Washington street in the basement. Our genial Flint managed affairs in such a way that the business soon outgrew its very limited quarters. This concern was in fact the first commission house pure and simple, depending on a commission on sales for a living. At first this house entered exclusively to the local market but gradually working up a fine shipping trade as well. And now at the present day we have nine regular commission firms and one large wholesale house selling its own produce, who handle the product of hundreds of growers aggregating last year the sum of half a million dollars. Much has been said against the commission house feature, but one thing is certain that these commission houses

VIEW OF THE GREENHOUSES OF H. A. DREER AT RIVERTON, N. J.

have done a great deal in developing the flower business. If they had never been in existence there is no question but what the business would have kept on growing, but the rapidity with which we have advanced is largely owing to them.

Abuses may have crept into the management with more or less detrimental effect on the business, as for instance, the abnormal advance in prices at the holidays. But these objectionable features can be and should be eradicated. Already the commission dealer has found out that extreme high prices on special occasions are hurtful to the trade. So this matter is being rapidly adjusted to the satisfaction of grower, dealer and middleman. Then there is the fakir, also the outgrowth of the wholesale system. How to deal with him is a question for the future to decide. Less than two years ago the Chicago Cut Flower Exchange was started with the hope that it would do away with all the objectionable practices of the commission business. Naturally the projectors of this new enterprise expected the loyal support of the growers as undoubtedly the advantages to be gained by them were larger than those of the other interests. But how lamentable the failure is a matter of very recent history, the very growers who were loudest in their complaints against the commission dealer, calling him a thief and a cut-throat, proved the very ones to hold back, expecting his brother grower to draw the chestnuts out of the fire. If the undertaking had proved a success they were ready to tumble into the band wagon, but now, "well I told you so." Other cities have made these exchanges a grand success, why not Chicago? There is apparently too much narrow minded selfishness and jealousy in our ranks and until this is shaken off there is small hope for unity of action.

As an outgrowth of the times which points to combination of kindred interests in every direction there is now a movement on foot for the purpose of organizing the commission and wholesale interests. We think this move a wise one but no permanent good can result from it unless the other two divisions also organize for a similar purpose. Let the retail men form a union, not for the purpose of antagonizing either the wholesale interest nor the grower, but in order to enable them to take a firm stand against certain abuses wherever they exist, the correction of which can be accomplished only by united action. The growers of cut flowers should do the same. With all three divisions thoroughly organized all matters of grievance could readily be adjusted by a joint board of arbitration. Some such move seems necessary, particularly at times when trade is so often and frequently needlessly disturbed by conflicting interests. But this subject is in our estimation of such vast importance that it deserves a broad and full discussion.

We have already trespassed on your patience to such an extent that it seems an imposition to ask your indulgence for a few minutes longer, but we cannot refrain from touching upon another point which is of the very greatest importance to horticultural and floricultural interests, and that is the necessity of a horticultural hall for holding exhibitions as well as providing a comfortable and proper home for our Horticultural Society, the Florist Club and all kindred interests. The time is right for such a move. Mr. G. L. Grant in his address before the Club at our last meeting strikes the keynote when he says: "We all love our city and wish to see it beautiful and healthful. Let us take steps towards the creation of a commission which shall have power to plant and maintain shade trees on every street possible. The city of Washington has already done this and as a result Washington is famous the world over for its beautiful trees. We can do the same here. To be sure it will take work to carry such a measure through our city council, and still more work to insure the appointment of proper men on the commission, but it can be done. We would surely have the active support of the daily press and by persistent effort all obstacles could certainly be overcome."

Just now seems a most opportune time for accomplishing the desired result since the often debated plan of converting the unsightly Lake Front into a beautiful park is again brought to the front. One of our ablest aldermen, Mr. Madden, has already submitted a plan for such a park, "Madden's mad dream" some people call it. A dream it may appear though a beautiful one, but mad it is not. It is simply a question of time before it will become a reality. But can we, as an organized body of horticulturists stand idly by without an attempt to further the best interests of such a move? And furthermore, here is our very chance. Before a permanent plan is adopted the horticultural hall should be made part of it. Don't let us wait until the matter has assumed permanent shape and plans are approved when difficulties might be en-

countered as to its location. If energetically pushed *now*, we think that our chances of obtaining the desired site for the building are very good. Of course the necessary funds for the building must be provided. On this score too we should have no difficulty. There are plenty of public spirited men of means in our city who take an interest in horticultural matters and would be willing to subscribe liberally for such a cause. In connection with the hall, suitable conservatories might be built by the park commission. But all these points should be thoroughly discussed in the near future and then as soon as the line for action has been determined let us all work heart and soul together according to the old maxim "In union there is strength."

A Holland Bulb Farm.

We present herewith a view on the bulb farms of Messrs. Segers Bros., Lisse, Haarlem, Holland. As will be noted the fields are intersected by numerous canals which are used not only for irrigating but for conveying by boat manure to the grounds and the bulbs to the dry houses, etc. The soil in which the bulbs are grown is almost pure sand, and all the work of cultivation is done by hand. We are told that the water in the canals is kept always at a level just two feet below that of the field, and that by this means the soil in the field is maintained at an exact degree of moisture all through the season. Also that owing to this system, even in the middle of the summer lettuce or cabbage may be planted in the fields without failures.

Our Telephone.

Hello, there; is that Wood's Hole, Mass?

No, sir; ring off.

Why, who are you, anyhow?

This is Wood's Holl; not Hole.

Well, the Post Office department says it's Hole.

What of it. We call it Holl down here; Holl's right.

Very well. Please call Mr. Walsh to the telephone.

Oh! the man that grows those handsome roses. Line connected. There he is.

Hello, is that you, Mr. Walsh?

Yes, what's wanted?

This is the AMERICAN FLORIST. We see by the account of the Boston rose show that you have been capturing the prizes up there again. Cannot you tell us how you manage it.

Oh, there's no great secret in it. We just take good care of them, that's all. When your growers want to force roses indoors successfully they see that the plants are fed when they need nutriment and watered when they need moisture. The same attention given to outdoor roses will result in the same success.

Supposing you give us the names of a few of the varieties which in your experience have proved the most satisfactory.

Well, I have just been admiring a plant of Her Majesty which has thrown from two branches twenty-three grand blooms and this notwithstanding it suffered severely from that sudden freeze we had last April. This rose has been frequently condemned on account of the supposed difficulty in growing and blooming it. My plan is to bend the canes over and tie them down, and it gives me a flower from every joint. I think that growers make a great mistake in pruning this rose. Take the tip off, if you please, but that's all.

I wish you could see my Brunners, there are over forty blooms on a plant in many cases. If only this rose was a little more double and did not show the center so soon; like its progeny, Columbia, for instance. A cross between these two ought to be a good one. By the way, I wish some one would tell me why Brunner come striped and mottled at times.

I have noticed in the Boston shows that they don't get the substance in their Luizets that they should. This rose comes very fine here. The plants are a perfect sheet of bloom, averaging from thirty-five to fifty flowers each.

What are your observations on the newer roses?

Among recent introductions one of the best is Margaret Dickson. It has proved all that was claimed for it. Marchioness of Londonderry is a new one of '92 similar in color to Margaret Dickson, and a very good rose. It is more double than Margaret Dickson. I don't know that it is any improvement on that variety though, so far as I can judge by its first season of flowering.

Spenser, introduced in '92, I would call an improved Baroness Rothschild, the foliage is well up under the flower and the color as good as in Baroness, but the flower is as double as Merveille de Lyon which is a strong point in its favor. Gustave Piganeau is a remarkably fine flower. Although the plant is a very small grower the bloom is of the largest size. The whole strength of the plant seems to go into the flower. Captain Haywood I don't think is as good as Piganeau. It is not double enough to please me.

Charles Gater is a new one of '93. It is a great grower. The flower is of a very distinct shade of crimson, has a good make-up and is of immense size. Lady Helen Stewart is another beautifully finished bloom. It is one of the very best exhibition roses we have, I think.

Paul's Early Blush is a rose of most symmetrical form, beautifully colored and free flowering. Earl of Dufferin is of grand color and form but fades early. Marchioness of Dufferin is perfect in form and very prolific. In Sultan of Zanzibar we have a fine dark rose. It attracted great attention at the show.

Margaret Boudet, introduced eight years ago from France is a rose I think very well of. It is an exceedingly floriferous variety, a pleasing pale pink in color, but not as hardy as I would like. A singular fact in connection with this rose is that it has never, so far as I know, been offered in a catalogue since its first year.

A rose but little grown as yet in this country is Victor Hugo, although it is ten years since its introduction. It is one of the brightest colored roses we have, almost scarlet, finer than Lord Macauley in this respect although not quite so double and lacking the great substance of that variety. Gloire de Margottin and Mrs. Harkness, both comparatively new, are beautiful in color and form. Rodocanachi is particularly brilliant and is already becoming a general favorite.

Many of the old varieties are still worthy to stand at the very top of the list. Merveille de Lyon, Baron de Bonstettin, Prince Arthur, Thos. Mills, Mons. E. Y. Teas, Marie Baumann, Pere Notting, Fisher Holmes, Mme. Marie Finger, A. K. Williams, Prince de Portia, Alfred, Duke of Teck and Marquise de Castellane are all grand old sorts and indispensable as exhibition roses. I have a specimen of Marquise de Castellane with twenty flowers on two stems, and all good exhibition blooms too. Duke of Teck is a rose of great substance and nothing can compete with its magnificent glowing red. It would be a good color to fertilize from.

Mme. Annie Wood, although one of the most perfectly formed roses that we have, very free, with superb color and of great substance, is for some reason or other not much grown. Another rose that deserves to be grown much more extensively than it is, is Mlle. Marie Rady. It is very similar to Alfred Colomb only a little more vermilion when first opened. It is of grand make-up and holds its form even when fully expanded. Horace Vernet is another variety we do not see much of. Though not always reliable, nevertheless it has many times carried the challenge cup for exhibition blooms in London and Paris.

Do you do much with roses outside, other than the hybrid remontants?

Yes, most of the teas and hybrid teas do well. Mme. Caroline Testout is an exceedingly strong grower and has proved entirely hardy here. Plants imported in December and set out immediately stood the winter all right. Lady Henry Grosvenor, a new hybrid tea of 1892 with color similar to Souvenir de Malmaison seems to be a good free flowering variety.

Of the older sorts Mme. Hippolyte Jamain, Reine Maria Henriette and Captain Christy are very valuable. Capt. Christy in some seasons is apt to come quartered, but this year it has been very perfect. And Gloire de Dijon I regard as one of the most satisfactory roses we have. We cut more blooms from it than from any other variety.

By the way, there is a new Moss of '93, Zenobia, that is most promising. It resembles Luizet in form and color, with color a trifle deeper; and Paul's Crimson Globe, another introduction of '93 is undoubtedly the largest and best of all the Moss roses. Mrs. Paul, Bourbon, the Gold Medal rose of 1891, is a beautiful soft blush, not so large as some but perfect in form and most satisfactory.

We understand that your seedling, Michael H. Walsh, created quite a sensation at the Boston exhibition. Are you doing much now in the line of hybridizing?

Not a great deal; my facilities for such work are not of the best. I have a good cross from Marquise de Castellane fertilized by Mme. Gabriel Luizet. The color is unique, shading from the b illiant Castellane tint in the center to almost white at the tips of the petals when fully expanded. Another one is a cross between Brunner and Prince Camille de Rohan. It is quite double, very fragrant and considerably darker in shade than Brunner. From Margaret Dickson fertilized with Mme. Hoste I have got a fine pure white variety, full double, with habit and free flowering qualities of Hoste and the vigor and foliage of Dickson. Those are all I can mention specially at present. There are others but we have got to wait another year for them yet.

Do you protect your roses much in winter?

A mulching of straw litter or pine needles; that is all.

How do you dispose of the rose chafers?

VIEW ON ONE OF SEGERS BROS'. BULB FARMS, LISSE, HOLLAND.

We do nothing except to hand pick them. Have tried hellebore but it doesn't have any effect. Paris green I am afraid to use.

Roses in Summer.

During the hot spell roses require a good deal of attention to keep them moving in good shape to get a good strong growth for winter. In this part of the country the replanting is about finished; in the west according to my own observation, they are much later than in the east, where early planting is the rule, for experience has taught us that if we do not get a good growth on the plants by November we can not get good paying crops by the holidays. One reason is that we do not get near as much bright growing weather in the fall as we used to, therefore we must take advantage of the summer to get the growth.

When the house is planted shade with white wash, give all the air possible, and do not let it dry up too much. Syringe twice a day, and keep the house moist by damping the walks down. Do not get the soil in the benches too wet, and especially in damp humid weather look out for the soil and do not let it become wet enough to get covered with scum or moss. At times now we get cool nights; do not leave all the air on, but reduce it in proportion to the fall of temperature, for it is just as easy to get an attack of mildew now as it is in the fall. When you see a speck of mildew kill it by an application of sulphur or fostite; both are sure cures, but I prefer the latter, as it is much more economical.

In muggy weather at this time of year you are apt to get an attack of green fly, but close up the house after sundown and fumigate it, opening the house two or three hours afterwards, and you will do the plants no harm. However, unless it is exceptionally cool, it is apt to injure the plants if the house is left closed all night.

Where old plants are carried over it is as well to begin to let up on the water now, so as to dry off to some extent before pruning, but it is not advisable to prune yet, or the plants being denuded of foliage to some extent by the cutting back are apt to suffer from the sun striking on the unprotected wood. While I am not an advocate of carrying roses over, still in some cases it is necessary to do so, or where the plants are grown in solid beds, as seems to be done in the west to a great extent, I do not myself believe that it pays to grow roses the second season; work them for all they are worth, and you will find when they are grown on a bench their strength and all the substance in the soil is exhausted in one season.

For summer blooming there is no white rose that can beat Kaiserin Augusta Victoria whether carried over or planted early. I saw a house of this rose that had been planted early in the present spring by L. L. May & Co., St. Paul, Minn., and at the time I saw it (June 2) was a picture of health and vigor, just beginning to come into bloom; the flowers were large and foliage perfect. It was just the house a rose grower likes to see, and unless signs fail will cut heavily all summer.

Perle des Jardins is as we all know a first-class summer rose; in fact I think it is much more useful in summer than in winter. La France is the best pink rose we have for summer; two year plants of it doing best. Mermet and Bridesmaid come too small to be of much value in hot weather. Niphetos, if shaded, do well in summer although the flowers are soft. American Belle is very good at this season if planted early; what it would do if carried over I cannot say, as I have never seen a house of it the second season. Last season I saw it in summer at J. Burton's, Philadelphia, and the flowers were fine and of good substauce; I was much impressed by its value as an all the year around rose then. In the vicinity of New York Beauty is not much thought of for summer or early fall, but W. Scott grows it for this season by planting early, and grows it well too; if it did not pay for the treatment and that well W. S. would not try the experiment twice.

Do not let your young roses flower now; keep the buds pinched off, and let the plants gain strength before allowing them to bloom. Those planted in May should not be allowed to develop flowers before the first week in September; that is up to that time keep the buds pinched off. As soon as the plants are large enough stake and tie, and be sure to keep the surface of the soil free from weeds and moss. Give it a rubbing over or stirring with the fingers at least once a week. If your soil is very light or the plants growing very rapidly it is a good plan to put on a very light mulch of well decayed manure, not so much as a stimulant as a preventive of evaporation, and to keep the soil cooler at the roots, but this is not often necessary.

JAS. S. TAPLIN.

Hackensack, N. J.

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

Chrysanthemum Notes.

The plants are now beginning to make a strong growth and should be closely looked after every day. They will probably need watering every bright morning, and during such torrid weather as we in the vicinity of Boston are now afflicted with, will require a syringing during the day. Take advantage of any cloudy day to weed the beds thoroughly and if the soil has become sour in any spots, or shows any fungous growth, stir the top a little and let the air in to sweeten it, and if very sour sprinkle a little charcoal dust over the bench.

The next thing that will require attention is the staking and tying up, and this is done in almost as many different ways as there are growers, some using sticks, others wires, and others cord. If the plants are grown to single stem and flower the best way to tie them up is to place a stick or large wire to each plant, but if there is only four inches of soil in the bench the stick will need to be fastened at the top or before the season is half finished the weight of the plant will swing the stick to one side or the other and then the plants will grow crooked. Where a stick is used to each plant the best way that we know of is to adopt the system now in vogue by most of the rose growers, that is to run a wire (size 18) the length of the bench, drawn as taut as possible nearly as high above the beach as the sticks are long and tie the sticks to it. If it is more convenient to run the wires across the bench a stick can be fastened to each side of the bench at the end of the rows and a wire run from one stick to the other and the intervening sticks fastened to it in the same manner as the others.

If the plants are grown to two or more blooms it is not so easy to have a stick to each shoot as in the single stem system and we think they are much easier tied up to strings in much the same manner as smilax or asparagus is grown. The top wire may be arranged in the way as described above, where sticks are used, but if the taller growing varieties were planted at one end of the house raise the wire at that end so that it will be about six inches below the average height of the tallest variety. This can be easily arranged if the rows run across the benches and we prefer this way. We fasten a strong stick to each side of the bench on the inside of the board by a staple three inches each side of the row of plants and run the wire across the top of the sticks. The wire at the bottom should be strung at least eight or ten inches above the bench, this gives plenty of room to reach in and do what weeding may be necessary and to put on a little top dressing later if it may be desirable. We believe this way to be far preferable to two rows of sticks for it gives the grower a great deal more room to get at the roots of the plants.

Be sure and make a good examination of all the plants every day, if possible make it a part of your system to go through the houses every day about such a time and carefully look into anything that may be out of the way. As the plants grow, if by mistake any plant has got set out in the patch of any other variety, it will be easily discovered, and put a tag down beside of it now, and make a note of it, and when it blooms either pull it out or write the correct name on the tag. If by an accident a plant or shoot should be broken or become stopped in any other way tie a tag to it and write a number on it and if you are going to keep a book put it down, for it may produce the best bloom in the house and many of us have found out how to grow many a plant better than we knew before by accident. These things may at first sight appear to amount to but little, but when you come to compete against a number of good growers, an extra fine bloom of any variety will often carry the prize to the competitor exhibiting it.

W. Newton, Mass. ELIJAH A. WOOD.

Chrysanthemum Judging in America.

Under the above heading the English *Gardeners' Magazine* publishes the following:

Although we sometimes hear complaints of judging in England, we doubt very much whether anything so severe has ever been said of English judges as a correspondent, an American, writes about his countrymen who act in that capacity, and it is to be hoped with some degree of exaggeration. He says, "Mr. ——, who grows practically no chrysanthemums, and until the last year or two hardly saw them, poses as a judge, &c. Of such stuff are all our committees and judges constituted. Fifty per cent. hardly knowing one name from another and never judging blooms by merit or points, simply size and stiff necks, that is all they can see. Sad to say shows in this country have fallen into the control of what we call market or cut flower growers, a class you do not have, who look with but one object in view, what can they get out of it, will it do for market growing, and anything that is not a clear yellow, white, or pink has a hard show for existence." He concludes by adding that the judging is in the hands of those who are almost wholly in the trade and know but few varieties. Fifty per cent. of the judges, says this writer, should be shoveling coal instead of setting themselves up as florists. We can only hope for the credit of the chrysanthemum, that the other half are high-minded, impartial conscientious men whose influence will act as a counterpoise to the coalheavers.

[It would be interesting to learn from our esteemed coadjutor's correspondent why these incompetent men are selected by the committees of the various societies to act as judges. We apprehend they do not appoint themselves.—ED.]

We have often heard the wild braying of disappointed exhibitors but we did not before realize how long were the ears possessed by the arch-sorehead of them all. The mouthings of this contemptible fellow would be beneath notice had he not secured publicity for his ill-natured resentment in a foreign press whose readers are not in a position to judge of the animus of his attack.

Our judges may not all reach the high standard that is to be desired but we affirm without fear of contradiction by anyone except C. H. P's correspondent that all are "High-minded, impartial, conscientious men," and further that there are none who do not have a better knowledge of chrysanthemums than the writer of the libellous screed noted. Most assuredly the "Judges do not appoint themselves," which accounts for the fact that C. H. P.'s correspondent has not been called upon to act. The "Committees of the various societies" seek men who meet C. H. P.'s description—and get them.

DO YOU WANT a complete alphabetical list of chrysanthemums in commerce in America, with class, and brief, accurate description of each? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

TO PREVENT RUST.—Dissolve one pound of sulphate of copper in two quarts of ammonia in a 2-gallon jar. When dissolved add another quart of ammonia and stir well. [The liquid can be kept in this form for some time and used as needed.] Add a pint of this solution to a barrel of water and syringe the plants with a force-pump every two weeks. And don't let the time for spraying pass without attending to the operation.

Carnation Notes.

Carnations are over now with most growers and it is well to commence getting the houses into shape for next winter's planting. They should be cleaned out thoroughly and then fumigated well with sulphur to clean them of all fungoid growth. If you intend changing the soil do it now and when you have it all out give all wood work inside the house a coat of lime. There is nothing so good as lime for sweetening up a house and it is at the same time a good wood preservative. If the houses need paint do not put it off until next season but give it to them now. Attending to such items at the proper time means a longer life for the houses.

I do not find it any advantage to change the soil in my houses oftener than once in about three years, but this will not apply everywhere nor with every soil. When we do change we do it about this time and when the soil is all in we give it a coat of manure mixing it in thoroughly and then water it well so as to get the weeds to start, afterwards permitting it to get perfectly dry, killing the weeds and sweetening the soil again.

If you have some old rose soil, that is about as good as anything you can use. If you do not happen to have any prepared soil, take a good garden loam and add manure enough to it to bring it up to the standard. Not growing anything but carnations myself I find this latter method to be a considerable saving in time and expense over preparing a soil, and to be quite as good in every respect. The manure used should be well rotted and about two years old, having been handled once or twice during that time so as to be available for plant food at once.

In changing soil on benches they should be thoroughly cleaned off and given a coat of lime before putting in fresh soil. Some growers take only a few inches off the top and add fresh soil to that extent but it pays to clean them out clean when you do change. On solid beds taking four to five inches off the top is all that is necessary, although six inches will not hurt the plants any. If you are not changing the soil it pays to keep the houses clean during the summer months as well as in the winter. See that no weeds are allowed to ripen seed to annoy you when the house is planted. Give the beds and benches their coat of manure and mix it thoroughly with the soil so as to be ready to plant whenever you want to start in. Doing this now will give the weed seeds in the manure a chance to germinate and they are more easily destroyed while the beds are empty. Use the oldest and best rotted manure you can get and don't use it too sparingly, especially on the benches.

ALBERT M. HERR.

Gastropods in Piqua.

I am in receipt of a clipping from a newspaper published in Piqua, O., giving an account of a meeting of the city council which reads as follows:

A TERRIBLE NUISANCE.

For two years the residents on North Broadway in the vicinity of the two greenhouses, located on that street, have been troubled with large snails which it is claimed come from the greenhouse. These snails have become so numerous that the people are desirous that something shall be done that will abate this nuisance, in order that they may be kept out of their wells and from getting in their houses. Dr. W. J. Prince the City Health officer was present and stated that this complaint had been discussed by the Board of Health, who had come to the conclusion that the best way to abate the nuisance was to order the greenhouses removed outside of the city limits. To do this would require the action of the City Council and the Health Officer requested that a committee be appointed to act in conjunction with a committee from the Board of Health whose duty it should be to take the proper steps to have the greenhouses removed outside of the city limits.

A local florist, Mrs. H. P. Smith, is the victim whom these wise city fathers and enlightened health officer are about to evict because her greenhouses have been the cause of a visitation of snails. Mrs. Smith asks the following questions:

"Have you ever known of a greenhouse being moved on account of snails?" "And can they be moved?" "If the greenhouses were moved outside the corporation (the snails are now in the cellars, yards, etc., of the neighbors) would the snails be likely to disappear in course of time?" "Are snails known to live out of doors through the winter, that is in a rubbish pile or under a board?" "Would like to hear other florists' opinion in regard to the so called snail question?"

The above are the chief questions asked. It it were not that it appears a serious question to Mrs. Smith, the whole thing is so preposterous and ludicrous that I think the proper authorities to deal with the question would be *Puck* or Mark Twain. The Mollusc which is destroying the city of Piqua is called by Mrs. Smith and the City Council snails. Are they what are popularly known as snails or are they what are usually called slugs? The latter are much commoner in this country than snails. I am not going to write a treatise on this widely distributed family, but will say that in some countries, Scotland for one, there is no distinction made between snails and slugs, and the latter word is absent from the vernacular vocabulary of that country. Snails have large conspicuous spiral shells in which they can retreat and remain living a long time, even two or three years. The term slugs is applied to those whose body is naked, the shell being merely rudimentary and concealed. Members of this family are found in all parts of the globe, the family Helicidæ alone having upwards of 1200 species. Some are aquatic and some only amphibious, some breathe air and some don't, some carry a comfortable house on their back, while possibly through the carelessness of their remote ancestors others have to go without that useful appendage. It matters not whether they are of one genus or another, there is no evidence, or any attempt at evidence, that a single species is poisonous or of the slightest harm to man or beast, except that they feed on the tender morsels of the garden. One species, Helix pouratia, is known as the "edible snail" and is commonly eaten in France and Italy, as well as other species. There is no doubt that they can survive our winters and are found most common in localities where they can shelter only under the fallen leaves.

About the legal question: It is too absurd to seriously enter into. The greenhouses have neither generated nor harbored the snails. They might as well ask for the removal of the houses because greenfly has been troubling the roses of the town or that the odor of Lilium auratum coming from the greenhouses is too strong for some invalid neighbors. Small slugs are very fond of adiantums and several other of our greenhouse plants and we have to fight them, but there is nothing in the greenhouse that the larger species are fond of and they are rarely seen. Just let these councilmen make a move to have the greenhouses removed and Mrs. S. could soon show what a set of ignoramuses they are. And she could prove by the evidence of hundreds of intelligent men that a greenhouse was no more conducive to the welfare of snails than is a church. Not only would it be impossible for the city to remove the houses for any such alleged nuisance but Mrs. Smith would be justified in claiming damages from the city for injury to her business from such idle and unwarrantable talk. Many people might be afraid to buy a geranium from Mrs. S. for fear of catching the snail disease.

But just fancy living in a city in the great state of Ohio in this age where the health physician and the board of health discuss and then decide that the best way to "abate the snail nuisance" is to order the greenhouses removed. It is a relic of barbarism antedating the dark ages. The councilmen and health physician ought to be inoculated with Cyclostomidæ Ampullariidæ.

WM. SCOTT.

PROF. L. O. HOWARD.
Government Entomologist.

Prof. L. O. Howard.

We present herewith a portrait of Prof. L. O. Howard, the new Chief of the Division of Entomology of the U. S. Dept. of Agriculture, Washington, D. C.

Prof. Howard was for sixteen years first assistant to Prof. C. V. Riley, who recently resigned the position of chief of the division, and he is therefore in close touch with the practical work in hand, and will assuredly carry it out on the same broad lines that have been followed in the past.

It is gratifying to note that faithful work has been rewarded by deserved promotion and that the voice of the departing chief was heeded by the powers that be in naming his successor.

The Division of Entomology is to the horticulturist as well as the agriculturist one of the most important of the branches of the U. S. Department of Agriculture, and the government can do no greater service to those two great industries than by furnishing every facility to specialists to carry on their work of ascertaining by experiment the best means of combatting the insect pests that are increasing in number and variety with such alarming rapidity.

Furious Hail Storm at Newport, R. I.

The great storm of July 14, was the most destructive ever experienced here, and the desolation and confusion it created during its few minutes duration will not soon be forgotten. The streets are littered with leaves and branches and the hapless greenhouse men are busy raking up the shattered remnants of their roofs. The track of the storm was not more than a mile and a half wide but it carried destruction to every glass house in its course and most unfortunately its path was right through the section where are located those who could least afford to bear the loss, the hard working florists and market gardeners, with whose growing crops and greenhouses it wrought cruel havoc, while the conservatories of the wealthy residents escaped with the most trifling damage.

The hail stones were of enormous size, flattened and shaped somewhat like a tomato and came down with such force as to bury themselves in the earth, board surfaces being deeply dented and tin roofs cut clear through in some places.

Carl Jurgens was the largest loser. Both his establishments were completely riddled, there being practically no glass left on 21 houses covering 60,000 feet of ground. Roses in splendid condition, which he depended upon for summer cutting are smashed down, and mildew from Newports' foggy atmosphere will complete their ruin. Mr. Jurgens estimates the value of glass destroyed at from $6,000 to $8,000, but the loss on the plants and loss of labor will add several thousands to this estimate.

Another heavy sufferer is William Findlay, and much sympathy is expressed for him. Three plant houses and eight fruit houses is the extent of his establishment. Bruised peaches and nectarines are thickly strewn among the broken glass, and five crops of grapes are badly damaged with little hopes of escape from the dreaded mildew. Outside hydrangeas and other show plants are cut to pieces and two large melon patches are ruined. Mr. Findlay's loss, including prospective profits from fruit crop, will amount to $6,000 or $7,000.

Aaron Brandt, with eight houses, loses about 90% of his glass and estimates his loss, including grapes, at several thousand dollars.

Gibson Brothers' 9 houses were built of the finest double thick glass but they fared little better, not more than one-fifth escaping. Their loss will be several thousands.

Henry J. Haas suffered a damage of nearly one thousand dollars.

K. Phelen's 4 houses were completely ruined.

G. H. Riggs lost about 10,000 lights of small glass, M. Butler & Son 15,000 lights and J. M. Hodgson, John Allan,

Thomas Galvin and the Newport Nursery Company escaped with less damage.

The only private places that met any serious loss were H. G. Marquand, Geo. Harman, James Gordon Bennett, E. J. Berwiad and Mrs. Paran Stevens.

The storm after leaving Newport passed over Middletown where Wayland Smith and other market gardeners' got a taste of its fury.

Newport will be a gold mine for the glass men for some time to come. Not one of the parties injured had any hail insurance. They had no idea it would ever come their way.

Coming Exhibitions.

ATLANTIC CITY, N. J.—Trade exhibition Society of American Florists. G. C. Watson, Sup't of exhibition. 1025 Arch St., Philadelphia, Pa.

BOSTON, Sept. 5-6. Annual exhibition of plants and flowers Mass. Hort. Society.

[Secretaries will confer a favor by supplying dates as soon as decided upon. We shall be glad to know of any further shows decided upon and not included in our list, even if exact date is not yet determined.]

Hardy Flowers for August.

The month of August brings us to the last of the flowering trees of small stature. Yet few as they are they would, if gathered into a small garden, command a good deal of surprise and attention, while when distributed over miles of territory they are lost in the prevailing ocean of green.

The trees are chiefly Aralia chinensis vars., Clerodendron trichotomum., Kœlreuteria paniculata, Oxydendron arboreum, Rhus semialata vars., Sophora Japonica vars, The sorrel tree (Oxydendron) flowers in July southwards, where it becomes very beautiful in flower, seed and folinge.

There are still a good number of flowering shrubs, some of which are repeated from my midsummer list, and will be repeated again in September, either because they are enduring in their periods of bloom; or that they continue ornamental from their seed pods, and fruits. The shrubby plants peculiar to this month are well worth massing together for special effects, as are those of any season. The habits of our people render these special effects desirable at the summer resorts. There can be no doubt but very striking effects can be had by these seasonal displays, although they have received but scant attention. To be sure we begin to see what the tulip and rhododendron can do—and perhaps the rose—but beyond them we have nothing of the kind which gave to Cliveden (Mr. Astor's English home) its world wide reputation for its seasonal displays. It is perfectly feasible to plant for an exhibition which will endure a month, or two, and still leave the beds to be filled with bedding plants or annuals. Such shrubs as the following if tastefully grouped are capable of rich effects.

Althæa syriacus varieties.
Buddleia Lindleyana.
Calluna vulgaris.
Clethra acuminata, C. alnifolia, C. barbinensis.
Callicarpa purpurea.
Clematis crispa, C. Davidiana, C. flamula, C. paniculata, viticella, etc.
Clerodendron viscosum (S.).
Desmodium pendulilorum.
Dabœcia polifolia.
Daphne Cneorum.
Erica vagans.
Euonymus Sieboldianus.
Gordonia pubescens (S.).
Hydrangea hortensis (S.). H. paniculata varieties.
Hypericum hircinum, H. multiflorum, H. prolificum, H. densiflorum, H. galioides, H. Moserianum, H. calycinum, H. patulum, H. aureum.
Hibiscus roseus, H. malva-alcea, etc., are technically herbs, but assume the character of good sized shrubs when given room on a lawn.
Indigofera Dosua, usually dies to the ground in this climate.
Kerria japonica is often very showy in late August.
Lespedeza bicolor (S.).
Leycesteria formosa (S.).
Lagerstrœmia indica (S.).
Lonicera Halleana.
Polygonum cuspidatum, P. Sachalinease.
Potentilla fruticosa.
Rubus odoratus.
Rhodotypos kerrioides.
Rhus copallina.
Rosa Wichuraiana, rugosa vars., and such hybrids as Mrs. John Laing, Dinsmore, Clothilde Soupert, etc. etc., and I would like to direct attention to the fact that R. lævigata is hardy on walls as far north as Trenton.
Spiræa Douglassii, S. salicifolia, S. tomentosa and the varieties of S. Bumalda, if pruned after the spring flowering.
Tamarix chinensis.
Tecoma radicans, T. grandiflora.
Vitex agnus-castus, V. incisa (S.).
Periploca græca (the silk vine) also flowers during August, but is scarcely showy.

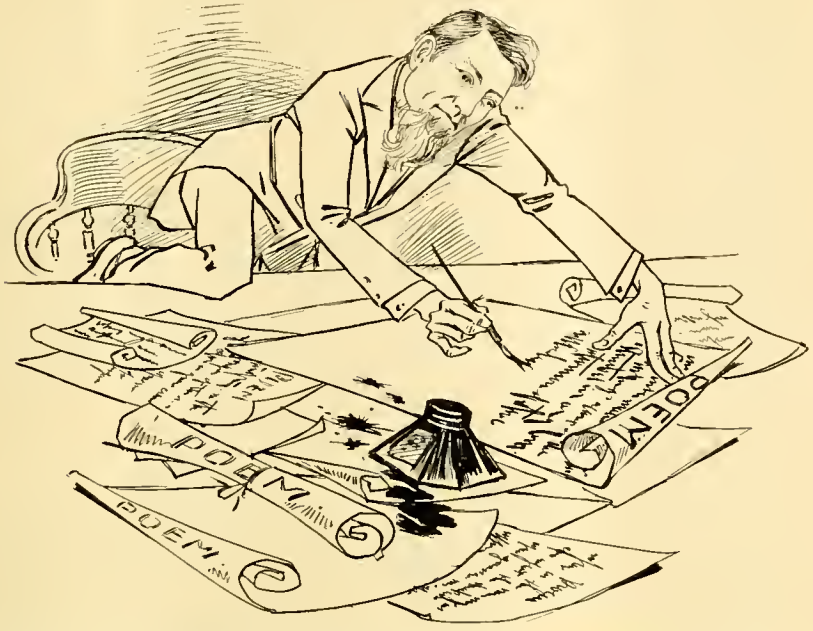
The most brilliant displays are to be had however, from the herbaceous plants. In many cases these are not surpassed by any plants anywhere.

Acanthus latifolius.
Achilleas.
Aconitum Napellus vars., A. lycotonum, A. uncinatum.
Alliums.
Artemisia Stelleriana.
Aster Amellus Bessarabicus, A. spectabilis, A. longifolius, A. formosus, etc.
Ansonia salicifolia.
Bocconia cordata.
Bessera elegans.
Cassia Marylandica.
Catananche cœrulea, etc.
Campanula Mariesii, C. carpathica, etc.
Callinhoe involucrata.
Cimicifuga racemosa.
Coreopsis tripteris.
Crinum Powellii (S.).
Begonia discolor (S.).
Delphinium formosum, D. sinense, D. nudicaule.
Echinacea purpurea, E. angustifolia.
Eryngium giganteum, E. amethystinum, etc.
Euphorbia Myrsinites.
Eupatoreum ageratoides, E. cælestinum, E. perfoliatum.
Funkia purpurea, etc.
Gaillardias.
Galtonia candicans.
Gentiana Andrewsii varieties.
Gypsophylas.
Helenium autumnale, H. multiflorus.
Heuchera sanguinea.
Hibiscus militaris, H. moscheutos.
Helianthus species and varieties.
Hemerocallis Thunbergii.
Ipomœa leptophylla (S.).
Liatris pycnostachya.
Linum species.
Lilium Henryii, L. Brownii (S.), L. speciosum varieties, L. sulphureum, L. tigrinum varieties.
Lythrum superbum.
Lobelia cardinalis.
Mimulus cardinalis.
Malvas.
Milla biflora.
Rhexia virginaica.
Œnotheras.
Rudbeckias.
Ruellia ciliosa.
Sedum Sieboldii, S. spectabile, S. Telephium varieties.
Statice latifolia.
Tricyrtis hirta.
Vernonia Nova-boracensis.
Veronica longifolia sub-sessilis.

Besides these are the innumerable varieties of Phlox paniculata, pentstemon, salvia, the various aquatics and zephyanthes, gladiolus, and other bulbs, which at the north are neither regarded as hardy or herbaceous.

Trenton, N. J. JAMES MACPHERSON.

Philadelphia.



We have heard of various plans for shading greenhouses, but this one is something a little out of the common and is not likely to be generally adopted. A certain grower in this vicinity having a lot of roses planted and wanting to shade the house in a hurry could find nothing better for the purpose than a little flour. Sending his man ahead of him with a hose to wet the glass he followed scattering the flour over the wet surface. It was easy to get it on, but oh my, what a job to get it off! A little whiting is now always on hand.

Atkinson & Son of Edgewater are now cutting asters, the first we have seen from houses planted for summer cutting; $1 per hundred is asked for the flowers.

Carnations are still plentiful but the crops are falling off. Kaiserin, La France and Testout are looming up.

Thomas Foulds, of Gynedd, is carrying some really fine Mermets. They would have passed last winter. Mr. Foulds has had great success the past season with both Mermet and Bride and intends to leave the plants, which look very fine, in for another year. He says he has no particular method of treating them but thinks his soil is such that he can give water more freely than most Philadelphia growers.

Sweet peas are plentiful and despite the

THE BARD OF KINGSESSING WRITES AN ODE UPON THE CHARMS OF ATLANTIC CITY IN AUGUST.

dry weather some really good flowers are to be seen. Miss Baker of Media seems to have great success with this flower.

Rain is very badly needed in this vicinity and many outside crops are suffering in consequence.

President Lonsdale has appointed the following gentlemen on the various committees that will have charge of the Philadelphians' and the social features of the convention.

ENTERTAINMENT—John Burton, Robert Craig, H. H. Battles, John Westcott, Chas. D. Ball.

RECEPTION AND REGISTRATION—David Bearn, John W. Colflesh, August Lutz, Joseph Heacock, John Welsh Young, Harry Bayersdorfer, Geo C. Campbell, Harry W. Schroyer, Wm. J. Baker, D. D. L. Farson, Robert Crawford, Jr., Fred Hahman, John G. Gardner, John M. Hughes.

EXHIBITION—George C. Watson.

LADIES—Chas. D. Ball, Wm. Warner Harper, Alex. Scott, Charles E. Meehan, Wm. Patterson Craig.

TRANSPORTATION—Thos. Cartledge, Geo. C. Watson, John Westcott.

HOTEL ACCOMODATIONS—Robert Kift, H. C. Scheaffer, Jos. Heacock.

PRESS—Geo. C. Watson, H. C. Scheaffer, D. D. L. Farson, Robert Kift.

BOWLING—George Craig, George Anderson, John Westcott.

Everything in connection with the coming convention is working smoothly. The entertainment committee, on which the burden of the work falls, is a strong one and their part will without doubt be well done.

Superintendent Watson says that nearly all the exhibition space has been taken up and that this feature of the convention will be well worth seeing. All the latest greenhouse appliances as well as all staple articles will be seen in competition and he says that without doubt the display will be one of the educational features of the meeting.

"Terrified at the thought of imprisonment Frank Robinson of Wynnewood, Montgomery Co., who was locked up at the 28th District Station House charged with the larceny of $75 from a florist who employed him tried to hang himself in his cell using his clothing for a rope. The turnkey discovered him and cut him down before it was too late." The above news item is from yesterday's paper. We have been unable to ascertain the florists' name, but we think it must have been remorse at having robbed a florist that prompted the poor fellow to attempt to take his life rather than fear of imprisonment.

One of our city florists was found fast asleep with his feet propped upon a chair across his doorway recently. Customers had to first wake him up to get inside.

H. H. Battles has given up his contemplated trip to Europe. Mr. Battles has not been in the best of health recently and this with the press of business has caused him to defer his trip.

Alfred Hoag met with a painful accident on Saturday last. A game of corner ball between married and single men was in progress at David Bearn's place at Bala. Mr. G. C. Watson was at the bat and swinging it for a home run he caught Mr. Hoag very near the eye. It was a very dangerous wound but with the aid of a surgeon he was fixed up and it is hoped nothing serious will result.

At a meeting of the bowlers on Saturday evening last Robert Kift was elected captain of the team to represent Philadelphia in Atlantic City. It was decided also to bring the cup back to Philadelphia. Other aspirants will please take notice, particularly the "Leuleys." K.

Chicago.

With a feeble gasp once in a while the market denotes the fact that it is not entirely dead. The closing days of the past week showed what at this season of the year might be called quite an activity. On Saturday the market was sold out clean, a thing that hasn't happened for many a day. Roses without exception are poor; the very best of them could hardly pass muster for second quality, and in carnations it is the same.

Outdoor flowers of all kinds begin to suffer from the continued dry weather. Sweet peas, which of this class are about the only thing in demand, are getting very short in stem for want of moisture.

The shipping trade is still very dull. The railroad troubles are about over and the wholesale men are now looking for an improvement. Collections are reported as very slow, both for the city and country, and so long as the retail trade continues as dull as at present there is small hope for an improvement in this direction. Wholesale men, however, are not the only sufferers. The retailer is obliged to extend credit himself to his customers, and in his case collections are equally poor.

At the last meeting of the Florist Club a very interesting paper entitled "Historical reminiscences of the Chicago cut flower trade," was read by Mr. F. F. Benthey and was much enjoyed by the members. The paper appears in full elsewhere in this issue. In the discussion it appeared that in the "good, old days" the florists of this city were rarely on speaking terms. Referring to a doubtful date one member remarked "I remember that — had a store at that corner in 1870, but I couldn't say as to the interior arrangement, for I never was inside. The feeling then existing was such that it would probably have been unhealthy for me to attempt to go in." Truly the "good, old days" of high prices and independence had their drawbacks as well as their advantages.

An election in July was an unusual feature which was brought about by the resignations of Secretary Keenan and Financial Secretary Maas. Mr. Keenan's affairs had changed so that he was unable to longer attend the meetings and Mr. Maas will remove from the city. The election to fill the vacancies resulted in the selection of Mr. J. B. Deamud as secretary, and Mr. Charles McKellar as financial secretary. Both are able men and will add strength to the club's official circle.

The regular quarterly meeting of the Horticultural Society of Chicago was held at the Sherman House last Saturday afternoon. After the routine business had been transacted, there being no essay on the program, a member laid out some work for the society to do by suggesting that it take up the proposition to establish a tree commission in this city which shall be authorized to plant and maintain shade trees on the streets on the plan followed in the city of Washington. Also that the society vigorously support Alderman Madden in his attempt to have the Lake Front Park improved and creditably maintained. On motion President Chadwick appointed a committee to confer with Mr. Madden and tender him the support of the society in his efforts to secure action in the Lake Front Park matter and any other move that will result in advancing horticulture in this city.

In response to some questions propounded by Mr. Pearson, there was an interesting discussion upon the growing of rhododendrons in this city and vicinity in which it developed that there was some diversity of opinion as to whether lime in the soil was specially injurious to these plants, some holding that it was impossible to grow them in soil containing even a trace of lime or where the water used held lime in solution, and others maintaining that a moderate amount of lime had no deleterious effect.

Appropriate resolutions upon the death of the late Dr. J. A. Kennicott, who had been a very active member of the society, were adopted by a rising vote.

Matters connected with the coming annual fall exhibition were discussed and

it was decided to call a meeting of the executive committee for Thursday, 19th inst.

Boston.

Sweet peas and carnations are the most abundant stock in the market at present. The street boys manage to sell a good many of them but the net prices realized hardly pay for the trouble of marketing. Roses are received in small quantities, but enough for the very light demand.

Mr. N. F. McCarthy is the possessor of a handsome and commodious yacht this season and frequently invites the boys to a sail in the harbor.

Mr. W. H. Elliott of Brighton has leased the Shaw place at Newtonville, recently run by J. F. Curtis. The buildings are being thoroughly overhauled and two new houses are being built.

The Growers' Co-operative Association has arranged for a large increase of floor space at their present location on Park street and have secured a lease of the premises for five years.

An interested visitor at the weekly exhibition on Saturday, July 14, was Mr. Jos. A. Dirwanger of Portland, Me.

New York.

There is very little stock coming to the city at present except carnations and outdoor flowers. Roses of good quality are exceedingly hard to obtain, but this makes little difference as there is no call for them. Lily of the valley sells very poorly this season.

W. F. Sheridan is painting up and renovating his establishment in anticipation of fall trade.

John Raynor is rusticating in the interior of Massachusetts.

Jas. Hart spends most of his time at his mansion in Madison.

Buffalo.

The melancholy days have come,
The saddest of all the year;
When nobody wants any roses,
And of florist stores steer clear.

It's a fact, the dog-day dullness is upon us and there is little excuse for anyone now to buy flowers. It may seem like treating a serious and sacred subject lightly, but nevertheless, a talk with a prominent undertaker a few days ago revealed the fact that they recognise and expect dull and busy months just as much as a hardware or dry goods merchant does, and as July and August are two of their very dullest months, little trade can be looked for in that quarter.

There are plenty of flowers for the little trade that demands them. Mr. W. A. Adams, of the late firm of Adams & Nolan, has started up at the old stand and there is little doubt but what "Andy" will make a success of it. If the good wishes of friends in the trade will help, he certainly has that and a little more.

At the last meeting of the Florist Club held on the 10th at the house of the secretary, it was decided after a lively debate to abandon the flower show for this fall. Pity t'is, t'is thus, but t'is wise. The fact is there are only a few commercial florists here who would sacrifice a few dollars for glory and that is all there usually is in flower shows in Buffalo. Others can't see any benefit to the trade unless they see the dollars dangling before their noses as carrots are hung before a donkey to accelerate his sluggish speed. Others won't join in simply because it will be a public demonstration of their being only 2d or 3d best. How few men can take a beating in anything and come up smiling with admiration for his adversary! When you meet one of those he is a jewel. Another reason for lack of support in a flower show is the almost total absence of anything like a good private place from which we might expect exhibits. In fact there is not a private establishment within 30 miles of Buffalo that amounts to beans. I beg their pardon, perhaps they do grow beans.

There is always a chance to be thankful that things are not as bad as they might be. While we are terribly annoyed with Canada flies, universal flies, tropical weather and lack of business, we have a great let-up in the drummer. For this we ought to be sincerely and devoutly thankful. It is bad enough in cold or moderate weather to have to be civil to them, but just fancy jumping from one side to another in this temperature, when they fix on you that practiced smile or fusillade of chestnuts.

Mr. Alex Scott, of Lauraville, Baltimore Co., Md., spent a week in Buffalo recently. Mr. S. was a resident of this city from 1870 to 1878 and had not visited it for nearly 8 years. He saw many changes. He has a brother residing here also in the business. W. S.

St. Louis.

Trade has been very slow during the past week. About the only thing looked for is funeral work, and that is scarce. Stock is very poor, owing to extreme warm, dry weather and the changes being made at the various establishments at present.

The regular club meeting was held on the second Thursday of the month and a very poor attendance was called to order by President Waldbart. Mr. Koenig, who was to read a paper on "Hardy herbaceous plants," failed to put in an appearance; his paper has been continued, however, and he will undoubtedly favor the club at the next meeting. Mr. Worz was appointed by the president to prepare and read a paper on the "Best method of handling and disposing of flowers by the wholesaler" after the club had heard from Mr. Koenig.

The transportation committee reported that very satisfactory terms had been secured for those expecting to attend the convention at Atlantic City. Owing, however, to there being another regular meeting to be held before the time of departure for the convention nothing final was done in the matter.

This being the regular meeting for the nomination of officers for the ensuing year, the names of the following members were proposed for the various offices, the election to be held at the regular August meeting: For president, Fred Weber, Alex Waldbart, Harry Young, Chas. Connon, R. F. Tesson; for vice-president, Jules Benecke, Frank Fillmore; for secretary, Emil Schray; for treasurer, John Young; and for trustees the following—C. C. Sanders, Jules Benecke, E. H. Michel, Alex Waldbart and R. F. Tesson.

At the Bowling Club meeting on the 14th, officers were elected for the ensuing year as follows: Harry Young, president; John Young, treasurer; and Jules Benecke, secretary. The treasurer's report was read, showing a balance on hand of $3.45. The medals for the last series go as follows: "High Score," Dr. Helwig, average score 201; "Lucky Medal," Rob't Beyer, score 264; Leather Medal, C. Roeper, score 157. Owing to the warm weather it was decided to discontinue meetings until the first Wednesday in September. It was decided also to have a team represent St. Louis at the convention, and while our heaviest men cannot attend, a fair average is expected to be secured. An assessment was levied to purchase six new balls with which the team can try to bowl themselves to glory at Atlantic City.

The committee having the picnic in charge have reported everything as moving smoothly. Arrangements have been made for all the necessary details and a circular gotten out and mailed to all the florists in town notifying them of the event and giving a list of the prizes to be competed for. Judging from the hearty endorsement the idea receives everywhere the event cannot be otherwise than enjoyable to all who participate, and all should make an effort to reach the Highlands on the 25th. R. F. T.

Toronto.

At the Flower Show to be held here by the Electoral District Society the prospects are good for an unusually well grown lot of stove and greenhouse plants ferns, palms, etc. It is to be hoped that the management may see fit to arrange them with a view to greater artistic effect than has been exhibited at this show in former years. Surely with such a fine lot of specimen plants something more might be done than to simply stand them in rows like regiments of soldiers. The management of the chrysanthemum show will also do well to take this point into their serious condition too. I know it is extremely difficult to get out of old grooves, especially in the hurry and bustle of the first day, but with the right man for superintendent, who had laid his plans beforehand, a decided change for the better might be made. The public expects these things to be done artistically these days and as the public has the money which the florists want to transfer to their pockets it would be well to try and attract its patronage as much as possible.

The time has come when stories of big gooseberries, large catches of fish and such like are in season (I have heard no stories of big profits this year yet), and when the pious gardener or florist hies himself with his wife and family to the Sunday School picnic and returns happy and full of cake and strawberries. At all events there is a great dearth of news items just now and the fish stories must wait till the convention and be told viva voce—that is if any of us ever get there. At present it looks as if we should have to mortgage our prospective Christmas trade if we want to see Atlantic City. E.

Pittsburg.

There is little or no business in the retail stores except funeral work. The markets are over run of late with bedding stuff with no demand.

Mr. Lincoln Pierson of the Lord & Burnham Co. was here this week. They will rebuild (or remodel) the greenhouses at Allegheny Cemetery at a cost of about $15,000.

J. H. Troy, of Pitcher & Manda called here last week, and reported business very good.

Mr. H. Neagley and his brother have been adding quite a number of orchids to their already fine collection (private).

A meeting of the Florist Club on Tuesday last brought quite a few of the members together. Committees were appointed to ascertain cost to members o

Hotels at Atlantic City, N. J.

The committee have obtained from the United States, the largest hotel, a special rate of $2.50 per day and a guarantee that they can accommodate four hundred guests. From at least one-half the rooms there is an ocean view, and broad piazzas surround the hotel, from which can be seen an ever moving panorama. There are also many other hotels and cottages who have promised the committee they will make room for the delegates, which list, with prices, is given below.

NAME.	PROPRIETOR.	SITUATION.	CAPACITY.	RATES PER WEEK.
Albemarle,	C. E. Cope,	Cor. Virginia & Pacific Aves.	150	$8.00 to $14.00
Amole,	Mrs. S. C. Amole,	21 South, South Carolina Ave.	40	8.00 to 12.00

transportation to the convention at Atlantic City, and to procure a suitable place for the club to hold a picnic about the first week in August.

Mr. B. Elliott, of Elliott & Ulam, has returned from his wedding tour, looking bright and gay as usual. A. J. E.

Montreal.

The season just past has been very unsatisfactory to the florists, especially those who make a specialty of bedding plants. A much larger stock was grown but the sales were less, and the result is each grower has thousands left over.

At the regular monthly meeting of the G. & F. Club on Tuesday, the 10th, resolutions of condolence were drafted and ordered to be transmitted to the family of the late James Burnett. By the death of Mr. Burnett the club has lost a kind and generous friend, and Mr. Bland a good and sympathetic employer.

At the same meeting a paper was read on greenhouse firing or stokeing which brought out a deal of discussion, a few very valuable wrinkles being exchanged.

There being a vacancy in the office of corresponding secretary through the resignation of Mr. Stocking, Mr. James McKenna, consented to fill the position for the balance of the year. His address is Cote des Neiges, Montreal, P. Q.

The date for the chrysanthemum show has been decided on, viz., November 7, 8 and 9, in the Windsor Hall. The advertising spaces in the prize list are being fast filled up, many of the leading American firms having secured a page each.

Mr. Bennett's new place at Lachine is fast approaching completion. It will certainly be the most commodious and complete establishment in this vicinity.

Mr. James Bray has sold out his neat little establishment on St. Catherine street, to George Hopton. The new firm is Harris & Hopton. Mr. Bray will in the future confine himself to landscape work.

The first exhibition of the Canadian Pansy Society took place last Saturday, and was fairly well attended. But as the season for out door roses had just passed and owing to the extreme hot weather lately there were no good pansies, the show was a failure in regard to quality of exhibits. A table of perennial flowers was much admired.

The show was held on Mr. Alfred Joyce's place at Outremont, the beauty of which made up in a great measure for any disappointment in the matter of exhibits. These grounds comprise some 7 or 8 acres and are a picture worth admiring. The collection of herbaceous perennials there must be one of the largest in the country. A large bed of dahlias, although early in the season was in full bloom. Mr. Joyce is an enthusastic lover of flowers and at every turn some fresh novelty is seen; whether in the shape of newest fuchsia or geranium, hardy perennial or shrub, they are all here. Mr. George Robinson the gardener deserves great credit for the neat manner in which the place is kept. BEAVER.

July 12.

Worcester, Mass.

Some rain has fallen during the last two weeks but not enough and we are again suffering from very warm, dry weather and kicking as hard as ever; what a lot of things we have had to kick about this season, the kicking attachment seems to be the only part of a florist's anatomy that never gets tired.

The plant trade has died a natural death and trade in cut flowers, although dieing a little harder and giving a few more gasps and struggles seems to be in the last throes. Society's last few stragglers have shaken the hot dust of the city off their russets and have flown away to seashore and mountain, while the weary florist is hustling to get cleaned up in time to reach Atlantic City in August and have a whack at it himself.

We had a good exhibition on the twelfth and a very fair attendance; the number of entries made up for the shortness of the schedule, the entries of zonal geraniums and twenty-four vases of distinct varieties of cut flowers being especially numerous. A. A. Hixon had a splendid stand of geranium trusses, all of good varieties, and M. F. Brierly had the next best.

F. A. Blake's stand of cut flowers contained some splendid and rare specimens which showed careful cultivation; Mr. Blake was awarded first for twenty-four vases, and Mrs. E. C. Brooks second.

The display of gloxinias in bloom was good; the plants, though well grown and flowered, were a little smaller than usual. H. F. A. Lange received the firsts in the two classes, and J. A. Abbott and Mrs. A. T. Buxton the seconds. It was a little too late for Lilium candidum in this section and consequently the exhibit was not up to the standard.

O. B. Hadwen was awarded a gratuity for a display of twenty-three varieties of coniferæ foliage, which made an interesting exhibit. H. F. A. Lange showed vases of coreopsis and Nymphæa odorata rosea that were awarded gratuities, and Arta Pierce also received an award for a stand of native wild flowers.

An interesting feature of the show, though not exactly in the florist line, was an exhibit of early celery grown by John Yacuhokouski. SEEDLING.

July 13, 1894.

Cleveland.

At the greenhouses of Wamelink Bros. stock of all kinds is in first-class condition, especially the roses; all the old stock has been thrown out and vigorous young plants put in, which are growing finely without a speck of mildew or spot. There is one house of Bridesmaid, one of Brides, one of Beauties and one of Mermets and Perles. The houses are all of uniform size being 20x100 feet. The chrysanthemums have been benched and are coming along nicely. Carnations have been discarded by this firm and they will not grow any the coming winter. J. C. Stanley, formerly with the Oakwood Rose Gardens, is in charge, ably assisted by his brother.

J. T. Wamelink is building a fine residence near the greenhouses and will move out from the city in the fall.

Kunze Bros. in Newburg is a comparatively new firm. They have three houses, 20x125.

G. M. Naumann, on Doan street, who by the way is not in the last florists' directory, put up two new houses the past spring.

Visitors the past week from out of town were, H. C. Steuger, Chicago; S. A. Anderson, Buffalo; and W. S. Rennison, Sioux City, Iowa. L. F. D.

Society of American Florists.

Indications point to the probability of a very large attendance at Atlantic City next month. As in previous years members may escape the crowd and inconvenience of paying dues and securing badges at the convention hall by remitting the amount ($3.00) to the secretary by mail at any time previous to the meeting. Certificates and badges for 1894 are now ready and will be mailed to members as soon as dues are received.

Members in arrears are reminded that the membership rules of the society require that all delinquents shall make good the amount of their arrearages before being entited to badge and privileges of membership for the current year.

WM J. STEWART, Secretary,
67 Bromfield St., Boston, Mass.

Orders for less than one-half inch space not accepted.

Advertisements must reach us by Monday to secure insertion in the issue for the following Thursday.

Address THE AMERICAN FLORIST CO., Chicago.

WORTH STRIVING FOR.

Our readers are reminded that the Society of American Florists has provided handsome medals of gold, silver and bronze to be competed for each year at the time of the annual meeting. These medals are offered to the originators of new hybrids or varieties raised from seed or for the discovery and introduction of new species or varieties that are decided improvements upon existing kinds. The awards are to be made in accordance with the following rules:

No award shall be made for any plant that has not been grown at least two years in this country and exhibited at least twice before some regularly recognized horticultural society, where it shall have received a first class endorsement in writing by said society. Further, that it have the endorsement in writing of three members of the Executive Committee before it shall be considered by the full Executive Board and then only shall such award be made by a two thirds vote of the Committee, such species or variety to be shown in plant form and cut state where practicable. Not more than one medal shall be awarded in each class, and not more than three in all in each year.

These are close restrictions but they are none too close if the awards are to have that high value which will make them worth striving for. We have had the pleasure of seeing the medals and they are certainly very beautiful. The gold medal is valued at over $80.

STUDY UP.

A fact frequently commented upon is the prevailing lack of practical knowledge on the part of many of the employes in our flower stores regarding the goods they handle. Not only do they know nothing of the culture or habits of the plants and flowers which they sell and are unable to answer truthfully the numerous questions which customers purchasing plants are sure to ask, but frequently they are found to be incapable even of giving correctly the names of the most common varieties.

It would naturally be supposed that their ambition for future success and preeminence in their chosen occupation would be a sufficient stimulus to study and investigation on the part of our young men, and it would seem that a sagacious employer would make horticultural intelligence a more important requirement when hiring assistants, especially nowadays when many of the most desirable customers are well up in the knowledge of plants and flowers.

We should hear less of this lamentable ignorance if our young men would only make an effort to avail themselves of the abundant opportunities for information which are within their reach. What better use could they make of the long dull weeks of summer time which are too often wasted in indolent lounging? The time which now hangs so heavy on their hands if applied in an earnest effort for mental improvement would pass quickly and happily, and would leave them something to be proud of.

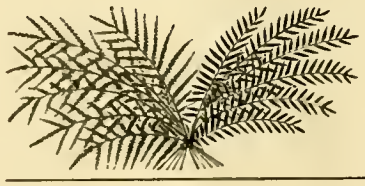
Try it, boys, and you will never regret it. There are indications that the business is already overcrowded. Unemployed gardeners and clerks are more plenty than situations are; but rest assured that there is never a day when the best man is not in big demand. There is always room at the top.

Alpine Plants in the Harz Mountains.

Some three years since a Botanical Garden was established on the Brocken, one of the highest points of the Harz Mountains, having in view a trial of the Alpine plants. Much care has been bestowed on these experiments without success. It has been found with few exceptions the Alpine plants will not thrive in that section, the raw severe winds prevailing proving disastrous. C. C.

DO YOU WANT a list of trade organizations, both national and local, with names and addresses of principal officers, time and place of meetings and other information? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

The reproduced Sets, in reduced size, of



Long's Florists' Photographs

are quite the thing for the use of Branch Stores or Agencies. Charts for making a price list go free with each group of Funeral Designs. The pictures are very clear and distinct. Prices absurdly low considering their character. $1.50 to $3.00 for sets of 27 subjects, and $3.00 to $5.00 for sets of 54 subjects. Send for catalogue.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

D. I. BUSHNELL, St. Louis, president; S. E. BRIGGS, Toronto, 1st vice-president; A. L. DON, 114 Chambers street, New York, secretary and treasurer.

H. A. SALZER sailed for Europe July 11.

MR. D. M. FERRY, Mrs. Ferry, D. M. Ferry, Jr., and Blanche Ferry sailed for Europe on the 11th.

SPRINGFIELD, OHIO, JUNE 10.—J. H. Mellin purchased at public sale the orders and customers lists of Chas. A. Reeser for $725.00.

KEARNEY, NEB.—A severe hail storm destroyed much of the vine and corn seed crops in this vicinity on the night of the 8th. Beans are also hurt.

The Pea Crop.

Reports from Northern New York dated July 10, indicate that the severe drought of ten days previous and still continuing has very seriously affected the crop and that excessive shortage is now anticipated unless early rains occur.

Horticultural Exposition at Erfurt.

The display here is very creditable. The flower beds at this time (June 25) are planted mainly with geraniums and Pansies.

E. Benary has a fine bed of Bugnot pansy. N. L. Chrestensen, a good bed of Pansy Meteor, a very distinct sort. Platz & Son show an extensive exhibit of tree currants and fuchsias. Chr. Lorenz an elegant group of cacti, also carpet bed of same. F. A. Haage a fine bed of ten week stocks. Benary a good bed of petunias. Haage & Schmidt show pansies and a large collection of herbaceous plants.

There is a new yellow variety of stocks called Princess May claimed to be the earliest. Also Aurora, a new creamy yellow pink tinted. Both should be good sorts for the American trade. C. C.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

Freesias, best in the U. S.
New Seed Primula, Pansy, etc.

NEW YORK: 26 Barclay Street. VAUGHAN'S SEED STORE 146-148 W. Washington St., CHICAGO.

Mention American Florist.

Grow Swainsona.

The best and most profitable pure white flower grown. Takes the place of Roman hyacinths or lily of the valley, producing spikes of flowers from 4 to 6 inches long, in the greatest abundance the entire year—never out of bloom—lasting well when cut. 100 Swainsona will pay you three times as much as same space in best carnations. No florist should be without this most useful flower. After a trial it will be considered indispensable.

EASY TO GROW.

An exceptionally good and paying cut flower.

Strong young plants, $1.00 per doz.; $6.00 per 100.

Larger ones, $1.50 per doz.; $10 per 100.

News Notes.

SIOUX CITY, IOWA.—Mr. Walter Rennison is away on an eastern trip.

TORONTO, ONT.—Grant & Robertson have started in business at 192 Howland avenue.

CANTON, O.—J. B. Whitacre lost about $200 worth of glass from hail during the June storm.

WORCESTER, MASS.—H. F. A. Lange is planning to build a house 150x27 feet for summer roses.

CHARLESTON, W. VA.—Mr. Leroy T. Bonsall, formerly of J. E. Bonsall & Son, Salem, O., will establish a retail business here.

SAGINAW, MICH.—Grohmann Bros. are erecting three houses, each 20x100, on their grounds at 3368 S. Washington avenue.

DALLAS, TEXAS.—Spring plant trade was about 25% less than last year. Average retail price of 4 inch geraniums was $1 a dozen. Collections good.

SAGINAW, MICH.—Wm. Roethke is rebuilding three houses 21x100. Frederick Ahrens is building one house 20x100. Mr. Ahrens is a new florist on Emma street, west side.

BROOKLYN, N. Y.—Mr. J. Austin Shaw has secured the American agency for the house of Louis Van Houte, Pere. This will not interfere with Mr. Shaw's florist business, which goes on as before.

SPRINGFIELD, O.—David Wirth is building one rose house 20x100, one plant house 10x100 and one 20x50. Miss Bell Miller is building one house for carnations 18x80. Brown & Canfield added early in the spring a plant house 10x166.

TERRE HAUTE, IND.—Cowan Bros. is the style of a new firm that has purchased John G. Heinl's newer place, containing 12,000 to 15,000 feet of glass. The firm is composed of Mrs. Jane Cowan, James, Edward and Robert Cowan. The address is 2020 Spruce street.

PITTSFIELD, MASS.—Mr. Geo. W. Burbank is starting into the business here. He has two houses, each 17x70, already built and will add another this fall. He intends to build two more houses, each 18x100, next spring, for roses. Mr. J. H. Brumby is his superintendent.

SING SING, N. Y.—Spring plant trade was about the same as last year. Average retail price for 4 inch geraniums was $1.00 a dozen. There was a large increase in the call for pansies and geraniums and much less call for fuchsias. Collections are decidedly more difficult than last year.

WORCESTER, MASS.—Spring plant trade was about 5% less than last year. Average price of 4-inch geraniums was $1.50 a dozen. Increased call for pansies and double red geraniums. Collections more difficult. Taking everything into consideration, spring plant trade was not quite as satisfactory as last year.

TOPEKA, KAN.—Spring plant trade was about the same as last year. 4-inch geraniums will not sell here; customers do not want to pay more than $1.00 a dozen for them, so we keep them in 2½ inch pots and sell them at $1.00. Taking everything into consideration, spring plant trade was about as satisfactory as last year.

SAGINAW, MICH.—Spring plant trade was about 10% larger than last year. Average retail price of 4-inch geraniums was $1.00 a dozen and very good at that. We have found it no more difficult to collect accounts this year than last. Taking everything into consideration, spring trade was as satisfactory as that of last year.

HOUSTON, TEX.—Spring plant trade was about 50% larger than last year. Geraniums are sold here in 3-inch pots, and the average retail price was $1 a dozen. The demand was very heavy for roses, geraniums and pansies. Taking everything into consideration the spring trade was much more satisfactory than last year. All the florists here are doing very well.

ST. PAUL, MINN.—Spring plant trade was about the same as last year in dollars. Average retail price of 4-inch geraniums was $1.25 to $1.50 a dozen. There was an increased call for geraniums and less call for coleus, alternantheras, etc. Collections have been easier as a rule. Taking everything into consideration spring trade was quite as satisfactory as last year.

SAVANNAH, GA.—Spring plant trade was about the same as last year. Average retail price of 4 inch geraniums was $1.50 to $2.00 a dozen. The yearly exhibition of chrysanthemums considerably increased the call for plants and we sold a large quantity at good figures this year. Taking everything into consideration there was hardly any difference in the trade from that of last year.

HAMILTON, ONT.—Spring plant trade was about the same as last year. Average price of 4-inch geraniums at retail was 60 cents to $1 a dozen. We noted an increased call for the dwarf cannas. Collections have been very much more difficult. Of course in view of the above the spring trade was not as satisfactory as last year. There was a lot of plants left unsold, especially in the market trade.

LOWELL, MASS.—Spring plant trade was about 40% less than last year. Average retail price of 4-inch geraniums was $1 a dozen, and leading varieties at that. There seemed to be less call for carpet bedding plants, and hardly any demand at all for alternantheras. Collections have been much more difficult. There was a good deal of price cutting, and taking everything into consideration the spring plant trade was not as satisfactory as that of last year.

CHATHAM, N. Y.—The house mentioned in a previous issue as being built by Mr. R. E. Shuphelt is on the short-span-to-the-south plan, and is for carnations. The house will be glazed with 16x24 glass. Mr. Shuphelt is also erecting another violet house in connection with the house previously mentioned, 10x35. These are not connected with his old houses, but are the commencement of a new set. When these are completed he will have a total of about 6,000 feet of glass.

LONDON, ONT.—Spring plant trade was about same as last year. Average retail price of 4-inch geraniums was 75 cents to $1 a dozen. Increase in call for coleus and geraniums, decrease for alternantheras, cannas and annuals. Collections satisfactory. Trade not entirely satisfactory as we were prepared for an increase. E. Meredith is adding one house 20x100 for roses and one 10x100 for general stock. W. S. Greenway is building two houses 20x80 for chrysanthemums. John Kelly is a new florist who started in last fall with two houses 20x120 and one 14x50.

Water Plants.

Eichhornia Azurea (New Blue Water Hyacinth), each 20c; dozen $1.75.

JOSEPH HEINL, Jacksonville, Ill.

Cincinnati.

Trade during the week has been very spasmodic, funeral work principally, with very few flowers to do same with. White sweet peas, asters, verbenas, candytuft and a few Perle and Mermet roses and balsams seem to be all that is available in this market.

Wm. Gray, manager for J. A. Peterson, showed us a handsome piece of work composed of palm leaves, adiantums and Mermet roses, all tied with a handsome bow of ribbon. Julius Baer has also had quite a lot of funeral work.

The following retail and wholesale florists will close their respective places of business on July 26th to attend the 1st annual outing of the Cincinnati florists: A. Sunderbuch's Sons, Wm. E. Brown, assignee of B. P. Critchell, T. W. Hardesty, Julius Baer, Cincinnati Floral Co., Lew H. Kyrk & Co., Mrs. H. A. Kresken, Robt. A. Betts, Max. Rudolph, The Hoffmeister Floral Co., Geo. Meek, H. Edwards, Fred. Gear, H. L. Sunderbruch and J. M. McCulloughs' Sons' cut flower department. Only three florists refused to sign the closing paper.

Frank Ball has charge of the base ball team for the city and R. Witterstaetter for the growers. Otto Walke will captain the foot ball team, Julius Peterson the bowling contest, Thomas Jackson the qnoit pitchers and Ben George the rowing contest. H. L. Sunderbruch will umpire the ball game. "We are going to have a good time."

While in London Mr. Albert McCullough had the pleasure of attending the 55th anniversary festival of the Gardeners' Royal Benevolent Institution established in 1838. About 150 people were seated at this banquet, said banquet being held at Whitehall rooms, Hotel Metropole. This is one of the finest banquet halls in London and was beautifully decorated for the occasion with orchids, anthuriums, etc. The decorating were donated by the gardeners. This Gardeners' Institution is as I understand, for the relief of indigent gardeners and their families who have aged in the grand work of gardening. In order to become beneficiary of said institution, one must be well recommended and be ballotted on to be admitted. Every year at this anniversary festival a subscription is taken up for the support of the institution and upon this occasion the subscription amounted to 1,250 guineas or about $6,562, which shows the charitable disposition of the London gardeners and their friends. The banquet occurred on the evening of Thursday, June 21st.

The menu contained all that the inner man could ask for, and as five hours was consumed in eating, drinking and talking, we imagine that all enjoyed themselves. Mr. McCullough cannot speak too highly of his entertainment on this occasion. His general trip abroad was a pleasant one and his health much benefited. He reports the bulb outlook good.

John Lodder and daughter, of Hamilton, O., left Monday for a six weeks' trip including Cleveland, Buffalo and Auburn, N. Y.

Herman Schlachter, of Winton Place, reports being robbed of $20 in cash and a check for $60. No clue to the thief.

J. A. Peterson is on the sick list this week, but we trust it will be nothing serious.

J. B. Heiss, of Dayton, O., and W. S. Bell, of Lexington, Ky., called recently.

THE AMERICAN FLORIST CO.'S
DIRECTORY
AND
REFERENCE BOOK
FOR 1894
CONTAINS THE FOLLOWING:

1. The names and addresses of the Florists, Nurserymen and Seedsmen of the United States and Canada, the exact branch of the business each is engaged in being indicated.
2. A separate list of firms that issue catalogues, the space devoted to each branch of the business in each catalogue being also given.
3. A list of the names and addresses of superintendents of leading parks in the U. S. and Canada.
4. A list of the principal cemeteries of America at which the arts of the landscape gardener and florist are used in beautifying the grounds.
5. A complete, alphabetically arranged list of Roses in commerce in America, with class, habit of growth, date of introduction, name of introducer, and brief, accurate descriptions of the flower of each. Synonyms are also plainly given.
6. A complete, alphabetically arranged list of Chrysanthemums in commerce in America, with class, and brief, accurate description of each. Synonyms are noted and varieties that are very popular with American growers are designated by a star, and this year's introductions by a dagger.
7. A complete, alphabetically arranged list of the Carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each.
8. Seasonable Hints for the year, arranged in weeks, written by Mr. William Scott, and covering every detail of a general florist business. This is decidedly the most valuable contribution to the literature of the trade ever published. It is written in a plain, practical way, by a man who knows what he is talking about.
9. A historical sketch of the Society of American Florists from its organization to date, including officers for each year and lists of essays read at each meeting, with other information of interest.
10. A similar historical sketch of the American Association of Nurserymen.
11. A similar historical sketch of the American Carnation Society.
12. A similar historical sketch of the American Seed Trade Association.
13. Similar historical sketches of the Florists' Hail Association of America; of the National Chrysanthemum Society of America; of the Florists' Telegraph Delivery Association.
14. A complete list of all National and Local Trade Organizations, with names and addresses of principal officers, time and place of meetings, etc.
15. Statistics of Commercial Floriculture in the U. S. from the last census.
16. Statistics of the Nursery Industry in the U. S. from the last census.
17. Statistics of Seed Growing in the U. S. from the last census.
18. A list of Leading Horticultural Societies, with name and address of the Secretary of each.
19. Full information about Express and Postage rates on plants, shrubs, trees, seeds and bulbs

No less than 270 pages of valuable reference matter in compact form, and all UP TO DATE.

PRICE $2.00 POSTPAID.

THE DIRECTORY

FOR 1894

IS NOW READY.

PRICE $2.00.

VIOLETS—POT GROWN.

We have a fine stock of pot grown plants, from which experience teaches best results for quality and quantity of flowers can be had:

MARIE LOUISE, SWANLEY WHITE, CZAR AND SCHOENBRUN,

from 2-inch pots, $4.00 per 100; $30.00 per 1000.

Chrysanthemums, young, vigorous stock, just the thing for single stems, in **50 PRIZE WINNING SORTS,** $4.00 per 100; $30.00 per 1000.

We still have a few thousand 2½-inch plants, strong, of **WHITE LA FRANCE and AMERICAN PERFECTION,** at $4.00 per 100; $30.00 per 1000.

Above are two ideal Roses, surpassing most varieties in loveliness of shading, and surpass all without exception for durability in a cut state.

ROSES in best commercial sorts, 2½-inch strong, our selection, $20.00 per 1000. An enormous stock in other departments.

For catalogue and estimates

Address **NANZ & NEUNER,**
LOUISVILLE, KY.

To the Trade.

Any person who wishes for advertising space in the prize list for the coming Chrysanthemum Show of the Montreal (Canada) Gardeners' and Florists' Club, and have not received a skeleton copy of same, should lose no time writing the secretary for one. The list when complete will be circulated widely amongst the trade throughout the U. S. and Canada; also locally, and cannot fail to be a valuable advertising medium.

BEST STRAINS OF

PANSIES

Is what everybody wants and will find in the **DIAMOND STRAIN.** Thousands of amateurs and florists whom I annually supply with this strain say it is the best. Its large and perfectly formed blooms, with thick and velvety petals of an endless variety of rich and delicate colors and tints, often in combinations that if not seen would be difficult to believe ever existed in a pansy, distinguishes this strain above all others. I particularly invite a trial order from florists who have never dealt with me, feeling confident that a trial and comparison with other strains will result in further trade to our mutual advantage.

S. T. MAYNARD, Professor of Horticulture at the Mass. Agricultural College and Director of the Horticultural Departments of the State and Hatch Experiment Stations Amherst, Mass., writes: "It gives me pleasure to say that your Pansy Seeds, Diamond Strain, are the finest we have ever grown."

PRICES; All varieties mixed, over 50 distinct sorts and an endless variety, per ⅛ oz. $1 00; per ¼ oz. $1.75; per ½ oz. $3.50; per oz. $6.00. Cash with order.

L. W. GOODELL,
PANSY PARK,
Hampshire Co., DWIGHT, MASS.

ZIRNGIEBEL GIANT PANSIES.

Owing to favorable weather, have been magnificent this season. Never before have we obtained such size and colors; and as usual, wherever exhibited, have eclipsed everything else, receiving also the most flattering testimonials from the leading florists and seedsmen all over the country.

New seed ready now of both the Giant Market and Giant Fancy in trade packets of 2,000 and 500 seeds respectively at one dollar each, with practical directions for growing pansies. Also plants for sale later on.

DENYS ZIRNGIEBEL,
. . . NEEDHAM, MASS.

Pansy ★ Seed.

The **JENNINGS STRAIN** of high grade Pansy Seed. New crop now ready. Saved with special care from only the very finest varieties and (warranted) first-class in every respect.

THE JENNINGS XX STRAIN.

The cream of Pansies. Grand colors mixed, pkt., 1500 seed, $1.00; 1 oz. $8.00.

The Jennings Strain, finest mixed, pkt. $1.00 about 2500 seed; 1 oz. $6.00; 3 ozs $15.00. No skim milk in this strain. (They are just as good as I can make 'em). To my old patrons I would say they are a big improvement over last season—more variety and finer colors. The best strain for florists either for winter bloom or spring sales; all large flowering.

Black Dr. Faust, finest.....	pkt., 2500 seed,	$1.00

EXTRA PANSY SEED.

MAMMOTH SUNBEAM STRAIN.

A grand collection of giant flowering varieties, very large, of perfect form, and choice colors; carefully selected; better seed plants this year than ever; receive very high praise from my customers; no finer strain offered anywhere; florists should sow of it.

Trade pkt., 500 seeds, 25c; 3 pkts. 60c; 6 pkts. $1.00. A pkt. of the new Monkey Face pansy with every $1 order.

JOHN F. RUPP, Shiremanstown, Pa.

Indianapolis.

Spring plant trade showed a decrease of 25 to 30% from that of last year. Average retail price of 4-inch geraniums was $1.25 a dozen. In view of the decrease of course trade was not as satisfactory as last year. Collections are generally slow.

The July meeting of the Florists' Club was held June 27, on account of the regular day falling on July 4. The Crown Hill Cemetery discussion took up considerable time; it was finally decided to appoint a committee, the same to draft a memorial to be presented to several prominent clergymen, requesting them to take up the matter. The committee was also instructed to see the cemetery trustees.

The picnic committee reported satisfactory arrangements, but also suggested that in place of a picnic a regular weekly bowling club should be arranged for. This proposition was voted down, and the committee authorized to go ahead with arrangements for the annual picnic, with instructions to hold the same on a week day. The committee decided to hold the picnic at Bellevue Club House July 16; all florists invited. Three new members were elected to the club.

Business was reported very quiet; flowers scarce and poor.

John G. Rathsam lost about 400 panes of 10x12 glass by hail June 21; considerable damage was done to shade trees all over the city and vicinity. Lightning struck the dwelling of John Bertermann, knocked off some shingles and weather boards, and passed down the steam pipes which fortunately reached nearly to the roof in the garret. The fall of rain for several days during the stormy season was tremendous, with but very little damage.

Anthony Wiegand returned from California a few days ago, just one train ahead of the strike.

Many shade trees are beginning to die all over the city; leakage of natural gas is supposed to be the cause.

A. Pahud is adding a new house 20x60. John Grande, a new florist at 322 Shelby street, is building two houses, one 18x115 and the other 18x60, with office, etc. Young & Sonnenschmidt are building a house 20x100 and another 12x100 with office, etc. John Fohl, formerly of Mapleton, Ind., has taken Martin Braendlein's place and Mr. B. is now located near Crown Hill Cemetery with two houses 12x60, office, etc., the place heated by steam. W. G. B.

DO YOU WANT Mr. Scott's seasonable hints for the year in book form, so that you can refer readily to his suggestions for any week in the year? You will find them in this form in our trade directory and reference book for 1894. Price $2.00.

LOUISVILLE, KY.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

St. Paul, Minn.

Despite the torrid wave, the unbroken drought and the summer dullness in general there is some call for cut flowers. I do not mean to infer that trade is booming, but for this season of the year it is up to or above the average.

Roses are fair, Kaiserin, Meteor and La France being cut in abundance. Carnations are nearly gone, though a few of inferior quality are still seen. Sweet peas are of fair quality, but not very abundant, owing to the drought. One of our florists is cutting some outdoor gladiolus, the earliest they have ever been seen here.

Roses are nearly all planted out, and judging from the number put out we shall be smothered with roses another season unless times improve.

Chrysanthemums are now receiving attention and are looking fine. L. L. May & Co. have a very fine display of them and will undoubtedly show the boys some fine blooms this fall. Mr. Murray, their practical "mum" grower, is keeping very mum and watching them closely. Other growers about town all have a fine stock and the city will be one mass of bloom by "mum" show time. By the way, brethren, when will the meeting for arrangements be held? Isn't it about time to organize?

Prices of cut flowers are—well prices are not in it. We get what we can and our neighbor does likewise.

The hall where the Republican state convention was held the past week was beautifully decorated with palms and other greens. FELIX.

A. H. HEWS & CO., N. Cambridge, Mass.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

Kroeschell Bros. Co.
IMPROVED
Greenhouse Boiler,
41 to 55 Erie St., CHICAGO.

Boilers made of the best of material, shell, firebox sheets and heads of steel, water space all around (front, sides and back). Write for information.

IMPROVED GLAZING.

GASSER'S PATENT ZINC JOINTS for butting glass makes greenhouses air and water tight; also prevents sliding and breakage from frost. Does not cost as much to heat a house glazed with the joints, thereby saving enough in fuel to more than pay the additional cost of glazing. The leading florists of the country are using them. Write for circulars with full particulars and price list.

Hybrid Teas.

Some growers think these require a very different treatment from ordinary tea roses. In my experience I have not found it so, at least not to any material extent; about the only difference I have ever found in growing them is they are more subject to black spot, and to avoid this as much as possible I advise planting them in a part of the house which will be more likely to dry off readily before night. There have been a great many remedies advocated for the prevention and cure of black spot, but so far as I have tried them I must admit that I have not yet derived much benefit from them. In this, as in all other diseases, I think prevention is better than cure, and certainly one of the best preventives that I have found is a dry, healthy atmosphere at night and never allow the temperature to get down low enough to cause a dew to settle on the leaves. This trouble often starts more early in the season than we think. During September we often get it quite cool towards morning, enough to cause a heavy dew to form on the foliage, while the temperature in the house may not actually fall below 60°; let this be repeated for three or four nights and this disease will certainly get considerable foothold. Under these circumstances a very little fire heat for four or five hours or from 1 or 2 o'clock in the morning till sunrise with some air on the house at the same time will prove one of the best preventives. I do not wish to be understood that this will entirely prevent it, as this disease is sometimes very troublesome even under the most careful cultivation, and should the roots get a slight check by any means it is almost sure to show itself at once, and what would appear the most strange about it is that extremes in either direction are equally sure to produce it. Let the plants get a little over dry at the roots or give them an overwatering so that the soil is somewhat sodden or stagnant and the effect will be almost identical, showing that this disease is very materially influenced by root action. There are other causes also which are quite a factor in this matter: insufficient food of the desired character is one of them, and here I have often thought the chemist could be of some use to us by investigating and giving the formula of what is required to give the plants the food necessary to its highest development, for surely the soils in many sections are deficient in some important elements of plant life. For this subject alone a genuine florists' experimental station, presided over by the right man, could do an infinite amount of good for every florist on this continent, and if such a thing could only be started and carried on successfully every florist in the country would be benefited and should certainly become liberal patrons toward its support.

When in Washington, D. C., in 1892, we tried to get a rose society started on a sound foundation, this was one of the subjects I had in mind and at that time I thought I could see my way clear to get it into such shape, but it fell through from lack of appreciation from certain quarters, though I hope to live long enough to see a rose society firmly established in this country and this subject for one taken in hand and thoroughly investigated, and if it can settle the question (as I have every reason to believe it can) of the absolute cause of this disease, we shall be well repaid for all the trouble or expense it may incur.

But, to return to the subject proper of this article—the growing of Hybrid Tea Roses—all of this class can be grown under exactly the same conditions as ordinary teas with the exception of Meteor, which requires a somewhat higher temperature, and as it is now time to plant all roses for the coming season's campaign where not already done lose no time in getting them planted. If in other seasons you have found certain varieties succeed better in particular positions follow it up by giving them as nearly the same again. There is no doubt that La France, for instance, will generally do better on a back bench than in any other position, that is where it should be grown, and the same adaptability of position may be noticed in other varieties.

If in the past your soil has been found to be of rather a heavy nature and black spot has been troublesome try the addition of considerable sand to the compost, for most of the hybrid teas undoubtedly like a rather sandy soil. But if your natural soil is quite suitable that is the thing to use. Light soils need much more pressing than heavy or clayey soil. Some prefer to beat the soil very firmly before planting and then use a trowel to dig holes for planting; this I think a mistake, making as it does considerable more labor in planting, and as this has to be done generally during the very hottest season the quickest way it can be done consistent with success seems to me the best.

We fill the benches level full of loose soil, mark out position for plants and then with the hand make the hole for and put the plant in position, pressing the soil very firmly around each plant in the hole as we go, leaving a slight hollow or dish-like form around each plant and the balance of the soil in the benches we prefer

to have loose as it is until the plants begin to get new roots fairly well started; this enables us to give the plants liberal waterings without making the balance of the soil sour, and in planting proper it can certainly be much quicker done than by digging holes with a trowel, etc. This is especially beneficial in soils inclined to be heavy.

After the plants get well established and the roots in active working through the new soil we then go over the whole surface of the benches and beat the soil very firmly and then rake it smooth and put on a light mulching.

When they are ready to begin producing flowers, according to the time planted or when the flowers are in demand, all the teas are treated the same way. During the summer and early fall give all the air possible according to the weather outside and leaving considerable air on all night, keeping the plants well syringed at least once a day, and in very hot weather twice with very liberal waterings at the roots, this insures healthy, sturdy growth and a good constitution to stand the strain of winter forcing. JOHN N. MAY.

Grubs Attacking Roses.

There has been some discussion through your columns regarding the character of the grub that sometimes destroys young rose plants in benches. One which had cut the roots of one of our roses and killed the plant we boxed up with soil and manure last August, and here it is. You will see that Jno. N. May was right.

I also enclose a worm which had eaten through the heart of a rose bud. We have found several such.

LOUIS E. MARQUISEE.

Syracuse, N. Y.

To make absolutely sure of the identity of the pests we submitted the specimens to Prof. Howard, Government Entomologist, who writes:

"The insects sent are, first, the common May beetle (Lachnosterna fusca), the larva of which is the ordinary white grub which feeds upon the roots of grass, strawberries and other plants. The worm which had eaten through the heart of a rose bud was badly shrivelled, but seems to be the rose tortricid (Cacoecia rosaceana). This insect, while normally a leaf roller, sometimes works upon buds in this way. I know of no good remedy for the latter insect, but white grubs in the soil may be destroyed by washing down diluted kerosene soap emulsion with plenty of water."

Funeral Wreaths of Summer Flowers.

At this season of the year the most appropriate subject to deal with seems to be the arrangement of funeral pieces composed of such varieties of bloom as is to be had in midsummer, for the reason that during the summer months the florist finds little else to do except work of such a nature. Although the quality of such stock as is at our command at present is not of the highest quality, yet we find quite a number of flowers in great profusion, such as work in admirably for our purpose. Take sweet peas for instance, a simple and inexpensive flower, yet one of the real gems to the maker-up if treated properly. The arrangement of this flower in the form of a wreath is probably what would give the best results, although by no means the only form that would show the flower to advantage, such as a cross or a pillow for instance, still we believe that the wreath, especially the crescent shape, is the ideal form for this flower.

There are quite a number of shades of this flower suitable for our purpose. White, of course, is always proper, but that shade of lavender represented by the variety Butterfly is perhaps the most popular of all. Then the pink and white varieties of such forms as Blanche Ferry or Nellie Jaynes are frequently called for, and then those tones of delicate pink varieties like Princess Beatrice, Crown Princess of Prussia, Apple Blossom, Mrs. Gladstone, and a number of others are suitable. Generally speaking, these flowers show to best advantage if arranged in separate colors, this applies particularly to all pink varieties; the only safe combination of these would be with white. In such sorts, however, as Blanche Ferry we have already a combination of pink and white which can not be improved upon. Only the clear pink varieties, therefore, would admit of this combination, but it is doubtful if the result might be considered an improvement. Butterfly is another variety that admits of no combination except that of white; but whenever we decide on making such a combination, which is often a necessity for want of sufficient quantity of any one variety, don't let us mix the colors indiscrimiaately.

Our first illustration shows a combination of Butterfly and white in wreath form of the crescent type. The arrangement is of the simplest and calls for no special comment, only be careful to avoid close bunching of the flowers in stemming. We don't mean by that that you should stem each stem separate on a pick. It saves time to wire three or four stems together, but have them of unequal length in order to allow of a loose arrangement. For a finish some of your customers may prefer to tie the wreath with a ribbon, the shade of which of course depends on the color of the flower.

Our second illustration is the same size and form of wreath as the first and is composed of a clump of Bridesmaid roses in the widest part, and white sweet peas for the rest. The arrangement speaks for itself and needs no explanation. The grouping can of course be varied; if pink or lavender sweet peas be used the roses should be white or light cream. Gypsophila, which is used as a fringe around the roses in this piece, is an old friend whose acquaintance, we are sorry to say, we have not cultivated very much of late years, for the reason that we so seldom meet him nowadays. This airy and graceful little flower is one of the most useful in an arrangement, particularly that of mixed flowers; it is not as much appreciated in this country as it deserves. In Europe, particularly Germany and France, this flower is deemed almost indispensable to the bouquet maker, and is therefore grown in large quantities.

Achillea is another very useful flower, and so is candytuft; even the common field daisy is not to be despised; mignonette is always useful, and pansies, either purple or blue, may be used advantageously. All these flowers in addition to a few roses (Mermets) are shown in our third plate. The photograph shows the combination of the different varieties fairly well, except the section of mignonette next to the roses on the left hand side. Such other summer flowers as hollyhock, aster, dahlias, etc. are not as well suited for such a style of arrangement as that we have been considering. These forms are better adapted for such designs as we shall attempt to illustrate later.

Miscellaneous Seasonable Hints.

You will scarcely have your chrysanthemums, roses, etc., planted and ready to take a breathing spell before the earliest bulbs arrive. Lilium Harrisii is delivered from several houses earlier this year I believe than ever. Unpack at once and if it is impossible to pot them right away put them in flats and cover with a little dry earth till you can get at them. Lilies, and for that matter all bulbs, are injured by remaining out of the ground any length of time, but lilies much more than tulips or hyacinths, so get them potted as soon as you possibly can. Early potting does not necessarily mean early flowering. You can retard them in several ways, if desired. For the largest bulbs (9 to 11 inches) a 7-inch pot, for 7 to 9 inches a 6-inch pot, and for 5 to 7 inches a 5-inch pot is about right. Still smaller bulbs can be grown in a 4-inch pot.

Everybody is allowed to change his mind; and sometimes it is a proof of wisdom. For two or three years I have grown small bulbs (5 to 7) in quantity for cutting and grown them in boxes about 18 inches square and 6 inches deep. I shall do so no more and find it better for the bulbs in every way to grow them singly in pots. You will get better results in every way. I must repeat that there is no better way to grow good lilies than to plant at once. Let the top of the bulb be even with the surface of the soil and the soil should be from 1 to 2 inches below top of pot. After a thorough watering stand the pots in a frame and then throw over them 2 inches of well rotted old hotbed manure. This will keep them from drying out daily in the hot sun, will save much labor and is better for the bulbs. When they are brought into the houses this loose manure can be shaken off and the pot then filled up with good compost. The plan above described is for the large Easter flowering bulbs. For smaller sizes that you intend to force and cut during winter you can pot in the usual way, but a slight covering of some mulch on them will help all round. The best lily soil is well rotted, light, turfy loam with a fourth of thoroughly decomposed manure of some kind, but not *fresh* of any kind. The half shell of the toothsome clam, concave side down, is perfection for drainage for lilies.

Roman hyacinths will soon be here. Get a few boxed at once. They are always very acceptable when they first come in. Another and larger planting can be made at end of August and the remainder can be planted end of September. Don't try to keep the bulbs out of the ground later than that or they will be injured. When boxed place them out of doors and after a very thorough watering cover with 3 or 4 inches of light soil, and don't let them suffer for want of water. In August and September, with the weather as it usually is, they want a small deluge every week. There has been a good deal of money lost the past few years in Romans. The price of bulbs with most people is still high enough, while the flowers sell for one-fourth what they did 10 years ago. For a man who grows for his own store, or retails, they are indispensable, but unless you have an ideal cold storage house of your own they are difficult to handle and have in good quality after February. In fact they don't pay after that date. The white miniature Dutch hyacinth takes their place nicely. It's a cheaper bulb, winters with much less trouble, stands any amount of freezing and comes in for Easter or late winter in good shape. Now please don't go and put your Romans,

WREATH OF SWEET PEAS.

FUNERAL WREATHS OF SUMMER FLOWERS.

narcissus, tulips, etc., into those brutal boxes that I still see even in establishments that have a reputation as big bulb growers. You see boxes 3 feet by 1 foot and 6 inches deep, another 2 feet 6 inches square. They think this is a saving because the groceryman at the corners says "take them along my boy." Get rid of the barbarous boxes and make your flats all one size. The words of even as small a man as myself should be heeded in this matter. I have more than once recommended the size I think best; it is 2 feet long, 12 inches broad, and 3 inches deep, made of 3-inch strips of ½-inch stuff, with the ends of 1-inch stuff. This box holds 50 Von Sion, 60 Yellow Prince tulips, or 72 La Reine.

Keep your show pelargoniums growing in a partially shaded house. They should now be making good growth which will give you cuttings later on, of which I will write later. It is a fine plant and has been much neglected for some years. The finer sorts such as Mme. Thibaut and Mrs R. Sandiford will pay well to grow for cut flowers.

Sow some pansy seed end of this month for winter blooming; don't sow a mixture, a good purple, a yellow and a white is what you want. A mixture is all right for spring sales but not for cutting.

You will be thinking how best to support your chrysanthemums and roses this fall and winter. A plan pursued by Harry Dale, and perhaps by many chrysanthemum growers, is to stretch a wire across the bench (No. 20 or 22 is large enough) and nail a little block on the side of the edge board to keep the wire above the soil. On the roof have a wire immediately above it, and from every plant tie up a common string from top to bottom. This is just as good as the best stake or expensive steel rod and a great deal better. Don't use the common white twine that grocers use. There is a brown string sold that is much cheaper, however, and will answer all purposes. When you get your crops cut, either mums in December or roses in May, you can take a scythe or sickle and chop them off top and bottom. The wire which was on the surface of the soil can be easily raised up and temporarily suspended from the roof while you are removing the bench, and if the bench is used for plants can be left there for an indefinite time. I am encroaching on other people's ground, but I have not before noticed this very important and simple way of supporting two important plants.

WM. SCOTT.

Carnation Notes.

In the FLORIST of June 28 is a photograph of a bunch of fifty Grace Wilder carnations; and in the text relative to them the writer says, "Carnations, if cut with plenty of buds and on long stems, look best set in a proper vase with no other addition than their own foliage." This is a point I tried to make a few years ago, that carnations should be cut with buds, and that their own foliage should be the only addition to them for vases or wherever they are used without adding other flowers. If we could get the public educated to use them in this manner I fully believe there would be an increase in the demand for carnations of at least twenty per cent. The only thing necessary to educate the public taste to this method of using them is for the retailers to present them to their customers in this shape and charge accordingly. The foliage could be grown in cheap houses and with out very much heat (which would make it all the better) and could be put on the market at a fair profit to the grower for fifty cents per hundred. If the retailer is getting say fifty cents per dozen for a certain carnation he could without any trouble get seventy-five cents by adding a dozen or fifteen sprays of foliage, and this would be giving him his average percentage of profit, and at the same time give his customer a much more satisfactory bunch than the way they are usually sold.

Although carnations are prettier with some buds, these are not an absolute necessity if there is plenty of foliage. The cry for the past few years has been for size, and one way to obtain size is to disbud them. These disbudded monsters on long stems, barren of buds and almost of foliage, are pitiful sights indeed to the true lover of flowers, but if their nakedness is screened by foliage they become a thing of beauty and a joy forever.

As most carnations are now cut with stems ranging from fifteen to twenty inches long we would have to look for correspondingly long foliage. Varieties of the Mrs. Ferdinand Mangold and Annie Pixley type would about fill the bill, as they make good long shoots before throwing out a bud. Grace Wilder and Portia both make good foliage for use where it need not be so long. After growing carnations for foliage for a season or two we would no doubt find varieties that would fill the bill exactly.

To some these may seem visionary ideas, but I would like to see the retail men try it as an experiment on a small scale, and there is no question that if it is called for the foliage will soon become a commercial commodity as well as the flowers, and competition would be quite as keen to have it in good salable shape.

ALBERT M. HERR.

Carnation Rust Experiments.

ED. AM. FLORIST:—The accompanying experiments were performed by me during the months of May and June in order to ascertain the approximate strength of the chemicals used that would prevent the germination of the uredospores of the carnation rust (Uromyces caryophillinus).

The work was performed as follows: A glass ring about ½ inch in depth and of about the same diameter was cemented to the glass slide; a few drops of water were placed in the cell thus formed, then to the cover glass was depended a drop of the solution, in which some spores had been mixed, then the cover glass was sealed to the cell by means of vaseline. The slide was then examined under the microscope to see that the mount was properly done, after which it was placed in a closed germinating pan, which was also kept moist. Examinations of the slides were made at different times during a period of from 12 to 24 hours. It was found that good healthy spores would germinate in water in the course of two hours. A great variation was found in

the germinating power of spores. Spores taken from good healthy plants were much more vigorous and would germinate in a stronger fungicide. To this fact is due some of the wide variations obtained in the experiments. In all cases where the strength is indicated by figures it means 1 part by weight, as, for instance, 1-100 would mean 1 pound of the chemical to 100 pounds of water.

Eau Celeste, or the formula recommended by you in the FLORIST, if figured down to the basis of 1-100, would be .035 lb. of CuSO4, or .035 grm. to 100 c. c. of water and the ammonia would be .25 c. c. (assuming a barrel of water to contain 50 gallons). You will readily see that even 1-500 was a much stronger solution than this and yet it was a failure, or 1-1000 is much stronger.

Bordeaux Mixture was made according to the standard formula 6lbCuSO4, 4lb lime and 22 gallons water.

⅔ strength CuSO4, 4lb lime and 33 gallons water.

½ strength CuSO4, 4lb lime and 44 gallons water.

Ammoniacal copper carbonate was made by taking an optional number of volumes of ammonia, strength 26° Beaumé, and reducing it seven times, i. e., to one volume ammonia, add six volumes of water. To this diluted ammonia was added an excess of copper carbonate; when the solution was thoroughly saturated with the copper it was poured off; it was then reduced fifteen times, i. e., 1 vol. saturated sol. to 14 vol. of water; ½ strength meant reducing it 1-29; ⅓ stronger meant reducing it 1-10.

Plants were sprayed with several of these chemical solutions in order to see if it would be injurious to them.

Iron sulphate 1-500, 2 plants sprayed. No injurious effects.

Lead acetate 1-500, 2 plants sprayed. No injurious effects.

Corrosive sublimate 1-500, 2 plants sprayed. No injurious effects.

Salt 1-500, 2 plants sprayed. No injurious effects.

Potassium sulphate 1-500, 2 plants sprayed. No injurious effects.

Potassium chromate 1-500, 2 plants sprayed. No injurious effects.

Potassium bi-chromate 1-500, 2 plants sprayed. No injurious effects.

Copper sulphate 1-500, 2 plants sprayed. No injurious effects.

WM. STUART.

The Trade Exhibit.

Since my last communication in this connection fifteen additional entries have been received, as follows:

J. C. Vaughan—plants, bulbs, etc.
C. H. Joosten—bulbs, fostilte, bellows.
Wm. Tricker & Co.—aquatics.
Storrs & Harrison—roses.
Siebrecht & Wadley—plants.
John N. May—plants.
Edwin Lonsdale—plants.
Major Bonaffon—patent fence.
L. B. Brague—ferns, etc.
S. A. Weller—jardinieres.
A. H. Hews & Co.—pottery.
Wisconsin Flower Exchange—plant tubs.
E. A. Ormsby—ventilating apparatus.
Thomas Woodason—patent bellows, sprayers, etc.
Herendeen M'f'g Co.—boilers, etc.

These with the 28 entries already reported make 43 in all, which is a gratifying proof of the continued popularity of the annual trade display. In St. Louis last season the total entries were only 34.

The space at this writing (July 21 '94) is now all taken with the exception of a few feet here and there, and this notwithstanding that some more space has been added by the removal of the athletic apparatus in the hall and by abandoning the idea of having a cross passage in the center. This latter plan would doubtless have been convenient, but had to go, owing to the pressure for space.

It has been decided to make the wide (8 feet) center table running the entire length of the hall 18 inches in height, this being deemed the best height for the proper display of palms, crotons and other decorative plants. All the other tables will be 2½ feet in height and 4 feet in width. The hall is well lighted from both sides and there will be no trouble about insufficient light anywhere.

For further information address the undersigned at 1025 Arch street, Philadelphia.

G. C. WATSON, Sup't Exhibition.

Are They First-Class Plants.

The inquiry we published with illustration in our issue of July 12 has brought out quite a number of replies. They agree so unanimously in classing the plants as culls that one is almost a repetition of the other. We will wait till the returns are all in and then record the number of votes. An amusing feature of the various letters is that the writer of nearly every one names a firm that he thinks the plants came from, having himself received just about such plants as we illustrated. And curiously the firm from which the plants did come has not yet been named; from this it would appear that there are more than one or two firms who have shipped plants that were unsatisfactory. We would advise all shippers to give a careful reading to the series of articles on packing plants that are now appearing in the FLORIST. We propose to so thoroughly cover the question of packing that none can plead ignorance of the methods of packing that will insure arrival of plants in good condition.

Coal Tar.

The advice of one of your correspondents in relation to the use of coal tar on the boards on greenhouse benches is rather amusing to some of us around here, who have been using it for years on all wood which comes in contact with the soil whether in the walls or benches, without having noticed any bad results. Of course we do not put it on heating pipes or on boards where it will come in contact with the heating pipes.

A little incident came under the writer's notice in regard to the use of coal tar on benches which may be interesting, and I believe goes to prove that it is not injurious to vegetation. A bench was constructed of wet pine boards and painted with coal tar; the tar had not dried when the soil was put on; the bed was planted with parsley which grew luxuriantly all winter, but the consumers of the parsley complained that it tasted of coal tar, which was not pleasant, certainly, but had the boards been dry and the tar allowed to harden before the soil was put on the above result would not have followed. The only objection we see to its use is the trouble of applying it, and for

WREATH OF ROSES AND SWEET PEAS.

FUNERAL WREATHS OF SUMMER FLOWERS.

that reason refuse petroleum is gradually taking its place, being cleaner to handle and perhaps just as good. BEAVER.

Montreal.

Philadelphia.

As the time of the convention approaches renewed activity is noticed among the various committees; frequent conferences are being held, and everything points to a successful meeting. The distance to Atlantic City is the cause of some inconvenience, as when a committee man returns from a visit in quest of information he is invariably floored by almost the first question put at him by one of his fellows, and another visit is made necessary.

While there are no botanic gardens or beautiful public parks to interest the visitor to Atlantic City, there is that broad expanse of ocean with its crested waves always breaking on the shore, making an ever moving picture that even the oldest resident will ofttimes stop to admire. Those who can find no pleasure in any color but that of the ever restful green of the grass and trees of their favorite parks will surely be pleased with the beautiful blue of old ocean, which is only broken by the snow white crests which are at all times appearing and disappearing on its surface, or by the mirrored reflection of the fleecy clouds above.

On the land side of the city may be seen the broadest expanse of lawn to be viewed anywhere in this country; it stretches for miles, interspersed with small streams, miniature lakes and broad rivers or thoroughfares, as they are called here. In the spring and early summer this expanse is a beautiful green, like a sheet of velvety well kept lawn, but in the early autumn a change takes place and large discolorations give the meadows, as they are known here, the appearance of a brilliant sunset sky; this fancy touch of nature is somewhat hard on the lovers of the restful green, but it is very beautiful and attracts the attention and admiration of those who are fortunate enough to see it. Between this meadow and the ocean's beach upon which the city is built there is a river or thoroughfare which extends from the bay which empties into the ocean just north of the city, a distance of about eight miles to another bay. This body of water furnishes excellent sailing for parties who do not desire to go outside and risk getting seasick. There is also at times very good fishing in these inside channels. One of the chief amusements for the ladies is to go crabbing in these waters. The boat is anchored in a shallow place and a piece of meat or fish tied and weighted is thrown over the side; this is drawn up slowly when a tug is felt, and sometimes as many as two or three crabs are seen to be clinging to the bait. The crab net soon lands these in the boat and the bait is again dropped. The man with the net is a busy fellow on an excursion of this kind, as he keeps going from one part of the boat to another in answer to "Oh, I've got one, hurry up, he'll get away!" and sometimes all speaking at once, and then when emptying the net the crab happens to fall outside the box and goes scurrying among the fair fishers it is worse than a mouse, if anything could be more frightful.

To those who are not afraid of seasickness, the ocean is their proper place: here one is almost always sure to find good fishing, and if the blue fish are running he has rare sport indeed. Embarking at the inlet or mouth of the bay in one of the pretty little yachts always at the pier he is soon over the bar (sand) and on the bounding deep. A fleet of these fishing boats with their beautiful sails all set and bending to the breeze is indeed a grand sight.

Of course the principal attraction is the bathing. About ten o'clock in the morning the bathers commence to don their suits, and to those who have never seen men and women in their bathing suits the sight is a very interesting one. There is nothing immodest in the appearance of the average bather, yet their suits are so arranged as to afford a free and perfect movement while in the water. Some ladies who do not care to bathe like their appearance so well in bathing costume that they change their garments during bathing hours and parade up and down the beach and lay around on the sand sunning themselves, and seem to enjoy this hugely.

There are a number of large establishments with retiring rooms where bathing suits can be hired, 25 cents being the usual charge. The regular bathers have suits of their own, which are taken care of by the bath house where they rent their rooms. During the bathing hours there are boats just beyond where it is safe for the bathers to venture, warning the reckless ones and ready in case anyone's strength gives out to carry them safely to land. While there have been cases of drowning at this beach, it is very seldom that persons who take ordinary precautions are in the least danger. Intoxicated individuals or those who on account of their swimming abilities go into deep water and then get frightened are generally the sufferers. Bathing is a most exhilarating pleasure; thousands of people are to be seen in the surf at one time and thousands are on the beach looking on. By one o'clock most of the throng adjourn to their hotels for dinner.

The board walk, which extends the entire length of the ocean front and is about 20 feet wide, is next the scene of activity, and from four o'clock until long after dusk has set in this promenade is crowded with all the youth and beauty of the city; the crowds flock here to see and be seen. On one side of the promenade is the ocean and the pier, which extending out some 1000 feet, is a delightful place to while away a few hours. On this is also a large pavilion, with a fine orchestra, where those who so desire can trip the light fantastic. The main avenues, which run parallel to the ocean, are happily named; they are called Pacific, Atlantic, Arctic and Baltic, and the cross streets are named after the states of the Union.

Electric cars on Atlantic avenue run the full length of the city from the inlet at the upper end to the railroad excursion house at the lower end, for one 5-cent fare, and connection is here made with another electric line to Longport, some 7 miles further down the beach, for 5 cents more. This road is built as near the ocean as possible; the cars are all open, making the ride a delightful one.

All these attractions are to be seen by the average visitor in common with the members of the S. A. F., but when the advantages to be gained from the convention are considered what members are there who will go away saying they were not glad they came? And there has not been a word said about the bowling match; well, there will be something to say about this event next week, in fact we hope all about it. By the way, the "Bard" has been a bit off in his rolling recently, and the picture in last week's issue accounts for it; it is an excellent

likeness, and his whole manner illustrates most forcibly the energy he puts into everything he does, especially poetry. If we might suggest, when the "ode" is published would it not be well to have it illustrated?

There was a match at the alleys one night the past week which afforded some people a great deal of gratification. The "scrub" is a fairly good team, but then they can't keep up the pace, for they are only "scrubs." K.

Toronto.

The Electoral District Society's annual flower show held on the 18th, 19th and 20th inst. was as regards quantity and quality of plants the best that has yet been held. With such a lot of well grown plants of all sizes some grand effects might have been made if only a little taste had been displayed, but the same old style we have been accustomed to for ages past prevailed and no one appeared to have a soul above a clump or two of palms in the middle of the hall and a border of stove and greenhouse plants straight up and down each side, stood as called out in schedule order. I will acknowledge that it is a difficult job to do so much work in so short a time, but there are always willing helpers on hand and if only the superintendent had his plans well laid out beforehand and stuck to them the chaos would soon be reduced to order. As things are now exhibitors and their helpers are waiting about doing nothing half the time. One man I know of—there may have been more—had his exhibit at the hall at 8 a. m. and could not put it into position until 3:30 p. m. Surely in these enlightened days some better way of managing these things could be devised and carried out. It is not a pleasant duty for me to find fault but in face of general complaints on all sides I consider it right and in the best interest of all concerned that the matter should be ventilated.

After this little "divarshun" everything will be lovely and smooth sailing.

The judges of plants were Messrs. Wm. Scott and Wm. Belsey of Buffalo, and of cut flowers and designs Messrs. F. G. Foster, of Hamilton, and Professor Cowell, of Buffalo, and I am bound to say that this "*two* judge plan" appeared to work most beautifully all round, and I heard no remarks that could be twisted into the shape of a genuine kick. Of course in design work there is always room for difference of opinion and taste, but even there it was hardly possible for the judges to do otherwise than they did. And really I think some of this work was the best I have seen in this city, a large star on a base by Messrs. Tidy & Son being almost if not quite perfection in the art. This firm took firsts for three other designs and a bouquet of roses all put up in the best style, and yet strange to say I saw another bouquet of yellow and red roses made by this same firm tied up with a broad *blue* ribbon.

Dinner table decoration did not come out well, the first prize going to a centerpiece of Meteor roses and allamanda with the et ceteras—altogether too gaudy. The only other did not come up to schedule specifications and was ruled out, although in better taste.

Stove and greenhouse plants, ferns and palms is where Toronto comes out strong. The principal exhibitors were John Chambers, Exhibition Park; Wm. Houston, Central Prison; Geo. Reeves, Reservoir Park; Joe Graham, The Asylum; A. Macpherson, gardener to Col. Sweney; R. Marshall, gardener to Sir Casimir Gzowski; Manton Bros., Eglinton; Jno. Cotterill, Deer Park; W. J. Laing, Huron street; Mr. Chambers taking the lion's share of first prizes and Mr. Houston coming next. A big specimen of Maranta zebrina grown by Mr. Chambers was the largest, best grown and marked plant I ever saw; his fancy caladiums were also very fine, but placed in a very bad position; in fact all his plants exhibited this year were in the very pink of condition and reflect great credit on the man who cared for them, Mr. Fred Bromham. Mr. Houston's tree fern, Dicksonia antarctica, which was from the Australian exhibit at the World's Fair last year, was a great attraction; it has an 8 foot stem and a fine healthy head of fronds. His Sabal Andersoni palm which figured prominently in the Ontario exhibit at the Fair was also in evidence, but as it has reached the glass in the house where it is at home some of the leaves are slightly damaged, so that it had to take a second place. Many other old World's Fair friends were also to be seen. A specimen Bougainvillea speciosa about six feet high and five feet through in a 2-gallon pot, covered with bloom, was shown by Mr. Geo. Vair not for competition and was quite a feature.

The cut flower exhibit was very large and showy and the tables were always well patronized, the exhibits of sweet peas being specially attractive and beautiful. Mr. Scott brought over a magnificent lot of American Beauty roses and took a first prize with them.

The attendance was less than usual the first two days, owing probably to the extreme heat and counter attractions. Two days have formerly been enough but an extra day was decided on this year.

Mr. Jos. Spring, formerly of Toronto, now over the palm house at Schenley Park, Pittsburg, was a visitor and was warmly welcomed by the boys.

About 4,000 Baptists are in convention here now from all over the continent.

A spray of Cereus triangularis with four blooms close together on the one stem was a beautiful sight one night last week. E.

New York.

The long drought and torrid weather were checked, permanently it is hoped, by the coming of the welcome rain on Saturday afternoon, July 21. There was a steady downpour of water for a couple of hours, and a storm was never more welcome. The temperature, which had been holding up in the nineties for several days, took a sudden tumble, and has been behaving rationally ever since. The effect of the dry season on outdoor vegetation has been generally severe. Carnations, however, in the field seemed to revel in it, and reports from various directions show that carnations have never looked better at this date than they do this season, many growers asserting that the plants of some varieties are already as large as they were at the time they were taken into the houses last fall.

There is very little being done in the cut flower trade. For American Beauty, Meteor and the large white roses there is a fair demand, with prospects of increase, but for all other roses and all other stock there is no outlet at present. Pink roses are particularly slow. The only exception to this rule is Testout, which when good seems to find a fair market. But there are but few growers who are getting it good, and "when it is bad it is horrid." American Beauty seems to be the great summer favorite. That "it's an ill wind that blows nobody good" is well exemplified by the orders for Beauty which are beginning to come in from Newport, where the hail storm put a temporary quietus on the rose crop.

There is entirely too much stock being grown at present for the summer consumption. Five years ago there was not as much stock sent to this market in a whole week as comes in one day now. To show this it is only necessary to mention that on one day (July 21) there came to one firm (Burns & Raynor) no less than 22,650 roses and 8,660 bunches of sweet peas, enough to supply three or four cities it would seem. Sweet peas are despised and rejected even by the Greeks, who will not take them for a gift, hardly. Fifty to sixty cents per hundred bunches is about the best price they will bring, and there are twenty-five sprays in a bunch as a rule.

Ernst Asmus is one of the few growers who can and do grow and handle Testout so as to make it a desirable summer rose. He is very successful with it, and regards it as one of the best. His plants are full of buds with long and strong stems. His houses are all planted and ready for the coming season. Beauty, Testout and Meteor are the only varieties of which he has planted an increased stock. The beds which he prepared with so much labor and expense last year, with bottom heat and foundation of broken stone, have all been discarded and their place taken by regulation benches, to which Mr. Asmus proposes to confine himself in the future.

There is rejoicing in two of the leading retail stores just now. Thorley's cashier, Mr. Brown, found a pair of twins waiting to greet him when he went home the other day, and "Butler's boy" Joe of the second generation has arrived and settled down to business.

John A. Scollay has just completed and set up the first new boiler under his new patent. A new idea in hot water circulation has been introduced, which the manufacturers claim will prove a great advantage in greenhouse heating.

Burns & Raynor have added an immense safe to their office equipment as a proof of their faith in the future of the commission business.

Jas. Hart is giving his establishment a thorough renovating.

Chicago.

The rumors circulated the early part of the week regarding some impending failures had a most depressing effect on the market. We are sorry to say that these rumors were later proved correct by the suspension of two well known establishments, namely that of P. J. Hauswirth the middle of the week, and of J. T. Anthony, who made an assignment on Saturday last. We hope that the embarrassment of these two houses is only temporary, and that matters may be arranged for resumption at an early date.

Still there is nothing sufficiently alarming in the present state of affairs to call for heroic measures. The, we hope, temporary suspension of the last firm has positively no bearing on the wholesale trade, since the relation of this house towards the wholesale men was not that of a debtor, but on the contrary a creditor. Nevertheless wholesale men are extremely careful as regards the extension of credits, and in fact most transactions now are made on a cash basis.

The retail men on the other hand have been extremely conservative buyers for weeks past, and show no inclination to

WREATH OF MIXED SUMMER FLOWERS.

FUNERAL WREATHS OF SUMMER FLOWERS.

incur obligations. Few houses carry more than one or two hundred roses at most in stock. Under the present condition of trade this seems to be the wisest plan, but it doesn't buoy up the market and as a consequence things are exceedingly flat.

But even in the midst of the dullest season there is always a feeling of hopefulness which keeps the trade from total collapse. Just now everybody is looking forward towards fall and a consequent revival of business.

As a sign that not every one connected with the business takes a gloomy view of the situation we might note that such men as Bassett & Washburn and a number of others which we shall mention later have made extensive improvements in and additions to their establishments. This firm has added ten more houses to their already extensive plant. These houses were built early this spring and are devoted to roses. All the houses are 20 feet wide and about one-half are 125 feet long and the rest 170 feet. In addition to the above seven more houses will be built this summer. This last addition is intended for the growing of summer roses next season. With these houses complete this establishment will figure up the respectable total of 200,000 square feet of glass, devoted almost exclusively to rose growing.

Mr. Phil Schuetz will soon build at Ravenswood a range of five houses, each 125 feet long, for vegetable growing. The plant will contain 12,000 feet of glass.

Mr. W. L. Morris of DesMoines, Ia., was in the city last Monday and Tuesday.

Buffalo.

If the business hasn't improved the weather has, and the torrid spell has broken. We have been better off than some cities, for we have had a good rain just about the time we were ready to grumble. There is little doing except for departed friends. The untimely death of our late postmaster called for some elaborate pieces of floral work last week.

Lilium auratum and L. lancifolium in variety are getting plentiful, and very useful they are, and up to date none going to waste. There are still some fine carnations coming in from Corfu, Lancaster, and Hamburg. The variety Wm. Scott is easily the best of them, and has proved to be not only an early bloomer but continuous. A bench of it at Corfu holding only 375 plants has flowered from October 1 up to date. When last the writer saw it, about July 11, the bench was a sight. Plants as green as at Christmas, flowers 2½ inches across, with stems 30 inches long, and standing up as thick and stiff as a field of rye, and so it has been since it was planted. I have no interest in extolling the good qualities of this wonderful variety beyond letting my brethren know of them, for comparatively few grew it this past season. Fifty of them were sent to the Toronto flower show the past week to compete for a prize, and there was nothing near it, and they grow good flowers in that neighborhood too. Anyone who will persist in still growing Grace Wilder the next season must do so out of prejudice or ignorance.

There was a mixed delegation of Buffalonians over to see the mid-summer show in the beautiful city of Toronto. They comprised Mr. and Mrs. C. F. Christenson and several lady friends, Prof. Cowell, Wm. Belsey and W. S. In fine plants the show was most excellent. Ferns, palms and general stove and greenhouse plants especially. The display of fruit though not large, was fine. In designs and cut flowers the exhibits were scarcely up to former years. But if there were no flower show the ride across the placid bosom of Ontorio and the hearty welcome of the Toronto men and its concomitants are worth far more than the journey costs. We were Vair-ry sorry to leave them, but business called us home.

Mr. Samuel Burns, manager of the Thomas W. Weathered's Sons firm was here last week; we were greatly pleased with his exposition of now to heat a greenhouse, and believe he knows how, and in his informal talk he makes you think you are attending a Scotch picnic.

The Niagara Hotel has again changed gardeners. They are building six or seven fine houses. Lord & Burnham are putting them up, which guarantees they will be "about so." Mr. Lewis has had fourteen gardeners in eight years, and if he had Sir Joseph Paxton he would have been pronounced "incompetent" after a few months. A Mr. Fitzpatrick from the east is the latest incumbent, and we will give him the usual time, about six months. We wish him better luck, and trust he may have it, but, 'tis hoping against fate.

W. S.

Baltimore.

There was such a slim attendance at the last club meeting that a motion to meet only once a month until October met with no opposition whatever. The whole character of the meeting was rather listless, and no one seemed to care to enter into a debate of any kind. The nuptials of Mr. Thos. Patterson and Miss Vanzant were discussed, and all united in wishing them a happy and prosperous future. The announcement of a similar occurrence in the near future near Belair and North avenues excited some surprise, as the groom in prospective, from some unknown reason, was not looked upon as a candidate for hymeneal honors.

Business is very slack, and perhaps the boys have not enough to do to keep them out of mischief, hence these breaks in the ranks of the bachelors.

Mr. C. G. Hahn, of 1345 South Charles street and North Eutaw street, is erecting greenhouses at Embla Park.

Mr. M. A. Hantske has leased several lots near Govanstown and will remove his entire business from Hampden shortly.

Mr. Chas. Feast has been taken into the firm of Sam'l Feast & Sons as partner.

Sales of plants are not, and the sales of cut flowers that are, are very few and far between, to say nothing of the prices, which are very low.

As the club has taken no action to secure rates to Atlantic City a number of the members are working up a little excursion of their own.

Mr. E. A. Seidewitz has moved to No. 36 W. Lexington street, a few doors east of his old stand.

There seems a hopeless difference of opinion on the spring plant trade, one member of the club claiming it was better than last year. The majority hold a different view though, and some even put the falling off as high as 20 or 25 per cent, which is doubtless an extravagant figure, as 10 per cent would mean a very serious reduction in one's gross sales.

There are rumors about already of a rival chrysanthemum show again this fall.

MACK.

Sweet Peas Under Glass.

We present herewith engravings from two photographs sent us by Mr. Fritz Bahr, of Ardsley, N. Y. Regarding the photographs Mr. Bahr writes:

"The first picture represents a day's shipment of 1,800 cut blooms of Blanche Ferry cut from a bench 8x60. The second picture shows a bunch ready for market. The seeds from which these plants were grown was planted on the 6th to the 9th of October, 1893, in 3-inch pots, placing about three to four seeds in a pot. The pots were kept in a deep cold frame until December 10, when the little plants were planted out in benches, three inches apart in rows and eighteen inches between rows. The first flowers were cut April 2, and from that date they kept on blooming until the first ones from the outside were ready to be cut. I gave the new sweet pea Emily Henderson a trial inside but cannot see any difference between that kind and the Queen of England. Butterfly does very well for forcing, but for all round work I should say that Blanche Ferry beats them all."

BUNCH OF BLANCHE FERRY SWEET PEAS.

Boston.

This part of the country is experiencing the most severe drought on record. The entire rainfall since June 1 would not make more than one good shower altogether, and all outdoor vegetation is suffering greatly. Many large trees are dropping their leaves and the foliage on others is shrivelled up on the stems, while the grass everywhere is as brown as it can be. Unless a change comes very soon the loss on trees, shrubs and fruit will be heavy.

The extreme dullness heretofore noted in the flower business still continues. While the quantity of stock coming in is very small it is still far more than the market requires. It is kept in the refrigerator for a while and then much of it goes to the dump. A few asters are beginning to come in, but with an abundance of fine carnations in the market there is but little demand for them.

Mr. Warren Ewell and family are sojourning for a brief period at "The Breakers," Mr. Ed. Hatch's cottage by the sea at Scituate. With characteristic generosity Mr. Ewell invited a number of his florist friends with their wives to spend a day with him. The occasion was in all respects commensurate with Boston's reputation for such jollifications. Everybody agrees that Warren "knows how to do it."

Miss M. S. Newman, formerly of Boston, but now of St. Louis, is here for a few week's vacation, accompanied by Miss Armstrong, daughter of Luther Armstrong of St. Louis. This is Miss Armstrong's first visit to the Hub, and she is evidently enjoying the delicious experience to the fullest extent.

Another case of first experience was that of Mr. John Raynor and wife of New York, who honored us with a one day's visit on July 19. John promises to stay longer next time.

Flatbush, Long Island.

With the thermometer ranging from 97° to 100° in the shade, the ground parched up and mosquitos abundant and voracious, the lot of the Flatbush grower has not been of the pleasantest description recently, and his regular hourly task of hunting the goats off his preserves has been performed with less than usual amiability. In spite of these drawbacks, however, the Flatbush boys have found time and inclination to make extensive preparations to put a bowling team into the field, which it is expected will be able to give the contestants at Atlantic City a shaking up which will not be forgotten.

Mr. P. Bruno Meissner has gone with his family to the Catskills, and it is pleasant to know that his health is rapidly improving. Mr. Gus Bergmann has just returned from the same resort. This gentleman did not take his family with him. Flower business being dull he is temporarily interested in saddle horses.

J. A. Sedam, formerly engaged in forcing vegetables, has joined the ranks of the flower growers, and his houses will hereafter be devoted to the cultivation of roses, carnations and violets. His soil is is said to be the finest in Flatbush; certainly finer carnations were never seen in the field than his are today. An electric pump with a capacity of 1200 gallons per hour supplies water for this establishment.

Dailledouze Bros. found their yellow carnation Baron Rothschild (Bouton d' Or) exceedingly difficult to propagate at the end of the season, and were unable to fill a large part of the late orders which came in for rooted cuttings. This variety has been noted as a slow propagator before.

The only greenhouse building in Flatbush this season is being done by Dailledouze Bros. and Wocker Bros., they each having rebuilt one house.

Geo Bennett has between 30,000 and 40,000 fine carnations in the field.

St. Louis.

Everything remains quiet, there being nothing outside of funeral work being

A DAY'S CUT OF SWEET PEAS FROM A BENCH 8X60.

done, and as a result only white and light flowers are called for, and that in very limited quantities.

A. Y. Ellison, during the absence of his father in the east, has given the store an overhauling and has everything re-arranged in excellent shape for the coming season. He reports that the largest order heard of for some time was one filled by Mr. Alex. Waldbart recently. The committee appointed by the Bowling Club have purchased six new balls and will have them on hand for the bowling contest at the Highlands. The picnic to be held there on the 25th from present indications promises to be a most successful affair. The prizes are as follows: Hat, value $3.50; gold scarf pin, croquet set, cane, gold link cuff buttons, 2 pocket knives, league ball and bat, silver cake stand, fan, and for the bowling contest—highest individual score, gold watch chain; highest average, silk umbrella; lowest score, pair silver buckle garters. R. F. T.

Pittsfield, Mass.

The regular meeting of the Berkshire County Gardeners' and Florists' Club was held on Thursday evening, July 12, and was well attended. Considerable business was transacted; the constitution and by-laws having been revised and altered, were approved by the club. Two new members were elected, and two new names were proposed.

A letter was read from the Lenox Horticultural Society inviting the members of the club to Lenox on Saturday evening, July 21, to help them celebrate the occupancy of their new hall, and to have a good social time generally. The invitation was accepted by a hearty vote of thanks to the Lenox Society for their kind invitation.

Two of our promising young members, Mr. Gordon McArthur and Mr. Ernest Bennett gave the club a pleasant surprise by providing a very substantial lunch, and good cigars in abundance; besides this Mr. McArthur amused the members by reading a very humorous letter from his cousin in Ireland. Considering what dry sticks we are here as a general thing, it is supremely funny to witness how ridiculously laughable we become when touched in the right spot.

Vice-President White gave a very interesting talk on the old fashioned way of growing chrysanthemums and the method of renewing and replenishing the English conservatories with a constant show of seasonable flowering plants. A hearty vote of thanks was accorded Mr. McArthur and Mr. Bennett for their entertainment. W. M. EDWARDS, Sec'y.

Cleveland.

Some of the growers will begin housing their carnations next week, which are looking very fine this early in the season, especially Daybreak, which takes the lead in sturdiness and rapid growth. All varieties are promising and the outlook for a good crop of flowers in the early fall is encouraging. Last year nearly all the florists in this section were behind hand with their carnations, in consequence the first good crop of bloom was delayed till the middle of December.

The first shipments of Harrisii has been received some time ago and planted. This is much earlier than usual, and the chances are that all of us will be well supplied with lilies next Christmas, and prices take quite a tumble. Last year there was only one or two growers who were fortunate enough to have Harrisii during the holidays, the result was the wholesale price was fixed at $20 per hundred and counting every small green bud at that. With one voice every florist declared he would have Harrisii next Christmas, and so they will.

At the Edwards–Otis wedding recently a neat house decoration was done with plants of adiantum, the walls and mantels in places being banked from floor to ceiling, relieved in places with bunches of white Japan lilies. The effect was cool and pleasing for a mid-summer wedding.

In the trades display in the procession on the Fourth the florists of the city were in line with a large float highly decorated with plants and cut flowers representing floriculture. L. F. D.

Kansas City, Mo.

Mr. G. M. Kellogg of Pleasant Hill has just completed a new range of houses of which two houses 19x100 are devoted to Beauties, one 19x100 to Brides and Bridesmaids, one of same size to Daybreak carnations, three 10x100 to violets, two 10x100 to chrysanthemums, and one of same size to hybrids. The old range consists of 12 houses of roses, one of carnations, one of smilax, one of palms and ferns and several small houses for forcing bulbs. Mr. Kellogg heats by steam, using four boilers, of which two are 40 and two 30 horse power. Including his new range he now has a total of about 60,000 feet of glass and has been in the business only five years. Mr. Kellogg is also in the ice and vegetable business very extensively, besides owning and operating a large canning factory. His next move, he says, is to have about five acres of bottom land made into a large pond, and stock it with fish, so that he can invite his friends to a little fishing. He also says that he is going to Atlantic City to have a good time, as are also some of the Kansas City boys.

S. MURRAY.

Coming Exhibitions.

ATLANTIC CITY, N. J.—Trade exhibition Society of American Florists. G. C. Watson, Sup't of exhibition. 1025 Arch St., Philadelphia, Pa.

LENOX, MASS., Sept. 4-6. Annual exhibition Lenox Hort. Society. A. H. Wingett, Sec'y.

BOSTON, Sept. 5-6. Annual exhibition of plants and flowers Mass. Hort. Society.

SPRINGFIELD, MASS., Nov. ——. Chrysanthemum show Hampden County Hort. Society. W. F. Gale, Sec'y, 23 John St.

MILWAUKEE, WIS., Nov. ——. Chrysanthemum show Milwaukee Florists' Club. A. Klokner, Sec'y, 219 Grand Ave.

HAMILTON, ONT., Nov. ——. Chrysanthemum show Hamilton Agric. Society. Walter H. Bruce, Sec'y.

[Secretaries will confer a favor by supplying dates as soon as decided upon. We shall be glad to know of any further shows decided upon and not included in our list, even if exact date is not yet determined.]

News Notes.

OCALA, FLA.—Mr. P. J. Hjort, the florist, will soon remove to Thomasville, Ga.

WILLIMANTIC, CONN.—J. C. Bill is building a new house, 100 feet long, on Cottage Place.

WINCHENDON, MASS.—James Sutherland, Jr., is making extensive additions to his greenhouses.

PITTSBURG.—A. M. and J. B. Murdoch are building two 7-foot lean-to additions to one of their 150-foot houses.

CHAMPAIGN, ILL.—On the 9th inst. Mr. and Mrs. Thos. Franks celebrated the 25th anniversary of their marriage.

DES MOINES, IA.—We have had no real good rain since April and the country is all dried up. Crops are seriously injured.

NEWPORT, R. I.—In last issue the loss of M. Butler & Son by hail should have been printed 1,500 lights of glass and not 15,000.

MONT CLAIR, N. J.—Edmund Williams, the well known horticulturist and president of the N. J. State Horticultural Society died July 12, aged 64 years.

QUINCY, ILL.—An effort is being made to secure the passage through the council of an appropriation of $5,000 for the creation of a park for the south side.

Hotels at Atlantic City, N. J.

The committee have obtained from the United States, the largest hotel, a special rate of $2.50 per day for each person where two or more occupy one room, and $3.00 a day with one person in a room, and a guarantee that they can accommodate 400 guests. From at least one-half the rooms there is an ocean view, and broad piazzas surround the hotel, from which can be seen an ever moving panorama. There are also many other hotels and cottages who have promised the committee they will make room for the delegates, which list, with prices, is given below.

NAME.	PROPRIETOR.	SITUATION.	CAPACITY.	RATES PER WEEK.
Albemarle,	C. E. Cope,	Cor. Virginia & Pacific Aves.	150	$8.00 to $14.00
Amole,	Mrs. S. C. Amole,	21 South, South Carolina Ave.	40	8.00 to 12.00
Ardmore,	Mrs. Story,	166 South, Virginia Ave.	125	8.00 to 12.00
Baltimore Villa,	Mrs. Hallahan,	120 South, Tennessee Ave.	40	8.00 to 12.00
Belleview,	Mrs. McClure,	Ocean End New Jersey Ave.	100	10.00 to 15.00
Brevoort,	Mr. Norris,	18 South, South Carolina Ave.	60	8.00 to 12.00
By-the-Sea,	"	Cor. Mass. & Pacific Ave.	50	8.00 to 12.00
Carlyle,	Mrs. Hotine,	102 South, So. Carolina Ave.	150	8.00 to 12.00
Clifton,	Mrs. Cope,	Cor. Atlantic & Conn. Aves.	50	8.00 to 12.00
Edgewater,	Miss Parkenson,	123 South, So. Carolina Ave.	50	10.00 to 12.00
Castlemere,	Mrs. M. Muldune,	106 South, So. Carolina Ave.	30	8.00 to 12.00
Epworth,	M. M. Downs,	121 South, So. Carolina Ave.	40	8.00 to 12.00

Wiltshire,	E. L. Chandler & Co.	South Virginia Ave.	150	15.00 to 25.00
Lehman,	Miss Lehman,	114 South Penna. Ave.	200	15.00 to 20.00
Lelande,	S. Waguer,	Mass. Ave. and Ocean,	150	15 00 to 25 00
Louella,	Mrs. Carver,	138 South Tennessee Ave.	40	8.00 to 12.00
Monterey,	E. K. Newcomet.	Virginia Ave. Ocean End,	100	12 00 to 20.00
Ocean Villa,	Mrs. Scherubergen,	So Carolina & Pacific,	50	8.00 to 12 00
Park Cottage,	M. B. Walker,	1302 Pacific Ave.	30	9.00 to 12.00
Raymond,	Mrs. M. D. Evans,	South Virginia Ave.	75	12 00 to 18.00
Saratoga,	Mrs. S. A. Haines,	South Carolina Ave.	40	10 00 to 12.00
Upton,	Mrs. Fothergill,	South Tennessee Ave.	50	8 00 to 12 00
Vinedole,	Mrs. Frambes,	South Pennsylvania Ave.	40	8.00 to 12.00
Windsor,	G. Waters & Son,	South Illinois Ave.	250	18 00 to 30.00
Fraymore,	W. W. Green & Co.	South Illinois Ave.	250	18.00 to 30.00
Brighton,	F. Hensley & Son,	South Indiana Ave.	300	20.00 to 35.00
Dennis,	Joseph Barton,	South Michigan Ave.	500	18.00 to 30.00
Shelburne,	J. W. Southwick,	South Michigan Ave.	200	18.00 to 30.00
Haddon Hall,	Leeds & Lippincott,	North Carolina Ave.	250	18 00 to 30.00
Chalfonte,	Mrs. Roberts & Son,	North Carolina Ave.	250	18.00 to 30.00
Kenilworth,	Mrs. Grubb,	Kentucky Ave. Beach End,	150	15.00 to 20.00
United States,	J. S. Davis,	Maryland & Pacific Aves.	Special rate $2.50 & $3.00 per day.	
The Stratford,	(European plan),	Beach End Kentucky Ave.	$1 50, $2 & $2.50 per day; 65 rooms.	

SAGINAW, MICH.—The Union street railway has decided to create a public park on its line, and expend $15,000 on same, with the object of stimulating traffic.

TAMAROA, ILL.—The Tamaroa Nursery Co. has been incorporated with a capital stock of $5,000. W. H. Arndt is president and Clyde Curlee secretary and treasurer.

MADISON, WIS.—The Madison Nursery Co. has been incorporated with a capital stock of $10,000. The incorporators are J. A. Tormey, Chas. Nelson and B. M. Bruce.

HARRISBURG, PA.—Mrs. Sarah Badger, widow of the late William E. Badger, has left the city, leaving many debts unpaid. Quite a number of the florists are caught, some for considerable sums.

DELAWARE, O.—Mr. Jas. H. Cunningham, the florist, is now president pro tem of the city council and is also chairman of the council finance and city hall committees. He represents the second ward.

SCHENECTADY, N. Y.—The *Schenectady Reflector* of June 28 gives a description of the establishment of Mr. J. E. Felthousen the florist, from which we learn that Mr. Felthousen has over 15,000 feet of glass and that he is also quite heavily in fruits, having 8 acres devoted to fruit.

WILMINGTON, DEL.—Spring plant trade was about one-fifth less than last year. Average retail price of 4-inch geraniums was $1 a dozen. Collections about as usual. Plants sold very cheap this year. Mr. Isaac Baylis has started in the business and is building some houses.

DANVILLE, ILL.—Mr. P. G. Walker has bought the Maple Hill Floral Co's. greenhouse and grounds and will continue same under the title of Logan Avenue Greenhouses, with Mr. B. E. Wadsworth in charge. Specialties will be made of new pelargoniums, ivy leaf geraniums and carnations. They are putting in a large steam pump to supply water for greenhouse and land.

BRIDGEPORT, CONN.—Spring plant trade was about 10% less than last year. Average retail price of 4-inch geraniums was $1.00 a dozen. More call for geraniums and cannas and less for foliage plants. Collections fair. There has been considerable cutting in prices. S. E. Banks has opened a floral store at 318 Main street. The Lomel Floral Co., which started up last winter, has failed.

DAVENPORT, IA.—Referring to the building operations of Mr. Chas. Dannaeher it should be added that the houses are all completed and in fact were finished and planted last May. The short-span-to-the-south house is 20x200, the other is a continuation of a house 20x100 with three quarter span, the long span to the south; another house is 9x200 with glass partition in center and piped so as to regulate the heat in each division. Mr. Dannaeher has also sunk a deep well and got in soft water. He has a pump that lifts 60 gallons a minute into a tank 20 feet high.

Detroit.

J. Noel, late of Holznagel & Noel, is now located at Woodmere P. O., in the suburbs, where he is engaged in growing for the Detroit market.

Among Detroit florists who contemplate adding to their plant this season are Benrd Bros., Fort street, west. Andrew Ferguson will erect a branch office on Willis avenue, in addition to his main establishment on Farnsworth street.

Belle Isle Park is wonderfully improved this year, and is a breathing place of which the city is entitled to be proud. To those remembering the swampy, unkempt look of the place a few years ago the change is wonderful. There is some good bedding in the neighborhood of the

VIEW OF THE ROSE HOUSES OF F. R. PIERSON CO. AT SCARBOROUGH, N. Y.

bathing pavilions and casino, but the greater part of the island is to be purely natural, and as much of it is heavily timbered with very fine trees the result is extremely beautiful. A system of lagoons or canals, extending the length of the island, spanned by rustic bridges, and dotted with tiny islets, is cleverly carried out; the little islands are all to be planted naturally. Supt. Ekstrom is to be greatly congratulated for the improvement effected within a comparatively short time.

Famous Orchids.

A writer in the London *Graphic*, speaking of costly orchids, mentions fifteen plants in various collections which may be roughly calculated as representing a value £2000 or $10,000. These are—"1, Masdevallia Harryana Gravesiæ, belonging to Mr. Graves, Orange, New Jersey, U. S. A., and for which he is said to have a standing offer of 500 guineas; 2, Cypripedium S'ouei platytænium, of which at various times Baron Schröder has bought pieces for £106, £159 12s., and £100, and Sir Trevor Lawrence and Mr. W. Lee bought one in partnership for £147; 3, Cypripedium insigne Sanderiana, still unique, of which bits have been sold for 72 guineas, 100 guineas, and 250 guineas; 4, Odontoglossum crispum, Burford variety; 5, Odontoglossum Pescatorei Veitchianum in the possession of Baron Schröder; 6, Dendrobium Williamsianum; 7, Vanda cœrulea; 8, Odontoglossum Williamsianum, probably a natural hybrid between O. grande and O. Schleiperianum; 9, Dendrobium Sanderæ, beyond price as yet; 10, Vanda Lowi; 11, Aërides Lawrenciæ, for which Sir Trevor Lawrence paid 260 guineas at auction; 12, Saccolabium Heathi, an albino of the Fox-brush Orchid, which Mr. Lee sold to Baron Schröder for 157 guineas; 13, Cattleya Mendeli Blunti; 14, Cattleya Parthenia, an albino of C. intermedia; and 15, Cattleya speciosissima Sanderiana, for which Mr. A. Wilson of Sheffield paid 100 guineas."

News Items.

Subscribers are requested to report to us anything of trade interest that may take place in their vicinity. Where they happen to be nearer to the following points notes may be forwarded to our correspondents there, the name and address of each being given below:

Address THE AMERICAN FLORIST CO., Chicago.

HORTICULTURE VS. ENGINEERING.

It seems to us that it behooves our national organization to take some steps looking to the placing of horticulture upon its proper level with the other professions, for instance, that of engineering. It is a notorious fact that in considering plans for the laying out and maintenance of parks and public gardens the voice of the engineer has far more weight than that of the horticulturist. That this is fundamentally wrong we believe every one in the profession will agree.

We are willing to concede to the engineer that his work is of very great importance, but we must still hold that the work of the horticulturist is of even greater value in the creation of a park or garden that is to be what its name implies. The profession of gardening has yet to make a considerable advance in the estimation of the general public before it receives the consideration to which it is entitled. People who are ready to accord due honor to the work of the engineer are altogether too apt to belittle that of the gardener. They tell you that to produce a competent engineer requires a technical education that can be thoroughly acquired by comparatively few men. They make a very decided distinction between engineers of ability and those of a lesser degree of merit, but in the case of the gardener nine times out of ten the whole profession is placed upon one common level, and that level is generally that of the alleged gardener who mows the grass and mutilates the trees and shrubs on the grounds of the gentlemen composing the committee to pass upon the merits of horticulture as compared with that of engineering in the creation of public parks.

It seems to us that something can be done through our national organization to educate the general public to an appreciation of the thorough technical education required to produce a really first-class gardener. Referring particularly to the creation of public parks and gardens, does it require any more technical skill to carry out the engineering than the planting, which requires the planter to see in his mind's eye the picture that the landscape will present, not only immediately after being planted, but also thirty to fifty years hence? The landscape gardener as we understand his work, must know not only what trees and shrubs are adapted to the varied locations in the garden he is creating but also which will do well in that particular latitude, and further he must know to what size and condition each individual specimen will develop when it has reached maturity. He must combine all these varied elements into first what will create a beautiful picture forty or fifty years hence, second (by filling in other details which are to be subsequently removed as the final effect grows) one for only twenty-five years hence, and still work no injury to the final master-piece. He must not only do this but he must provide details that will make successive pictures from the time of the first planting until the final result is attained. His material is of such a changing character that all the numerous variations of nature must be provided for; indeed we cannot conceive of any profession that calls for a wider knowledge than does this one.

DO YOU WANT detailed information about the organization and workings of the various national trade organizations? You will find what you want in our trade directory and reference book for 1894. Price $2.00.

DO YOU WANT a complete alphabetical list of carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

DO YOU WANT a copy of the rulings of the express companies about rates on shipments of plants and nursery stock? You will find full information in our trade directory and reference book for 1894. Price $2.00.

DO YOU WANT the census statistics regarding the florist, nursery and seed trades? You will find them in our trade directory and reference book for 1894. Price $2.00.

NOTHING SUCCEEDS LIKE SUCCESS 'TIS SAID.

Long's Florists' Photographs

have succeeded successfully. Reasons lie back of the case however. 1st. The time was ripe for their introduction. 2nd. Their general get-up commended them to every practical florist. 3rd. Their finished beauty and character tell a big story, attractive to those not already using them. See catalogue, furnished on application to

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

D. I. BUSHNELL, St. Louis, president; S. E. BRIGGS, Toronto, 1st vice-president; A. L. DON, 114 Chambers street, New York, secretary and treasurer.

HOWE, HAMILTON & GRANT, seedsmen of Minneapolis, burned out July 22.

Springfield, Mass.

The second annual exhibition of the Hampden Horticultural Society devoted to sweet peas was held on July 13 and 14. The display was very beautiful and embraced about every variety in cultivation, besides many which were now shown for the first time. Rev. W. T. Hutchins showed a collection of eighty varieties, and O. H. Dickinson, A. M. Spangler, L. D. Robinson, A. H. Hixon, B. L. Bragg Co., and others also staged large collections, in addition to which there were fine displays of roses, hollyhocks, dahlias, etc. from several exhibitors.

New Orleans.

The New Orleans Horticultural Society held the monthly meeting on the 19th at 10 Royal street. The following officers were elected for the ensuing year: M. Cook, president; J. H. Menard, vice-president; Paul Abele, secretary; J. Eblen, treasurer. After the election the members all adjourned to a restaurant where a very fine dinner was awaiting them.

C. C. ABEL & CO. - BOX 920, NEW YORK.

Worcester, Mass.

The weather still continues to be insufferably warm, with no rain to amount to anything, and vegetation is suffering very much in consequence. Carnations in the field that were planted before the fifteenth of June are holding their own fairly well, but anything planted much later is at a standstill, and unless we have an abundance of rain the last half of this month won't be big enough to house.

Considerable funeral work has helped us to dispose of some of the quantity of stuff going to waste, but outside of this and a little cut flower trade that is regular the year round there has been nothing.

Notwithstanding the excessively humid weather of July 19 there was a large attendance at the regular exhibition of the Horticultural Society, and a very good display of flowers. There were some good stands of '94 seedlings, made up of a great variety of splendid flowers; the displays made by F. A. Blake and H. A. Jones were especially noteworthy and secured first and second premiums respectively. Some good petunias were also shown by F. A. Blake, which were awarded a first, with Mrs. A. A. Hixon second. Considerable interest was centered on the display of baskets (no restrictions), which were divided into two classes, amateur and florist. In the amateur class F. A. Blake had the best made up basket, and H. A. Jones the second best; H. F. A. Lange carried away the honors in the florist class, and W. J. Wood secured second prize.

But the feature of the show was the display of sweet peas made by W. T. Hutchins of Indian Orchard, Mass., which was a revelation to many of us of the wonderful improvement the sweet pea has undergone. Mr. Hutchins exhibited some eighty varieties, shown in bunches of about fifty stems, filling over one hundred vases; among them were most of the Eckford novelties, which surpassed anything ever shown here for size, fragrance, substance and color. Among the varieties that showed the results of an especially careful treatment were the following:

Mrs Sankey, a large finely formed white.
Royal Robe, delicate pink, large and of good substance.
Mrs Eckford, splendid primrose yellow.
Countess of Radnor, a beautiful mauve.
Peach Blossom, salmon and white, beautifully shaded.
Dorothy Tennant, large, rosy mauve.
Stanley large, finely formed maroon.
Lady Penzance, beautiful combination of pink and rose.
Her Majesty, large rose pink.
Indigo King; the name is a description.
Mrs. Gladstone, silvery pink.
Princess of Wales, large mauve on white field.

SEEDLING.

THE AMERICAN FLORIST CO.'S
DIRECTORY
AND
REFERENCE BOOK
FOR 1894
CONTAINS THE FOLLOWING:
1. The names and addresses of the Florists, Nurserymen and Seedsmen of the United States and Canada, the exact branch of the business each is engaged in being indicated.
2. A separate list of firms that issue catalogues, the space devoted to each branch of the business in each catalogue being also given.
3. A list of the names and addresses of superintendents of leading parks in the U. S. and Canada.
4. A list of the principal cemeteries of America at which the arts of the landscape gardener and florist are used in beautifying the grounds.
5. A complete, alphabetically arranged list of Roses in commerce in America, with class, habit of growth, date of introduction, name of introducer, and brief, accurate descriptions of the flower of each. Synonyms are also plainly given.
6. A complete, alphabetically arranged list of Chrysanthemums in commerce in America, with class, and brief, accurate description of each. Synonyms are noted and varieties that are very popular with American growers are designated by a star, and this year's introductions by a dagger.
7. A complete, alphabetically arranged list of the Carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each.
8. Seasonable Hints for the year, arranged in weeks, written by Mr. William Scott, and covering every detail of a general florist business. This is decidedly the most valuable contribution to the literature of the trade ever published. It is written in a plain, practical way, by a man who knows what he is talking about.
9. A historical sketch of the Society of American Florists from its organization to date, including officers for each year and lists of essays read at each meeting, with other information of interest.
10. A similar historical sketch of the American Association of Nurserymen.
11. A similar historical sketch of the American Carnation Society.
12. A similar historical sketch of the American Seed Trade Association.
13. Similar historical sketches of the Florists' Hail Association of America; of the National Chrysanthemum Society of America; of the Florists' Telegraph Delivery Association.
14. A complete list of all National and Local Trade Organizations, with names and addresses of principal officers, time and place of meetings, etc.
15. Statistics of Commercial Floriculture in the U. S. from the last census.
16. Statistics of the Nursery Industry in the U. S. from the last census.
17. Statistics of Seed Growing in the U. S. from the last census.
18. A list of Leading Horticultural Societies, with name and address of the Secretary of each.
19. Full information about Express and Postage rates on plants, shrubs, trees, seeds and bulbs

No less than 270 pages of valuable reference matter in compact form, and all UP TO DATE.

PRICE $2.00 POSTPAID.

Three thousand, in 3½-inch pots; extra fine stock, at $10.00 per 100.

P. R. QUINLAN & CO.,
904 W. Genesee St., Syracuse, N. Y.

Cincinnati.

The 69th monthly meeting of the Cincinnati Florists' Society was held Saturday evening, July 14, with about 25 members present, President Critchell presiding.

The committee having in charge the decorating of Mrs. Holroyd's grave was discharged and tendered a vote of thanks for their services.

I do not know how it is in other cities where Florists' Clubs are organized, but with us it is very hard to get the boys to attend the monthly meeting. The only time we get a real good turnout is when there is something to *eat*; that seems to be a drawing card. We have a few members who are willing to read papers, but it is very discouraging to spend several hours preparing a paper and then have only a handful present to hear it read.

Mr. Wm. Murphy at this meeting finished the papers on his trip to the Golden Gate. While the papers were not confined strictly to floricultural topics, yet they gave interesting descriptions of sections of our country, including the great National Park with all its beauty and grandeur, its hot springs, the volcanic eruptions, and a great many other very interesting natural features. He described his fright at seeing a real wild black bear. Wm. said his heart almost jumped out of his mouth; all the bad deeds he had ever committed all passed through his mind in a few seconds, but thanks to a kitchen girl at the hotel and a little dog his life was spared. Ask him to tell you the sponge story!

Trade is of course in the same old way. Funeral work with some of the florists has been very good during the week. Mrs. Fairchild of Covington had quite a nice wedding decoration for the 19th consisting of sweet peas.

Geo. Meek of Covington, buried his mother last week.

Mr. Allick, Sec'y and Treas. of The Highland Floral Co., Dayton, O., was in the city Monday. The writer caught a glimpse of Walter Mott of Philadelphia as he was coming into the city Tuesday evening. Wm. Rendigs, assignee of Chas. J. Jones, Jr., sold at auction Monday, the 16th, all the greenhouses, sash, boiler, pipes, stock, in fact everything that was left of the plant. All told the sale amounted to a trifle over $400.

Otto H. Walke, the Vine street florist who has two penny in the slot machines was arrested for selling impure orange cider and fined $25 and costs. Otto should be more careful.

Our outing at Woodsdale will be a grand success, all arrangements are made and nearly all the florists are going. G.

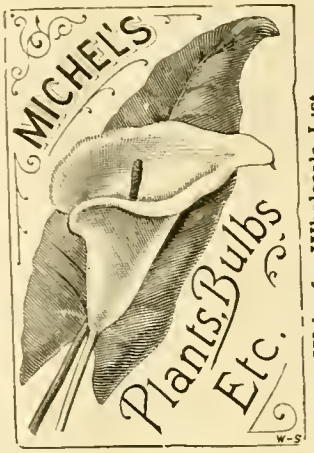
VIOLETS POT GROWN.

We have a fine stock of pot grown plants, from which experience teaches best results for quality and quantity of flowers can be had:

MARIE LOUISE, SWANLEY WHITE, CZAR AND SCHOENBRUN,

from 2 inch pots, $1.00 per 100; $20.00 per 1000.

Chrysanthemums, young, vigorous stock, just the thing for single stems, in 50 PRIZE WINNING SORTS, $1.00 per 100; $10.00 per 1000.



We still have a few thousand 2½-inch plants, strong, of WHITE LA FRANCE and AMERICAN PERFECTION, at $1.00 per 100; $10.00 per 1000.

Above are two ideal Roses, surpassing most varieties in loveliness of shading, and surpass all without exception for durability in a cut state.

ROSES in best commercial sorts, 2½-inch strong, our selection, $20.00 per 1000. An enormous stock in other departments.

EXTRA PANSY SEED.

MAMMOTH SUNBEAM STRAIN.

A grand collection of giant flowering varieties, very large, of perfect form, and choice colors; carefully selected; better seed plants this year than ever; receive very high praise from my customers; no finer strain offered anywhere; florists should sow of it.

Trade pkt., 500 seeds, 25c; 3 pkts. 60c; 6 pkts. $1.00. A pkt. of the new Monkey Face pansy with every $1 order.

JOHN F. RUPP, Shiremanstown, Pa.

PANSIES...

Every Grower Claims the Best.

I am willing to have mine tested alongside of any in the market. Over a thousand florists used them last season, were pleased with them and made money out of them.

Between Sept. 1st and Dec. 1st I will have a MILLION or more plants to sell. They can not be offered in competition with cheap grown seed, but quality considered, are remarkably cheap at the price.

By Mail or Express, prepaid, 75c. per 100; by Express at your expense, $5.00 per 1000. Liberal discount will be allowed on large orders.

An honest sample of the plants will be mailed you on receipt of ten cents, and terms are absolutely cash in advance.

ALBERT M. HERR, L. B. 496, Lancaster, Pa.

ZIRNGIEBEL GIANT PANSIES.

Owing to favorable weather, have been magnificent this season. Never before have we obtained such size and colors; and as usual, wherever exhibited, have eclipsed everything else, receiving also the most flattering testimonials from the leading florists and seedsmen all over the country.

New seed ready now of both the Giant Market and Giant Fancy in trade packets of 2,000 and 500 seeds respectively at one dollar each, with practical directions for growing pansies. Also plants for sale later on.

DENYS ZIRNGIEBEL,
. . . NEEDHAM, MASS.

Pansy ★ Seed.

The **JENNINGS STRAIN** of high grade Pansy Seed. New crop now ready. Saved with special care from only the very finest varieties and (warranted) first-class in every respect.

THE JENNINGS XX STRAIN.

The cream of Pansies. Grand colors mixed, pkt., 1500 seed, $1.00; 1 oz. $8.00.

The Jennings Strain, finest mixed, pkt. $1.00 about 2500 seed; 1 oz. $6.00; 3 ozs $15.00. No skim milk in this strain. (They are just as good as I can make 'em). To my old patrons I would say they are a big improvement over last season—more variety and finer colors. The best strain for florists either for winter bloom or spring sales; all large flowering.

Black Dr. Faust, finest.....pkt., 2500 seed, $1.00
Finest Yellow, black eye..... " " 1.00

Foreign Notes.

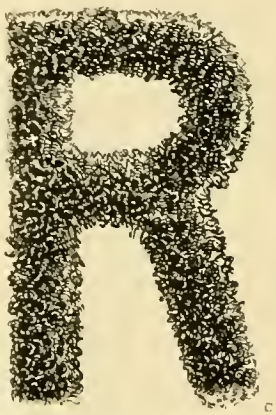
A new hybrid disa, raised by Jas. Veitch & Son, is D. Langleyensis. It is the result of a cross between D. tripetaloides and D. racemosa, both comparatively recent species. Flowers magenta pink, very freely produced. It is likely that more beautiful hybrids will result from the same cross.

A new variety of Lælia tenebrosa, which has received the varietal uame Pittiana, is described as being of very great beauty. Across the lower sepals the flowers have a breadth of 8 inches, and are very shapely. The sepals are lucent yellow green, tinged and veined with purple. The petals are the same color, tinged with purple on the lower side, with a band of greenisb yellow up the center. The lip is white, with lines of bright crimson; the base of the lip white. The plant is described as being fully as beautiful as the Walton Grange variety of tenebrosa, for which the owner recently refused an offer of 160 guineas ($800).

Sweet pea Emily Henderson was the recipient of a certificate from the Royal Horticultural Society in June last. A correspondent of the London *Journal of Horticulture* says be has four named varieties of white sweet peas, but none equals Emily Henderson.

It is said that the floral tributes at the funeral of President Carnot were the richest ever seen at any public funeral, and it is estimated that half a million dollars was expended on these flowers. Twelve two-borse cars were loaded with floral emblems. The tributes from the various crowned heads followed these cars, borne on the shoulders of firemen in uniform.

Lælio-Cattleya Canbamiana is another beautiful hybrid raised by Veitch & Son, a cross between Lælia purpurata and Cattleya Mossiæ. It is dwarf in habit; the sepals and petals are pure white, while the lip, which is large and frilled, is velvety crimson purple with a narrow white border. Lælio-Cattleya Arnoldiana is another beautitul thing raised by Sander, being the result of a cross between L. purpurata and one of the summer blooming cattleyas of the labiata section. The flower is very large, sepals and petals rosy purple; the lip intense magenta crimson, with a bronzy yellow throat.



Do you want Mr. Scott's seasonable hints for the year in book form, so that you can refer readily to his suggestions for any week in the year? You will find them in this form in our trade directory and reference book for 1894. Price $2.00.

"Danger in Flowers."

An article under the above head is making the round of the dailies, in which all sorts of terrible things are said to result from inhaling the perfume of flowers. An alleged scientist is said to be authority for the statement that operatic singers have completely lost their voices through their passion for certain flowers. The following extract from the article shows conclusively the absurdity of the whole thing:

To some persons the perfume of the violet is particularly injurious. Others should avoid the lilac, and others the gardenia. Personal susceptibility has much to do with the injurious effects that may result from smelling certain flowers, and M. Joal can not, therefore, say what particular flowers should be avoided by certain temperaments.

The writer cites a case of a young woman who used to invariably faint at the smell of orange blossoms. The curious conjunctiou of a susceptible young woman and a bridal wreath in this illustration might lead to the supposition that there is more in the case than M. Joal makes apparent. He tells of a soldier who lost consciousness under the effect of the odor from a peony, and alleges that persons have been known to suffer a violent attack of coryza from smelling roses. It is suggested that a great perceutage of the headaches, colds in the head, and the like, ailments from which people, especially women, suffer on the morning after attending a ball, dinner party, or other social function, is a direct result of the odors of the floral decorations.

Of course it would be unreasonable to attribute the colds to sitting in drafts with unprotected shoulders. And where do the men catch their colds and headaches? Of course the latter can not possibly come from overindulgence in liquid refreshments. It must be the smell of the flowers at a distance—or from around the corner.

Look Out for Him.

A party by the name of J. J. van Julay, claiming to be the owner and patentee of a wooden hose mender, managed to swindle several florists in Cleveland recently by clever misrepresentations. He is described as about 40 years old, 5 feet 5 inches tall, weight about 135 pounds, sandy complexion, a long sandy mustache, wears glasses, talks with a slight German accent, and claims to be a Bohemian count.

WHENEVER you want anything pertaining to the trade, and do not find it offered in our advertising columns, write to us and we will take pleasure in assisting you to find what you want.

TO TAKE PLACE OF WIND MILLS

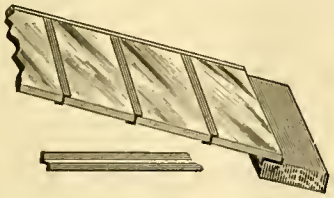
HOT AIR PUMPING ENGINES

A Windmill

Is unreliable because it depends upon the element for its power; hydraulic rams also depend upon favorable conditions and waste as much water as they secure. Steam pumps require skill and hand pumps demand labor and time. The

DE LAMATER-RIDER OR DE LAMATER-ERICSSON Hot-Air Pumping Engines

are especially designed for pumping water, and from shallow streams or any kind of well. They are simple, safe and reliable, require no steam and have no valves. They require very little heat to operate them, and can be arranged for any kind of fuel.



Send for illustrated catalogue to

THE DE LAMATER IRON WORKS

87 South Fifth Av.,

NEW YORK, N. Y.

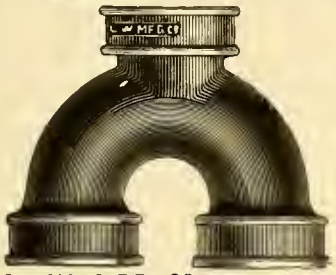
IMPROVED GLAZING.

GASSER'S PATENT ZINC JOINTS for butting glass makes greenhouses air and water tight; also prevents sliding and breakage from frost. Does not cost as much to bent a house glazed with the joints, thereby saving enough in fuel to more than pay the additional cost of glazing. The leading florists of the country are using them. Write for circulars with full particulars and price list.

J. M. GASSER, FLORIST,

Euclid Avenue, CLEVELAND, O.

THE CHAMPION Automatic Ventilator.



The cheapest, easiest to operate, and by far the best machine in the market. Don't buy a Ventilator until you have seen my illustrated descriptive circular, which will be sent you free, giving prices, etc. Also Champion Soil Pulverizer and Sifter.

Address, E. E. WOLF,

Box 114. SPRINGFIELD, O.

The Tenth Annual Meeting

OF THE

Society of American Florists

WILL BE HELD AT

ATLANTIC CITY, N. J.,

AUGUST 21, 22, 23 & 24, 1894.

Members may remit the annual dues ($3 00) to the secretary prior to the meeting, thus avoiding the crowd and relieving the officers on the opening day. Badge for 1894 will be sent by mail to those who remit in advance of the meeting.

Intending members can obtain any information wanted by addressing the secretary.

OFFICERS:

J. T. ANTHONY, Chicago, president; ROBERT KIFT, Philadelphia, vice-president; WM. J STEWART, 67 Bromfield St., Boston, Mass., secretary.

WHENEVER you want anything pertaining to the trade, and do not find it offered in our advertising columns, write to us and we will take pleasure in assisting you to find what you want.

DO YOU WANT detailed information about the organization and workings of the various national trade organizations? You will find what you want in our trade directory and reference book for 1894. Price $2.00.

Mme. Caroline Testout.

This most beautiful of pink roses has aroused a wide interest among both professional and amateur florists, and inquiries concerning its habit and cultivation have been numerous during the last few months. Many of them have been answered by letter, but to answer them all in this manner would require the patience of Job, as well as a stenographer and typewriter. Fortunately it is not necessary to answer personally all who would learn about the Testout when so good a medium as the AMERICAN FLORIST is available. Judging by the great popularity and beauty of this new rose, as well as from the very numerous inquiries to which I have referred, a short article concerning it would not be out of place.

The questions which have been addressed to me on the subject refer principally to the nature of the soil in which it is grown, treatment, whether Testouts will do well grown side by side or in the same house with other roses, and of course nearly all are particular to ascertain the temperature. In my experience this is the most profitable pink rose grown to date. But to be grown successfully its requirements must be thoroughly understood and met by the florist. If mistreated and carelessly handled experience proves it to be anything but profitable. Two years ago my bed of six hundred plants paid me at least double the money received from any other rose grown on my place.

There were two or three good reasons for the unusual profit afforded by them that year, which it is well to keep in mind: The first and most important, doubtless, was that the Testouts from my place were the only ones of note offered in the Chicago market. Again, it was a new rose, and a new shade, and producing many specimens as large as hybrids, the demand remained great throughout the entire winter. Still again, the soil in which they were grown was exactly suited to them. Added to this was the very important fact that they were not cut with long stems until well into the winter. A bed of the same size last season did not pay one half so well, for which there were also as good reasons. It was not quite so much of a novelty; there were more of the variety on the market; by a most unfortunate mistake the soil of the Testout bed was much too light, and unlike the previous year, they were cut entirely too heavily during the months of October and November, leaving the plants in poor shape for the drain of the winter. Notwithstanding these apparent drawbacks it proved to be the third best paying rose on my place, Victorias taking the first and Meteors the second place.

In my experiments in growing Mme. Testout I have found that it is entirely possible to grow it successfully in the same house with such varieties as Perle, La France, American Beauty, Mme. Watteville and Mme. Hoste. That is to say, practically, that it will do well in a night temperature of 60°. I have found that better Brides, Mermets, Gontiers and Christine de Noue can be grown in a temperature five degrees lower.

Soil best suited to Testouts is rich, yellow loam, with the usual amount of manure. Apropos of manuring, let me say here that it is impossible to give minute directions as to the amount or kind to be used because of the great difference in soils. Some soils need more, others less—some require one third, others not more than one eighth. One must use his own judgment; if he has none the sooner the better he abandons the florists' profession. He need not be an expert chemist, but all the requirement would be to use the small modicum of common sense he has. I remember once visiting a friend who is a noted rose grower, and commenting on the great growth of wood and admirable bloom he was having, when I enquired as to his method of manuring. He informed me that he had used no manure whatever. This was so much of a surprise to me that I took pains to ascertain the kind of soil he used. It seems that about eighteen months before my visit to his place he had heavily manured a piece of land and planted potatoes on it. After the potatoes were harvested he seeded it down to timothy. When the timothy was well grown the following May he plowed it under, and after it was well rotted, from that ground he took the soil for his rose bed which had so pleased his visitor. He was right and yet wrong. He had not manured the bed, but the field was composed of most heavily manured soil.

Plants grafted on the Manetti I have found to produce the best results during the fall and winter months, but very little difference was apparent between the grafted and the rooted plants after the first of April. The grower, to be successful with Mme. Testout, must exercise the greatest of care never to allow the temperature to fall below 60°, especially if the foliage is wet, or blackspot will surely result.

It is a very common error to suppose this rose to be worthless as a summer rose because its flower is not very double. On the contrary, if they are cut close, I

have found it to be the very best pink rose I have, or indeed, that I know of. I have been shipping them constantly all summer to St. Louis, their excellent quality securing for them a good demand.

W. W. COLES.

Among Chicago Growers.

Several months ago we published some notes in which reference was made to the successful way in which Mr. Bauske, of Bowmanville, was handling two year old roses on benches. We paid a visit to this establishment the other day. In conversation Mr. Bauske stated that he had received numerous letters of inquiry from growers at different points regarding his modus operandi.

"Now," says Mr. B., "I am an extremely busy man; besides I find the pruning knife a handier tool to ply than the pen, for which reason I have not replied as fully to these communications as their authors would probably wish. If my experience in this line, however, should be of interest or possible value to the readers of your journal I shall be pleased to give it. I can claim nothing new though in the way I handle my roses, neither do I claim it to be the only successful way of growing them, as others doubtless have produced as good results under different modes of treatment. As is well known climatic and soil conditions vary greatly in different localities, hence the difficulty in formulating a rule to hold good in all cases.

"Now, as regards my stock of last season, which consisted almost entirely of two year old plants, I can state that the result, both as regards quality of bloom and number of same, was entirely to my satisfaction. I kept an account of roses cut daily, and find by comparison with the year ending July 1, '93, which was the result obtained from a majority of young stock, that the average cut for the entire year is considerably in favor of last season. On the other hand, if we simply compare the corresponding winter months I find little if any difference in the cut for the two seasons."

"Do you have equal success with all varieties?"

"No, I can't say that I do. Perle, for instance, doesn't do nearly as well with me the second year as the first. Mermets, Brides and Meteors do well. The house of Gontiers last year paid well, and so did the Beauties, which latter were probably as good as I ever grew. For some reason I can do nothing with La France, so I don't grow it at all any more.

"As regards treatment during the summer months, I vary hardly any from that given to young stock; that is of such varieties as Mermets, Brides, Meteors, Perles, etc. I keep the stock growing right along. The benches being filled with roots the plants require more water than young stock, and this fact should not be overlooked. To keep the tables from drying out too quickly I apply a good mulching of coarse manure. Liquid fertilizers during the hot summer months I regard as rather dangerous, and for that reason I prefer a top dressing, which besides giving nourishment to the roots shades the ground and keeps it loose at the same time. I syringe thoroughly twice a day in warm weather.

"I don't like to let the wood grow at will, and then be obliged to trim severely in fall; for that reason I commence trimming out in spring and early summer a little at a time, as I go over the beds cutting the bloom. Some varieties, however, Gontier more particularly, will need a more severe cutting back in fall. Previous to this operation I water but sparingly for a few weeks, but never allow the benches to become entirely dry. Immediately after pruning copious watering is resumed according to the weather."

"How do you treat Beauties, Mr. B?"

"Old stock of Beauties can not always be depended on, but if successfully grown will in my opinion pay better than young stock. I had a couple of benches of these last year, and the same number of young plants. The net results are largely in favor of the old stock. The cut from the latter was about double that of the young plants. The first cut in fall from these old plants was remarkably fine, both as regards size and form of flower as well as stem and foliage. The succeeding crops, however, were but medium, both in length of stem and size of flower, though of good form. Now, as compared in money value these flowers would sell for somewhat less than A1 long stemmed stock. For instance, when the latter would bring $3 per dozen these would sell for $2, but as I cut fully twice the number on the average the plant paid the best.

"This year I replanted last season's young stock in fresh soil, as the Beauty will do nothing the second year if left in the old soil. An equal number of young plants are benched at the same time, to keep up a rotation the following season. I never allow the plants to suffer for want of water before replanting, although it is probably best to withhold the water to the extent of stopping the most succulent growth. As soon as the new benches are prepared with suitable fresh soil the plants are taken up carefully, the old soil is shaken off, care being taken to disturb the fibrous roots as little as possible, and then immediately planted in their new quarters. In this way the plants, if the weather is not too hot, suffer but little, and the roots will take hold in the new soil at once. I should have stated that before taking the plants up they are cut back sharply, but in such a way as not to denude them entirely of foliage."

"I see, Mr. Bauske, you are just starting in to take up this bench of Brides, which appear in vigorous growth?"

"Yes, this bench and one other of Mermets were the only young stock I planted last season. Well, you see the balance of the house is planted in Meteor, and as this rose requires a higher temperature than Bride I concluded it was best to move the plants into another house. It is not the first time I have taken up such stock in full growth, and replanted with satisfactory results. You see the plants are not cut back very hard; I prefer to cut a little more if necessary after the plants commence to grow again.

"Soil? Well, mine is the regulation rose mixture of sod, clay loam and manure. I don't use my sod quite as green as some growers do, besides I like to have it chopped up well, not too fine of course, but small enough to mix thoroughly with the manure, which latter I prefer not too much spent."

"But now to sum up, what in your opinion are the salient points to consider in carrying over your stock for the second year?"

"Well, if we take for granted that such stock does as well in winter as that of young plants, we might consider first the saving in expense of growing one half the quantity of young stuff, figuring that you keep up a rotation of an equal part of one and two year old stock. Last season here in Chicago was an exceptional one, as on account of the prospect for a steady demand at good prices for the entire summer months, in view of the exposition, I was induced to carry over nearly my entire stock, which necessitates the planting of a nearly entire young stock this year. Of course the success depends to a large extent upon the condition of the stock you wish to carry over; if the stuff is doing but indifferently in the spring it is best to throw it out and plant fresh. But to resume, in addition to the saving in stock you may add the cost of taking up and benching the young stuff. The next point gained is the result from three or four months cut of bloom for the summer months. The stock at this season of year brings but a small price, and some weeks may go to waste entirely, still what little is realized is a net gain. If you plant new every year in order to get your plants of a size to insure good results for the winter you are obliged to commence tearing up and replanting quite early, not later than the last of May or early June; in that way you lose the sales at Decoration Day and the whole month of June, which ordinarily pays as well as any month in the year, with the exception of perhaps the Christmas holidays. Talking about Decoration Day, I cut and sent into the market this year about 9,000 roses of fairly good quality, which netted me more money per 1000 than the stock cut at Christmas. We will admit that this was an exceptional year as regards prices at Decoration Day, but it goes to show the advantage of being able to cut a generous amount of stock at such a time. Besides this there is one other advantage, and that is your ability to be a constant shipper to the market. Your commission house, what is of greater importance, even if you supply the retail dealer direct, will serve your interests better if you can offer a steady supply without a break. These briefly are some of the salient points on this question."

"We notice, Mr. B., that you do not shade your houses in summer; what is your view on this subject?"

"Well, I am not entirely satisfied on this question in my own mind; I don't like shading, as it induces a soft growth of wood, which I like to avoid, yet take this summer with clear skies and extreme and at the same time dry heat a light shading would probably have been an advantage, though apparently the stock has not suffered. Last season I didn't shade at all, and the stock came through the summer in fine shape."

Reinberg Bros. have made extensive improvements this year. In the first place several ranges of their establishment underwent a thorough overhauling, both as regards the houses and also the heating apparatus. We are in the habit of speaking of the two Reinberg Bros. collectively as a firm, although, as a matter of fact, the growing establishments are managed separately. But as both places adjoin and there is little difference in either size or other condition between the two, we shall continue to treat it as a firm.

Besides the improvements above mentioned a number of new houses have been added; five saddle roof houses 12x100, running north and south, were completed this spring and are intended for growing violets, but at present are planted to Beauties for summer cutting. One other new house 24x150 in addition to the rose ranges, is already planted, and three more 24x150 houses are under construction for the purpose of growing carnations. This would give a total glass area of about 240,000 square feet. With the exception of the five houses 12x100 above men-

PERISTYLE OF PANTHEON.

DECORATIONS AT THE FUNERAL OF THE LATE PRESIDENT OF FRANCE.

tioned for violets and the three houses 24x150, and another five 12x100 for carnations, which latter are at present filled with summer roses, the whole remaining area is devoted to rose growing. There are twenty houses of Beauties, containing 24,000 plants, all in fine condition; these were planted at different times, so as to ensure a steady supply. A number of the houses first planted are showing good bloom and it is expected there will be no break of a continuous crop from now on. With the exception of two or three beds in solid ground every plant is grown on benches. Both members of the firm are agreed that so far as their observation goes there is not the slightest difference in the result obtained between benches and solid borders, the bench system being preferred for the reason that in their estimation it is easier to work. What is said about Beauties applies to the other stock as well; we find benches in every house, and considering the extreme hot spell through which the stock has passed, every house is looking well. The Reinbergs are thorough believers in early planting, commencing in May; the last house was planted previous to the first of July.

The short-span-to-the-south plan has by this time had a thorough trial, and proved completely satisfactory in every respect. In view of this fact a number of houses in the older ranges have been rebuilt on this plan, and others will probably be remodeled in the near future. As all the houses, the older ranges as well as the new, are built connecting in solid blocks, the well known fact that houses built on this plan shade the adjoining structures less than the other system appears to be the most valuable point in their favor.

Besides Beauties above mentioned Meteor comes next in importance; the number of these benched for winter blooming is about 9,000; Testout 6500, Perles 5,500, La France 6,000, Albany 1,500, Bridesmaid 3,600, Kaiserin 1,700, Brides 4,000, Mermets 1,500 and Wootton 1,500.

About 500 Mme. Pierre Guillot are grown for summer roses, the same number of Meteor, and 1,000 Beauties. The two new varieties, Testout and Kaiserin, are regarded highly by this house, as is indicated by the space devoted to them. The latter, Kaiserin, would have been grown still more heavily this season if it hadn't been for the scarcity of stock; as is being demonstrated at this place, for a first-class summer rose in particular this variety has certainly no superior.

Decorations at the Funeral of the Late President Carnot.

It is asserted that on no previous occasion has the display of floral emblems equaled those at the obsequies of President Carnot. It is estimated that their value reached half a million dollars, and, considered as a floral display, it was without doubt the most remarkable of recent years.

In the great courtyard of the Elysee, where the remains were lying in state, the walls were hidden by black draperies, edged with a deep border of floral wreaths. The imposing catafalque, presented in one of our illustrations, was hung with black and silver: at the foot of the bier were cushions bearing the ribbons and crosses of the various orders to which the President had belonged, while over all was the tricolor of France.

At the Pantheon, of which we present two illustrations, the steps were hidden by hundreds of wreaths, which it had been impossible to carry in the procession. The interior was simply draped in black; some floral pieces were arranged about the catafalque, which stood beneath an immense canopy.

In the procession, of which we also present a view, an immense quantity of floral pieces was carried on twelve two-horse cars, while the tributes from the various royalties were borne on the shoulders of firemen in uniform. Almost every one in the procession carried flowers in some form, and it is noticeable that the majority of the designs were wreaths.

The first place in the procession was given to the wreath sent by the new president, M. Casimir-Perier; it was seven feet in diameter, made of palm leaves and red roses. Queen Victoria sent a wreath of violets, the Prince and Princess of Wales one of roses and violets, and the Queen of Spain a very gorgeous affair of red and yellow. The American colony in Paris sent one of the most beautiful wreaths noted; it was composed of orchids and Easter lilies, mingled with maidenhair fern and scarlet flamingo flowers. The English colony sent a large wreath of marguerites, cornflowers and red carnations wound so as to form the tricolor, and across the center a Union Jack wound

sailor fashion. The students of France sent a wreath 12 feet across, borne on a huge car. The Greeks sent a wreath of orchids, which cost 2,000 francs ($400), and a shield of forget-me-nots having a white cross in the center (the Greek colors). Perhaps the only thoroughly tasteless emblem described was an oval of orchids, having above it what the bearer described as an "apotheosis of M. Carnot"—a large photograph of the late President, surrounded with red, white and blue ostrich feathers; still above that gilt palm leaves and a tuft of ostrich feathers, red, white and blue. The newspaper correspondents mercifully described it as "striking."

It may be noted further that orchids figured very largely in the funeral wreaths. That sent by the King of Belgium was composed of odontoglossums and cattleyas, while another, made of cattleyas only, contained 500 flowers. The wreath sent by the Emperor of Germany was 6½ feet across; it was composed of orchids, Gloire de Dijon roses and cycas leaves. We might continue these descriptions indefinitely; one deduction to be drawn from it is that in Europe at least no other floral emblem approaches the wreath in popularity, while for costly and beautiful work orchids lead all other flowers.

Chrysanthemum Notes.

Many of the readers of the articles that have appeared in the previous issues of the FLORIST have made, we are glad to understand, resolutions to keep notes on the growth of their plants, for we have received a number of inquiries by mail how to line out their books and what headings to use, which we have been very glad to answer to the best of our ability, and there is no doubt if we can get those growers together and express their minds at the meeting of the society we shall be able to arrange a book that will exactly meet the requirements of the growers of the Queen of Autumn in America. Up to the present time there have been probably very few notes made, but when the buds begin to set and are taken there will be plenty to jot down, and after the chrysanthemum season has closed some very valuable information may be gathered from these growers if they see fit to let the fraternity share in the practical knowledge they have gained.

There is but little to do with the plants after they have been tied up until the middle of August, except to keep a careful lookout for their welfare, and keep them on the straight road to success, so let us look forward and see what we can do later in the season to increase the popularity of this grand flower. The shows that are annually held all over the country have been a great factor in doing this, and a great deal depends upon the manner in which the magnificent blooms are presented to the public. We have received the schedules of prizes of the different societies, thanks to the secretaries, and with a few exceptions we note that the prizes for individual cut blooms are qualified with this restriction, "to be exhibited on stems not less than twelve inches in length and without additional support." Let us look at this a moment and ask the reason why. We fail to find any real good one. Why should not an exhibitor be allowed to show his bloom in any manner he wants to, or that he thinks will bring out the best points of his flowers? If he likes the manner in vogue in England, that is, on boards, let him show them that way, or let him exhibit them in bottles with any length of stem he may desire. Who is there, that ever attended any of the large shows, but that has many a time looked at a fine collection of blooms and said to himself that the exhibitor might have improved the looks 100 per cent if he had spent a little more time in arrangement? Mind you, we do not like or advocate the use of boards, and you will see later on that there are many in England of the same opinion, but we do not believe that making the exhibitor show his blooms on twelve inches of stem, often without a leaf, and the blooms nodding this way and that, any improvement, and artistically worse than the board system.

In a paper read before the National Chrysanthemum Society of England by Mr. C. E. Pearson, on "How to improve our chrysanthemum shows," the essayist speaks of the board system thus: "Now, no one disputes that our present system is the most convenient for comparing the merits of individual blooms, and for facilitating the labors of the judges; but then, are the judges the only people to be considered? And can a method be looked upon as perfect which not only stages flowers in stiff formal lines, which are not allowed to deviate a hair's breadth from the proverbial limit any more than if they were soldiers on parade or bricks in a wall, but also removes nearly all the stem, thus destroying the grace and elegance which nature gives even to the largest and heaviest bloom when properly displayed. To place a grand lot of flowers on an ugly green board (after strangling them with a tin collar) fixing them in straight lines in mathematical precision, may give full opportunities for studying the individual bloom, but the general effect, especially in a large building, of dabs of color in long lines is most repulsive to any one with the least artistic sense, and now that the size of the Japanese has increased until they crowd one another, and even overlap, the evil is possibly accentuated." Later on in the paper in speaking of making any change from the board system, which he remarks has often been advocated, and as often promptly objected to, he says: "It would, therefore, be almost presumptuous on my part to advise a radical alteration were it not that this so-called impossibility has already been shown to be perfectly feasible on the other side of the water, where our American friends now allude with contempt to the barbarous practice—now happily a thing of the past with them—of exhibiting chrysanthemums on boards."

In the discussion that followed Mr. B. Wynne remarked as follows: "With reference to what Mr. Pearson has said respecting the practice of showing blooms on long stems as in America I may say that I have two young gardening friends in the States who are familiar with all that pertains to the leading chrysanthemum shows in England. Last year after the Madison Square show at New York, which they visited, I had accounts from both with regard to that exhibition, and they particularly pointed out two things. The second point they impressed upon me was that the plan of showing blooms cut with long stalks in glasses was not a success. The blooms were too heavy to stand up without supports, and after the first hour or two was not much of an attraction. I subsequently saw illustrations of the Madison Square show and anything less pleasing I can hardly imagine."

A great deal that is written in the journals and reports on the other side of what we are doing is very unjust, and sometimes entirely uncalled for, but in this case I think that we can do something to make our exhibitions more attractive and greatly improve the general effect. ELIJAH A. WOOD.

West Newton, Mass.

TO PREVENT RUST.—Dissolve one pound of sulphate of copper in two quarts of ammonia in a 2-gallon jar. When dissolved add another quart of ammonia and stir well. [The liquid can be kept in this form for some time and used as needed.] Add a pint of this solution to a barrel of water and syringe the plants with a force-pump every two weeks. And don't let the time for spraying pass without attending to the operation.

Carnations.

While the plants are making themselves in the field it might be well for us to look ahead and make our plans for the following season. One of the first things to think of is the fact that we are likely to have a lot of new seedlings put on the market again. Looking at this from a buyer's point of view one can not help but wish there were fewer of them, for to try them all is quite an item of expense and not to try them all is possibly to miss the very ones that would suit you the best.

This seedling business is getting like everything else in which there has been a little money, very badly overdone. Not that we can get too many really good carnations, but the trouble is that every one who has a seedling that is fairly good puts it on the market, and the buyers expecting considerable more from it than it is able to fulfil get disgusted, and the next season are likely to buy few or none of the novelties offered. This feeling seems to be getting almost universal, judging from the conversation one hears among carnation growers. It remains with the introducers of new carnations to counteract this feeling by being very careful what they put out. This policy has been followed by a few, and one feels pretty safe in investing some money in their stock. Outside of a very few I do not think the seedling business last season paid much better than to have taken up the same room with a good standard variety. To make a seedling a go now it should in the first place be a decided advance over sorts we now have, and the higher this advance is placed the better. Then it should be held until there is a good stock of it, so that blooms can be sent to all the flower shows within reach, and a few good stores supplied with it, and there should be enough plants to supply a good demand for rooted cuttings without cutting the plants all to pieces and weakening the stock. Neglect of this latter precaution I think is often where a new sort gets its death warrant the first year it is put

THE SARCOPHAGUS IN THE PANTHEON.

DECORATIONS AT THE FUNERAL OF THE LATE PRESIDENT OF FRANCE.

on the market. These novelties are generally put on the market at a pretty high figure for rooted cuttings, and it is but just to the buyer that the plants are carefully grown to produce good healthy stock.

Some growers get fancy ideas about the value of a seedling, and think that the men who introduce it are making an independent fortune. I know of one case the past season where one plant of a new white was offered to several growers for $500. It would take a mighty good variety to be worth such a figure as that. Some growers evidently think there is an awful lot of money in a seedling or two.

It is interesting to grow a few seedlings every season, or if you can afford it a house of them, but we should all be very careful about putting them on the market until they have proved themselves of real worth to the average cut flower grower.

ALBERT M. HERR.

Miscellaneous Seasonable Hints.

Those who grow quantities of Lilium lancifolium, and I cannot see how a retailer can get along without them, will cut more than he sells of the pots, and remember the bulbs are perfectly good and profitable for another year; you have not forced them as you do Harrisii at Easter time. Don't throw them under a bench after the stem is cut; place them out of doors, and if the weather is very dry water two or three times a week till stems are ripe. They can then be stored away in any cool place, but keep them in the soil till you are ready to start growing again in January or February.

Gloxinia bulbs can now be bought so cheaply that it hardly pays to keep over the plants that are unsold, yet if you desire a few extra large plants and early ones for next year save those that you don't sell. The same rule applies to these as to lilies, and for that matter all deciduous bulbs. It is murder to suddenly stop all growth and then expect the bulb or roots to have laid up a store of latent vigor for next season. Withhold water gradually and you will be coming near what the plant was accustomed to in its native habitat.

It will soon be time (middle of August I think about right) to sow mignonette. Some advocate solid benches or a very deep bench. If you don't have that 5 inches of soil on a raised bench is good enough. The most important thing about its cultivation is a light house. If shady it will grow spindling and weak and useless. A temperature of 40° at night will suit it finely, with a rise of 10° to 15° in day time. Don't fall into the mistake that many do in growing it thick; 15 inches between the rows and one foot between the plants is amply thick enough. Sow a few seeds at every foot and thin out, leaving only the strongest plant. You may not have a call for mignonette spikes at $1.50 per dozen, but you cannot be without it in your retail trade, for of all "greens" in use in winter time it is the most acceptable, with a few flowers.

Cytisus racemosus, either large or small plants, is now growing very freely. Don't neglect the shears; you can now trim them into compact little heads, and they will stand any amount of shearing.

Adiantum cuneatum, the ever popular maidenhair fern, is always in demand. It is a common thing to see fine specimens here and there that have never been picked at, but seldom do you see good benches of it for commercial use. The demand for it in our trade is continuous every day in the year. The most profitable way to grow it is to plant it out in 5 or 6 inches of soil on a well drained bench. The soil should be one-half light loam, one-fourth thoroughly rotten cow manure and one-fourth well decomposed refuse hops. Some broken up charcoal mixed through the lot will also help. I would call the bench well drained if it had one inch of broken crocks and over them a very thin sod or a thin layer of the spent hops. There are many localities where the refuse hops cannot be procured. Then leaf mould—not muck from the swamp—will do as well. While growing a temperature of 60° at night in winter time should be the lowest. Undoubtedly a moist temperature is what they delight in, without being syringed. It is not half as easy to grow them here as it is in Great Britain on account of our much drier climate. The greatest enemy that A. cuneatum has is the slug. A small lot of these can be mastered by overlooking them and traps set in the way of cabbage leaves and sliced turnips, but a big lot must be treated to air-slacked lime dusted over and into the crowns of the plants. A bench of adiantum well grown will pay about as well as any crop that can be handled.

If you are short of any of the flowering begonias, such as incarnata and others they will now root readily, and make good useful plants by Christmas next.

The great trouble with a propagating house, or rather the sand, is the prevalence of anthracnose. This is an enemy to fight at all times, but particularly in hot weather. The ammoniacal mixture has been told about before, but I will just repeat that I have found the following formula answer finely, and keep the sand absolutely clear of this destructive little plant. It is 2 quarts of common liquid ammonia, at what is known as a strength of 24, in which dissolve 1 pound of sulphate of copper. Pour the whole lot into a barrel of water, say 35 to 40 gallons; I water the sand just before putting in the cuttings and if the fungus should make its appearance before the cuttings are ready to take out give the bench another sprinkling. Thousands of cuttings could be saved if this were followed out with every fresh batch of cuttings.

WM. SCOTT.

Cattleya Hybrids.

Lælio-Cattleya Amesiana. This handsome hybrid was raised by Messrs. Veitch about ten years ago and named in honor of the late Mr. Ames. It is the result of a cross between Lælia crispa and Cattleya maxima. It was pronounced at that time one of the finest of the Veitchian hybrids. It is intermediate in habit, dwarfer than crispa, still stately in appearance, resembling the grand exoniensis. The petals are of better form than the latter, white slightly suffused with pink, and beautifully undulated; the sepals narrower, of the same color; lip broad, expanding, beautifully frilled, margined with purple; front portion of lip rich amethyst purple two inches deep, bordered with a zone of white; the throat a rich yellow. This hybrid is a charming companion for exoniensis, flowering in late summer. We grow them in baskets suspended near the glass, and give the same treatment as cattleyas.

Cattleya minucia. This hybrid is another of the Veitchian gems, the result of crossing Cattleya Harrisoniæ with Cattleya maxima. The result is a plant of stronger constitution than either of its parents, and an ornamental plant; it makes sturdy growth, with two glaucous green leaves at the summit of the bulb. We have six large flowers standing fully expanded, each five inches across, the sepals and petals of a uniform pinkish lilac, veined; the lip broad, three inches long, slightly recurved, the front part of lip netted and colored as in maxima about one inch; the disc broad yellow extending into throat, interior throat turgid pink, side lobes bright lilac. This is indeed a charming hybrid and a grand companion for that other beauty, cucoglossa, which is another hybrid having Harrisoniæ for a parent, but flowering in the autumn.

Lælio-Cattleya Ingrami. This beautiful hybrid was raised by Mr. Ingram, an ardent amateur, after whom it is named. It is the result of crossing Cattleya Dowiana with Lælia Dayana. It is intermediate in habit, partaking of the character of both parents. In the flower the influence of Dayana is strongly pronounced, the petals being about two inches in length by one and a half in breadth, rosy purple; sepals of the same length but narrower and light purple; the lip broad, expanding, of rich velvety maroon, extending and suffusing the whole column. A few gold pencillings are noticeable through the front part of labellum. The rich coloring is here unsurpassed by any other orchid.

We grow this plant in a basket suspended in the cattleya house and use the same material which is used for other cattleyas, viz., good fibrous fern root. Immaterial the variety, whether osmunda, athyrium or polypodium, or a good live sphagnum of any variety and a little charcoal, a sprinkling of dry cow manure. Mix the whole together and you have good cattleya compost.

WM. ROBINSON.

Convention Notes.

TRANSPORTATION.

The committee on transportation say they have had several inquiries about special rates. They say that the special excursion rates to Atlantic City made by almost all railroads are cheaper than the regular convention rate of one fare going and one-third returning. They advise all the delegates to ask their agents for the *special excursion rate through to Atlantic City*. The low rates offered are made to induce travel to the shore, and we think are about half the regular fare.

The Philadelphia club will go by a special train leaving on Monday afternoon. This train will be in charge of the transportation committee. It is to be decorated both inside and out and we are assured that no one will be allowed to suffer from thirst or hunger en route.

HOTELS.

The hotel committee has prepared a list of all the prominent hotels and large cottages in Atlantic City and have made arrangements by which they are to have an up to date account of their accommodations on Monday, the 20th of August. This will be presented to delegates on trains between Phila. and Atlantic City, and copies can also be obtained from the committee at the convention hall. The committee have been assured that there will be no difficulty whatever in finding accommodations for all the members and their friends.

For those who desire strictly first-class accommodations the following hotels are recommended: The Dennis (no buffet), $3.50 per day; the Shelburne (no buffet), $3.50; the Brighton, $3.50; the Windsor, $3.50; Haddon Hall (no buffet), $3.50; the Seaside (no buffet), $3.00. The name of hotel and Atlantic City is all the address required. All the above named houses are situated as near to the beach as possible; they are all number one in every respect. The prices quoted are regular rates; for extra accommodations, special rooms, etc., an additional charge is made.

The large cottages, accommodating from 50 to 150 people and whose rates range from $1.50 to $2.50 per day, accommodate the great bulk of summer visitors, and it is safe to say that a man can suit his purse and tastes in hotel accommodations better in Atlantic City than anywhere else in this country.

THE BOWLING MATCH.

It has been settled that the bowling match is to take place on the Brunswick alleys, corner of Indiana and Atlantic avenues. There are five alleys in this establishment side by side. They are in good shape, plenty of room to run and nothing to interfere with a bowler delivering a ball from either side of alley. The only drawback is that they are not regulation, being but 36 inches wide and the pins only 10 inches apart. They are, however, regulation length, 60 feet from head pin to toe line. There is in addition plenty of room for spectators. The committee have exclusive use of the room which contains the alleys for the two evenings on which the tournament will take place, Wednesday and Thursday, August 22 and 23. As the alleys are public there is nothing to hinder anyone from getting them down fine, and we imagine there will be some tired boys about this establishment before the contest is over.

There will be three team prizes: First, a large silver vase especially made for the occasion; 2d, a handsome ice pitcher and tray that will be an ornament in any florists' club room; 3d, a satin surfaced silver vase and tray. There will be three individual prizes for the best average scores made: First, a sterling silver cup appropriately engraved; 2d, a gold scarf pin in the form of a thistle with a small diamond dew drop; 3d, a pair of gold link sleeve buttons.

There is also to be an individual match for those who are not taking part in the tournament. Everyone who desires will have a chance to roll one game, those making the three highest scores receiving handsome prizes.

The Spaulding cup, now in possession of the New York club, having been won by them from the Phila. club at St. Louis, will of course be the prize of the meeting. The conditions regulating this cup are that it is to become the property of the club winning it the second time. As both New York and Phila. have won it once this contest has a special significance for them. In addition to these prizes the *Florists' Exchange* offers a handsome silk banner, to be given to the club making the highest score in the *first* game. This prize has, like the Spaulding cup, to be won twice to become the sole property of the winner.

The teams are to consist of six men each, as before. Each team will roll two games, the total number of pins in both games deciding the victors. It is proposed to start all the teams on number one alley, then to No. 2, 3 and 4 and back again to No. 1, and so on until the ten frames are completed. In this way all the teams will roll on the same alleys and there will be no choice of positions. Four teams can roll at once. The No. 5 alley will be reserved for the individual match, which can be going on at the same time. Those desiring to enter the contest (and the committee hope that every florists' club will be represented) should address at once John Westcott, Ridge and Lehigh avenues, Phila., chairman of bowling committee.

BOWLING RULES WHICH WILL GOVERN THE TOURNAMENT AT ATLANTIC CITY.

1—The game adopted to be played by clubs in this tournament shall be what is known as the American Ten Frame Game.

2—There shall be a line drawn across the alleys sixty feet from the head or front pin.

3—Any wooden ball may be used that does not exceed twenty-seven inches in circumference.

4—The game shall consist of ten frames when, should the number of points be equal, the play shall be continued until a majority of points upon an equal number of frames shall be attained, which shall conclude the game. All strikes and spares made in the tenth frame shall be completed before leaving the alley and on same alley as made.

5—Players must play in regular rotation, and after the first inning no changes can be made, except with the consent of the Captains.

6—Players are to roll but a frame at a time, and to change alleys every frame.

7—The Umpires shall take great care that the regulations respecting the balls, alleys and all rules of the game are strictly observed. They will

THE FUNERAL CAR.

DECORATIONS AT THE FUNERAL OF THE LATE PRESIDENT OF FRANCE.

be the judges of fair and unfair play, and shall determine all disputes and differences which may occur during the game. They shall take special care to declare all foul balls immediately upon their occurrence, unasked, in a distinct and audible voice.

8—Umpires shall be selected by the Captains of the respective clubs, and they shall perform all the duties in Rule 7, except recording the games, which shall be done by scorers, one of whom shall be appointed by each of the contending clubs.

9—No persons except the Captains shall be permitted to approach or speak with the Umpires, Scorers or players during the progress of the game, unless by special request of the Umpires.

10—A player must not step on or over the line in delivering the ball, nor after it has been delivered, until it leaves the alley. Any ball so delivered shall be deemed "foul," and the pins (if any made on such ball) shall be placed in the same positions as they were before the ball was rolled. It is also considered a foul ball if any part of the person should touch any part of the alley beyond the line before the ball leaves the alley. All foul balls shall count as balls rolled.

11—Should any ball delivered leave the alley before reaching the pins, or any ball rebound from the back cushion, the pins, if any, made on such balls shall not count, but must be placed in same position as they were before the ball was rolled. All such balls to count as balls rolled.

12—Persons to act as Judges shall be chosen, one by each Captain, who shall take their positions at the head of the alleys and see that the pins are properly set up, and that no one interferes with them in any way until the player is through rolling. They will immediately report to the Captains any irregularities that they may notice during the progress of the game.

13—The dead wood must be removed from the alley after each ball. Should a pin be displaced from the perpendicular and in such position that it falls on the removal of the dead wood it is to be counted as down.

14—Sufficient space shall be allotted to the participants in the game, to which none but members of the teams shall be admitted.

A SHOOTING MATCH.

Friday, the 24th, is to be a day of sport, and while we are not authorized to say very much about the arrangements for this day, we feel that it will be best to let the boys know that the committee have arranged to have a shooting match at Blue Rocks by teams of six men each, representing the various florists' clubs.

This match is to come off at the ocean end of the large pier and will no doubt be a very interesting affair.

There is to be a handsome silver vase for the first team prize and valuable souvenirs for the three individuals making the best scores.

The committee will furnish guns and ammunition, but if anyone has a pet shooting iron he is at liberty to bring it along. K.

The Outlook for the Retail Florist.

In the present hard times the outlook for the retail grower is not very rose colored; in many parts of the country the labor troubles have curtailed the incomes of many of the florists' best customers to a great extent and the weather this spring was against plant sales. Another trouble was over production, and some growers being afraid that they could not sell out cut prices, others, to make sales and gain new customers did the same, and to meet them all the others had to follow these examples. Now there is no reason in this age of florists' clubs, why the florists should not fix plant prices in spring in each city, the same as the milk man or coal or ice dealer, of course taking a good clean well grown plant as a standard, I do not mean that the florist should fix an exorbitant price on his goods, but have a living profit. Where is the money in good 4-inch geraniums at one dollar a dozen, and deliver them at that? Other plants in proportion. Now gentlemen, tell me the use of trade associations and societies, when there is no uniformity of prices, and no standard of what constitutes a good or first grade plant; when there are so many petty jealousies and spites among neighbors in our profession, all of which seem to culminate in trying to undersell each other. So just try next season to bury the hatchet, and if you have not a florist club in your city organize one; then all sell at one uniform price and you will find more profit and a much better feeling in the craft.

Another source of trouble in the trade in many parts of the country is parties with no experience in the business organizing floral companies and cutting rates; men who may be able to run a dry goods or grocery store, but who, after six months on the board of directors of one of these concerns, knows more than a man who has had a life-long experience in the trade, and who when they start in business, look down on the florist who knows his profession with contempt, and begin to tell how long it will be until they burst so-an-so up; that they are going to run the trade in that town, etc. Of course they begin to run it by cutting prices to gain customers, and sometimes they make some money, but generally wind up by making an assignment, and in their brief but meteoric career work a great amount of harm to the trade.

Now if you can't make it go in the lines you have been working on, try and make a change; do not keep going out in on in the old rut. If carpet bedding is going out in your town, why don't grow so much of that class of stuff, grow more of the lines that you got most money from; also try and educate your customers to better things. You must play the role of instructor in many places and work the public up to a better knowledge of plants and flowers. In many places the florists are using

the same stuff now as ten years ago, and say "What is the use of doing differently; the people here send to such-and-such a city for their plants and flowers." Now if you only grew that stuff at home they would not send away for it. Whenever you see anything of that come into your town try to excel it next time, and you will keep trade at home.

Another thing is you must make your places attractive; do not allow your houses to be dirty and littered up with rubbish; it makes me tired to have a florist tell me he is so busy that he can not keep the place clean. It shows a lack of system, and you never see good stock on a dirty place. Nothing will keep ladies out of a greenhouse like narrow dirty walks and dusty dirty sheds; a lady will always patronize the establishment where she can keep her skirts clean, and I notice in an extended trip amongst the trade this season that the men who had clean and attractive establishments did not complain of hard times, but were satisfied with the amount of business done.

While it behooves every florist to practice economy this season still the outlook is not so bad as some pessimists and croakers make it out to be, and I think that trade will be fair. Another reason for the hard times cry with florists is that many have too large an establishment for their capital. The large sales and good prices obtained for a few years back have caused many to enlarge their establishments too much, and then when prices fell as they naturally did from increased production and no corresponding increase in the demand, they were unable to meet their payments and that caused a lack of confidence in the trade. While there has not been much increase in new glass this year I think that it will tend to make trade better this season, and I think the florist trade will be in a healthier state this time next year than it is now. One thing is sure; in proportion to the capital invested there has been a smaller amount of failures in the florist trade than almost any other line of business, and somehow the members of the craft always manage to pull through every financial storm in tolerably good shape. I feel sure that trade is going to show a healthy increase next season, for taking this season as a business criterion, and the univeral stagnation in every trade, the florist and nurseryman have no reason to complain. They have done well, and if they only hold together and stop cutting each other's prices there is money in the trade yet.

Hackensack, N. J. JAS. S. TAPLIN.

Chicago.

Mr. J. A. Pettigrew has accepted an appointment as superintendent of the parks of Milwaukee, Wis., taking charge August 1. The city has some 400 acres of parks, a considerable portion of which is yet to be improved. While Chicago horticulturists regret exceedingly to see Mr. Pettigrew go elsewhere they rejoice that his new field of labor is not far distant and that consequently they may hope to see him at least occasionally in the future. Milwaukee is to be warmly congratulated on securing the services of such an able man. If the necessary sinews of war are provided he will surely make Milwaukee's parks merit a national reputation.

Business is as dull as ever. The supply of roses is not very large as yet, but more than enough for all demands. Although the quality is improving, on the whole the average is extremely poor yet. Meteor is fairly good, though the flowers are by no means of so good a quality as this variety is capable of producing in summer. The best selected stock sells at $3. Beauties are coming forward again in good shape; some fairly long stemmed stock may be had which bring $1 a dozen, with an occasional extra fine lot a few points higher. La France does not show up as well as in former mid-summer seasons; the flowers are small and soft; price $2 for the best. A few good Testout and Kaiserin are seen which are in good demand at $3. The balance of the list, which constitutes the great bulk, goes for anything it will fetch.

Blooms from field grown carnations are offered freely but meet with small demand. The flowers are very small, owing to the continued drouth. The plants are reported as suffering severely in many localities, and unless there are rains soon the fields will be badly damaged.

The retail trade is in as stagnant a condition as ever. Joe Curran did a decoration last week which was unique if nothing else. The occasion, as announced by the Fellowship Club, was the annual picnic at Kinsley's woods. The "woods" were planted by our friend Joe in Kinsley's ballroom, and were altogether a good imitation of a certain style of picnic ground. Trees and hedges of arbor vitæ, a fountain in the center surrounded with bedding plants in bloom and pond lilies floating in the water, constituted the decoration. But stop, we must not forget the artistic lager beer signs which adorned the woods everywhere, and such placards as "Keep off the grass" (green sawdust in this instance), "Dogs not allowed in this park," "Beware of pickpockets," and other even more suggestive signs. Neatly hidden in a cozy arbor of fragrant greenery might be found the regulation beer keg on tap. The conception and execution of this "decoration" did great honor to the genius of our friend Joe, and unquestionably proved his familiarity with the subject. The scene was inspiring, for as we left the "woods" we caught sight of the bill of fare, which included such trifles as red herring, pretzels, Wiener wurst and sauer kraut, Limburger cheese, etc.

Owing to an oversight by the secretary no notice of a meeting for the club last Thursday was sent out. In consequence there was no quorum present, but as there is some very important business which should be acted upon at once, a special meeting was called for Thursday next, August 2. Elections of officers to fill vacancies caused by resignations will be held. Members are urgently requested to attend.

Recent visitors: Mr. S. B. Parsons,

INTERIOR OF PANTHEON.

DECORATIONS AT THE FUNERAL OF THE LATE PRESIDENT OF FRANCE

AT THE PALACE OF THE ELYSEE

DECORATIONS AT THE FUNERAL OF THE LATE PRESIDENT OF FRANCE.

Superintendent of Central Park, New York; Harry Balsley, Detroit, Mich.

The "Chicago wholesale Florist Club" has been organized, its objects being "To cultivate social relations, afford mutual protection against dead-beats, delinquents and frauds, and advance the interests of the trade." The officers are Flint Kennicott, president; Geo. Harrer (of Niles Center Floral Co.), vice-president; Geo. Klehm, secretary and treasurer. Other members are J. B. Deamud & Co., Corbrey & McKellar, Olsen & Hughes, Geo. Piepgras, A. G. Prince, A. L. Randall, Reinberg Bros.

Philadelphia.

The man who is in prison for stealing from a florist and who tried to commit suicide a week or so ago was working for Messrs. Myers & Santman of Wyndmoor at the time of his arrest. Habermehl & Brother of 22nd and Diamond had been on the lookout for him for some months, he having stolen $75 worth of plants from them while in their employ last fall. Messrs. Myers & Santman say that he was a good worker, being very industrious. They have found out since he has gone that they also were being systematically robbed, and many little things lost and missed have been found to have gone through his agency.

Mr. Robert Craig has also had some experience in this line recently. For the past year or two he has been missing tools, particularly valuable steam fitting implements and other articles that could be conveniently carried away. Finally Charles Calnan, a trusted employe who was about to leave, was suspected and on being arrested and his house searched a great number of the missing tools were found. He is now awaiting trial.

Harry Waterer has returned from a visit to his home in England. He reports having had a very good time. During his stay he saw some very fine carnations, much larger than fine flowers here. They were borne on good stout stems from 8 inches to a foot in length, but each flower had to have a small rubber band around the calyx.

S. S. Pennock is now handling short white carnations by the bushel.

C. J. Pennock of Kennett has planted about an acre of carnation Mrs. Fisher, which he finds is a good summer blooming variety. From the way they are coming it they would seem to be as free as balsams; 50 cents per hundred is the price, but if 500 to 1,000 lots are wanted a little whispered consultation takes place and the dealer generally goes away satisfied.

Mr. Wm. F. Eaton of Girard avenue is all smiles. It's a boy. Congratulations, Billy.

Business the past week has been fairly good for this season. The heat has been something terrible. The ground about here is very dry and parched and rain is badly needed.

James Verner has moved his establishment from Darby to Lansdowne. It was not a very laborious undertaking, as it never existed in Darby except on paper.

K.

Boston.

Inquiries regarding the bedding plant trade in this section elicit the fact that in general this branch of the business has been more unsatisfactory this season than for years previous. The season was shorter, prices lower and the general demand not up to the average. The prices at auction showed a decided fall throughout the list.

Owing to a light crop of Southern fruit and vegetables all the peddlers in the city turned their attention to selling plants, and knowing nothing about the trade slaughtered prices early in the season and recovery was impossible.

The hydrangea seems to have gone where the agaves went a few years ago, "into innocuous desuetude" as one grower puts it, and the palm and the rubber are spoken of as likely to take its place. Taken as a whole, considering the low prices and the very slow collections the bedding plant trade for 1894 has not left a very brilliant record.

Saturday, July 28th, was sweet pea day at Horticultural Hall. The display was not as extensive as on some former occasions but those that were shown were very fine blooms. With the exception of a small collection from the Bussey Institution in which the flowers were shown with the pea foliage, none of the exhibits were entitled to any credit for the manner in which they were put up. Some of them could not be much worse had they been arranged by a five year old child. H. B. Watts was awarded first prize for display of named varieties and F. H. Blake first for general display.

Nothing finer in the line has been seen in this hall for a long time than the collection of sixty varieties of petunias shown by L. W. Goodell. The advance shown in substance and size of flower and novelty of coloring since Mr. Goodale made his last exhibit three or four years ago was something remarkable.

W. J. Martin, gardener to N. T. Kidder, was awarded the Society's silver medal for an exceptionally well grown and flowered plant of Ixora Dixiana, which occupied a central position on the stage and attracted much attention. A dish of enormous mushrooms, a rare sight at this season, won for Mr. M. J. Murphy a first-class certificate of merit. Mr. Roy showed several good bunches of hot house grapes.

N. F. McCarthy and W. H. Elliott will

go on a cruise on Mr. McCarthy's yacht on August 3. Their destination is Nova Scotia, where they expect to spend a week camping in the woods. The last time Mr. Elliott camped out he slept with his feet too near the fire and burnt his moccasins off.

Trade in cut flowers is exceedingly dull. There is nothing doing except a little funeral work. Bar Harbor, which has in former seasons been a good July customer for Boston, is sending for disposal in this market Laings, Brunners and Neyrons which beat anything that can be grown in midsummer here. Geo. A. Sutherland is receiving them.

Mr. Michael Barker, for some years employed at the Harvard Botanic Garden, is leaving that place to accept the position of superintendent of the experiment grounds at Cornell University. Mr. Barker hopes to find a way to be of some service to the commercial growers in his new charge.

A very welcome visitor to Boston during the past week was Prof. J. F. Cowell of Buffalo, who was making a little tour of inspection of the Arnold Arboretum and the Harvard Botanic Garden.

Cincinnati.

No use talking about business, as that is an unknown quantity in this market now. The great event has come and gone, but with pleasant recollections. I have reference to the first annual outing by the Cincinnati florists, held at Woodsdale Island Park, Thursday, July 26. One special train of six coaches and baggage pulled out of the C. H. & D. R. R. depot at 9:05 a. m. and by the time we reached Lockland, "the home of Frank Pentland," we had on board 350 people, including the growers, store men, their wives, children and sweethearts. We arrived at the Island at 10:30. A short description of Woodsdale will not be out of place. It is situated on the banks of the big Miami river and Miami canal, 35 miles from Cincinnati, amid handsome old oaks, oleanders and flower beds; inland is a beautiful little lake for row boats, at the west end of the island is the pony track, while at the east end is the base ball park. The committee composed of Ben George, William Murphy and E. G. Gillett had mapped out a program for the day and were busily engaged putting same into execution. The first event on the program was game of football; sides were chosen by Otto Walke and E. S. Johnston, and P. LaFever tossed the ball. Next in order was the quoit pitching contests under command of Colonel Thomas Jackson of Covington, Ky. For this was given a solid silver cup suitably engraved; this prize was won by Robert A. Murphy of Delhi, O. Next was the bowling contest; silver cup to party making largest score with three balls. In this contest there were 55 entries; the winner was Albert Heckman, Covington, Ky. After dinner donkey race was called; 5 entries, Albert Heckman winner. At 2 p. m. the boy's foot race was called. Prize 50 cents won by Willie Sinfoot of College Hill. 2:15 p. m. foot race open to all, and won easily by Chas. Critchell against a dozen contestants. Prize a florist budding knife. 2:20 p. m. foot race for little girl, prize a bisque doll, and won by Jennie Kallath; 2:30 p. m. foot race for "florists only," won by Chas. Critchell, who can run like a deer. Next foot race for young ladies, prize sterling silver spoon, and won by a long reach by Miss Carrie Nolte. At 2:50 p. m. the fat man's race was called. To see these monsters toeing the scratch awaiting the word was a sight worth going miles to see, and then to see them sprint after they got the word. I will say right here that the temperature was about 85°. This race caused no end of amusement especially to see Geo. Walker, janitor of our floral market, run. He fairly cut the air, but the race was won by Ed. Snider, Walker a close second. This prize was a leather medal. This ended the foot races and after everybody had taken a glass of —— *water* we proceeded to the river to watch the regatta, the prize in this race being a silver cup, J. D. Garnson winning by half a length; Wm. Critchell a close second; Ed. Jordan won the leather medal for coming in last. The greatest event was the ball game between the growers and storekeepers. For this we also had a prize, a silver cup to the player making the largest number of base hits. This was won by Voss of College Hill, and the game won by the growers; score 13 to 4, 5 innings; umpire Chas. Rentz. To see Will Murphy of the growers' team sending in the balls from the pitcher's box was fun. He fairly made monkeys of the store boys, and to see Theo. Bock's whiskers splitting the air as he tried to make first base is a sight never to be seen again "until next year."

At 6:45 p. m. our train steamed out for Cincinnati, carrying 350 tired people, all declaring they never had so good a time and all stating that the first annual outing of the Cincinnati florists was a success. G.

St. Louis.

After weeks of hopeless longing a good heavy rain has put an end to the most protracted drouth that has been known here for years; for more than a hundred days there has not been precipitation enough at any one time to be called a rain, and the condition of crops can better be imagined than described. Grass in many places outside the reach of water is dead, and many ornamental trees and shrubbery have yielded up to the lack of moisture.

The first picnic of the florists of St. Louis and their friends came off at Meramec Highlands on the 25th, and from all accounts may be pronounced an unqualified success; a few of the details did not work as smoothly as expected, owing to the rules prepared by the committee not being quite definite enough. Outside one or two small jars, however, everything was thoroughly enjoyed. The committee having the matter in charge arrived on the grounds early in the day, accompanied by quite a few florists, and had things in good shape to be disposed of when the majority arrived. The athletic events were the first things to be decided, and owing to the number of entries in all of the events the greater part of the afternoon was spent in watching the struggles for supremacy. In the first event, the 100-yard run, a surprise was in store for the boys in the shape of Mr. Sutton, who came prepared to win, equipped with spiked shoes and a strong backing; the question was raised as to his eligibility but was waived on Mr. Connon's statement that he was all right. The preliminary heats were won by Sutton, Teasdale and A. Y. Ellison; and the final by Sutton, with Teasdale a close second. The running broad jump with seven entries narrowed to a contest between C. Beyer and R. F. Tesson, Beyer winning with a jump of 15 feet 11 inches. The potato race for boys and girls 15 years and under resulted on the first trial in a tie between Harry Ellison and Oscar Benecke; in the final Oscar Benecke won, and imposed upon Jules Benecke the task of getting a croquet set home. The slow race of 100 yards gave an excellent illustration of how slow a florist can become, and at the same time neither stand still or go backwards; it was won by C. Juengel, there still being several back of him at the time limit, the cane won being carried proudly during the balance of the day. The sack race was given over to the boys entirely when the number of entries was seen, and resulted in a win for Fred Weber, Jr. The three legged race was the most amusing feature of the afternoon's sport, as well as being the most hotly contested event on the program; two preliminary heats were run, the first being won by C. Beyer and A. Bruner, the second by C. C. Sanders and R. F. Tesson. The run off to decide the winners resulted in a tie, both having reached the tape at the same time, necessitating another trial later in the afternoon, in which Beyer and Bruner were the winners. The 50-yard run for boys 14 years and under was won by H. Ellison, and the 50-yard dash for silver cake stand, open to ladies, was won by Mrs. Bruner. The egg and spoon race for ladies and girls was captured by Sadie Young, the prize being a handsome fan. Sides were chosen by C. Young and J. Kunz, and in the pull that followed Kunz's team won, mainly owing to the heavy work of Herzog. When the above events were finished a photograph was taken of a majority present, and an adjournment was held for supper, after which the bowling contest commenced. Owing to the number of entries it was found impossible to roll more than one game, so the prize provided for the highest average was given to the second highest individual score. The scores made all through were poor, the winning scores being as follows: first, C. Young, 190; second, R. Beyer, 169; the booby prize going to J. Kunz, for a total of 40 pins. The dancing and boating were much enjoyed during the afternoon and evening, and when train time came all united in pronouncing it a most enjoyable day, and spoke of the affair as a fixed yearly event. The train as it pulled into and out of Gratiot station was given an illumination by Mr. Herzog, whose greenhouses adjoin the depot, and which was responded to by the boys.

E. H. Michel and wife are visiting in Texas. Will Young leaves for the east, via Cincinnati and Springfield, on the second. R. F. T.

Cleveland.

The down town florists have signed an agreement to close their respective places of business at seven p. m. excepting Saturdays, and at 1 p. m. on Sundays for the summer months only. This is a move in the right direction. Only the hours on Sunday are too long yet. We have known some of the leading stores not to have over one to two customers come in after six o'clock for days in succession and said customers only buy a carnation or rose for the button hole, which of course does not pay for the gas, not to mention the heating the store gets from the gas, spoiling what stock there is on hand outside the refrigerator.

Mr. A. Campbell, on Cedar avenue who lost nearly all his glass during the severe hail storm last spring, has offered his property for sale and will quit the business entirely providing he can sell, otherwise he may patch up the old houses again.

Mr. Charlesworth is busy tearing down his houses on Sibley street, and will build eight or nine houses on the lot adjoining his greenhouses on Doan street. His down town office will remain on Sibley street a few doors farther east.

W. T. Long of Arcade Rose Houses fame, has forsaken the trade and turned his attention to other business. The houses built recently by him on Doan street are empty and in the hands of a real estate agent.

The Cleveland Floral Co. have added five good sized houses and will build three more. This is the plant established by J. C. Gooding. Frank Wiedner is the florist in charge.

One of the best kept of the smaller establishments in this neighborhood is the snug place of Mr. Fred Aul, in Glenville. Everything is in apple pie order. There are five good sized houses and two acres of fine soil nicely located. His residence is heated throughout with steam furnished from the boiler at the greenhouses. Mr. Aul bought this place some two years ago, and since then it has more than doubled in value. L. F. D.

Buffalo.

There is nothing very new in our line since my last. Weather warm and dry, but not so dry as many other localities. Our stores are gay with Japan lilies, gloxinias, Beauty roses, water lilies and mud turtles. All of it is mostly for display, for business is naturally dull, but scarcely duller than this time in former years.

As Rochester did not seem to care to play the Buffalo boys this year at the national game we had to get up a game among ourselves, East Side vs. West Side. It's humiliating to have to announce that the plebeians from the East Side bested the West, but you know the element from which both ball players spring. There never was a better general turn out of the trade on any previous occasion. With a few insignificant exceptions everybody was there, from the veteran W. J. Palmer down to the smallest errand boy, embracing all ages and sexes, color and conditions of life. The score was 17 to 6 in favor of the Dutch. A detailed account of the game would not be of any interest; suffice it to say that the battery for the East Side were S. Jones, pitcher, S. A. Anderson, captain. The latter wore a bathing suit. Most of the ladies wore blue glasses on that account. For the West Side W. Belsey, Scott, pitcher and Phillip Scott captain. The battery work was on both sides far in advance of the play of any of the rest. Mr. D. B. Long was in right field and the only ball coming his way he handled as gently as he would a Mme. Testout rose, so that it escaped between his legs. Mr. Mepsted sat on the refreshment box most of the time, and as the weather was fearfully hot he became perfectly exhausted opening the lid. Altogether it was a most enjoyable afternoon, and it took place at Elmwood Beach, one of the many summer resorts of the Niagara river on Grand Island.

Four beautiful girls from Chicago delighted us with a call last week. They were Miss Anna Kreitling and the three Misses McDonald. They were out to see Buffalo, Toronto and the Falls. There is courage and self-reliance for you. They were having an excellent time all to themselves. Nothing but an important business engagement prevented the writer from having the honor of showing them over at least part of our beautiful city. We sincerely hope they arrived home in as good spirits as they were blessed with in our short interview. Their account of business in Chicago made us realize that we still live.

It's quite indefinite how many from here will go to Atlantic City. At present it looks like a good delegation. They will leave at 10 p. m. Sunday on Delaware, Lackawanna and Western R. R. via Philadelphia. Friends and acquaintances are respectfully invited to attend. W.S.

WESTERLY, R. I.—S. J. Reuter has nearly completed several new houses at his place on Beach street.

ELLIS, MASS.—There has been a change in the firm of Peter Fisher & Co., and it is now Fisher & Aird.

BROOKLYN, N. Y.—Henry Meyer has moved back to his old place at 60 Harman street, where he will continue the business, confining himself to retail trade.

OSHKOSH, WIS.—Isaac Miles & Son have just completed two houses 67x20, and one smaller. They will heat with a Hitchings boiler.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

FOR SALE OR RENT.

Two large greenhouses 100 feet long by 18 feet wide, containing 5000 feet of glass; built two years ago, with all modern improvements, by the late John F. Nitterhouse, practical florist. Greenhouses situated ½ mile from town; convenient to two railroads, and stocked with roses, carnations, etc. Possession given Oct. 1st. For further particulars address MRS. S. J. NITTERHOUSE, Waynesboro, Franklin Co., Pa.

Greenhouses to Rent.

At Moorestown, Burlington Co., New Jersey, nine miles from Philadelphia, on railroad, four houses, 10 000 feet of glass, two boilers. Sp'endid opportunity.

JOS. T. SULLIVAN, Moorestown, N. J.

For Sale or Rent.

One of the largest and most successful plants in the State of Ohio, consisting of about 50,000 feet of glass, with three or six acres of fine land; houses all in the best of order, and as good as new; adapted to cut flowers. Reasons for selling, the increasing demand for the Standard Ventilating Machines demands more of my time than I can possibly give it and run the florist business. For particulars address E. HIPPARD, Youngstown, Ohio.

FOR SALE.

Six (6) greenhouses, two hot water boilers, about 2000 feet 2-inch wrought iron pipe, valves, etc., lot of hotbed sash, frames, benches and about 35,000 flower pots. The entire plant will be sold at a very low cash price, as the whole must be removed off the premises before Sept. 1st. For particulars address L. R. MUNN, Station C, Brooklyn, N. Y.

FOR SALE CHEAP.

Six small greenhouses in the best health resort for invalids in the United States, heated with hot water; good retail trade, close to Casino and Club House, two acres of ground, six-room cottage plenty of room to increase plant, expense of running small, no incumbrance on property; reason for selling, too old for the business. For particulars address WM. M. FLINN, FLORIST, Box 296. COLORADO SPRINGS, COLO.

Address THE AMERICAN FLORIST CO., Chicago.

OBITUARY.

At Woburn, on July 25th, aged 49 years 10 months, after a brief but most painful illness, died Mr. Edwin Gridley Bridge, of cerebritis.

The deceased was born in Boston, but some years ago moved to Somerville, N. J., where he had a large farm and was also in the ice business. Three years ago this fall he returned to Massachusetts on account of his health and settled in Woburn, where he bought a nice property and erected a modern style carnation house, from which during the last two winters he has cut some of the finest carnations that have been sent into Boston.

He was a most enthusiastic, painstaking grower, giving his whole attention to his business, a firm believer in the bench system, careful manuring, and in his own words "Light, light, light."

It was a treat to visit him, for one was always sure of a hearty welcome and his "place" was ever the picture of neatness and cleanliness inside and out, and in the course of the conversation, one could not help but pick up several useful ideas from so close an observer.

He was honored and respected by all who knew him. The craft can ill afford the loss of such a man. I.

Water Snails.

Aquatic plants have their enemies in the line of various insects, parasitic and other pests, as do other plants, terrestrial and epiphytal. Cultivators are sometimes confronted with what they least expect. The water snails hold a dual relation to the aquarist and cultivator of aquatic plants. The common water snail (Linnæa auricularius) is a most desirable species, and a few specimens in tubs and tanks, and especially such where seedlings and young nymphæas are grown, will prove very beneficial, and are preferred to fish, as they will keep the water and the young plants clean of algæ, which at times is very troublesome, and numbers of plants are lost in consequence. They will feed on dead leaves and decaying vegetable matter, and never eat a green leaf. They are benefactors and among the cultivator's best friends; this can not be the species your correspondent is desirous to get rid of, but there are several species, and one which I have met eats live plants as well as algæ and decayed vegetable matter. It has an especial liking for Aponogeton distachyon, limnanthemums, and some varieties of nymphæas, which is probably the species referred to. The only way to exterminate them is by hand picking and a goodly number of gold or other fish in the water. These will eat the larvæ, thus cutting off the increase, but as they can not eat the mature snail the only resource is hand picking. Fish will also eat the larvæ of Linnæa auricularius, so the cultivator must use discretion, and not allow fish in tanks where he wishes to preserve the snails. WM. TRICKER.

Chicago to Atlantic City.

The Chicago Florist Club has secured a special low rate to the S. A. F. convention at Atlantic City, over the Pennsylvania railroad. Train leaves Chicago at 3 p. m. Sunday, August 19, passing over the Allegheny Mountains in daylight and reaching Atlantic City Monday evening. Florists in the west and northwest who wish to join the party are cordially invited to do so. Berths may be reserved and further information obtained by addressing the chairman of the Chicago Club's committee, Mr. G. L. Grant, 322 Dearborn street, Chicago.

Cincinnati to Atlantic City.

Satisfactory rates have been obtained and quite a party will go from here. For full information address E. G. Gillett, 134 Walnut street, Cincinnati, O.

St. Louis to Atlantic City.

The St. Louis Club has secured very favorable rates. For full information address the secretary, Mr. E. Schray, 4101 Pennsylvania avenue, St. Louis.

A VERY complete exhibition of fruit will be made at the St. Louis Exposition from September 5 to October 13, 1894. It will be in charge of the Missouri State Horticultural Society, of which L. A. Goodman, Westport, is secretary.

Going to the Convention in Atlantic City?

You'll miss it if you don't, and your family should be with you, as we will be on hand with a display of

Long's Florists' Photographs

and wish to show them to everybody. Meantime you can have a catalogue of them by applying to

Nebraska Seed Crops.

Under date of July 27th our correspondent reports no rain since July 23rd. There will be acres of corn that will not make anything. Considerable of Stowell's has been injured past recovery, while other kinds are suffering considerably. Vines, especially melons, will do better as they can stand more drought. Cucumbers are suffering most. The vine crops will certainly not be too large this year, and if there is no shortage it will be because of the seed carried over.

ANOTHER REPORT, July 27, from Waterloo, states that a very hot withering wind the past week, with thermometer from 90° to 110°, has done a great deal of damage to the corn crop.

SEED CROPS.—From Rochester we learn that the prospects for beet, beans, turnip and corn in that vicinity are good. The acreage planted to turnip seed is small, owing to the short crop of roots. Beans are unusually promising. Late crops of corn will depend largely on open and favorable fall.

BOUQUET GREEN OR PRINCE'S PINE may be scarcer next year on account of the severe and extended forest fires now raging in that portion of Wisconsin where this stock is largely produced.

CALIFORNIA REPORTS June 27th good crops of nearly everything. Expect to fill orders. Onion harvest will not be on for nearly two months yet, but we do not anticipate a shortage.

A. UNGER of BOEHMER & Co., Yokohama, is passing through the United States on his way home from Europe.

CONVENTION NUMBER.—We shall issue our annual Convention Number August 16. Send copy for advs. as early as possible. No increase in rates.

DO YOU WANT a list of firms in the trade that issue catalogues, with key showing proportion of space given each branch of the trade in same? You will find such a list in our trade directory and reference book for 1894. Price $2.00.

THE AMERICAN FLORIST and *Gardening* together to one address for $1.75. Send orders to the American Florist Co.

Grow Swainsona.

The best and most profitable pure white flower grown. Takes the place of Roman hyacinths or lily of the valley, producing spikes of flowers from 4 to 6 inches long, in the greatest abundance the entire year—never out of bloom—lasting well when cut. 100 Swainsona will pay you three times as much as same space in best carnations. No florist should be without this most useful flower. After a trial it will be considered indispensable.

EASY TO GROW.

An exceptionally good and paying cut flower.

Strong young plants, $1.00 per doz.; $6.00 per 100.

Larger ones, $1.50 per doz.; $10 per 100.

Trade Catalogue on application.

What do YOU know about making a Catalogue?

Mighty little, probably! Why should you? Grow plants and buy bulbs—that is your trade. Of course, you can make a LIST of what you have, and what prices you want. But can you get the great American public to read it, and buy the stuff as freely as you would like?

WE know something about making Catalogues. Ought to, after half a generation of trying! Send us that list and prices—we'll make a pulling Catalogue with it, and **sell the stuff** for you. We're not mere printers—we MAKE Catalogues all the way through if you want that done, including writing, illustrating and printing—even mailing. Write us about your fall Catalogue. You don't go to a blacksmith for medicine when you are sick, do you? We'll cure that sick fall business for you—just let us try!

NOW is the time for a **bulb Catalogue THAT WILL PAY.** Write us to-day!

THEO. BOCK, Hamilton, O.

Lenox, Mass.

The reception given the Gardeners' and Florists' Club of Pittsfield the evening of Saturday, July 21, by the Lenox Horticultural Society, was a great success, and was undoubtedly the largest gathering of professional gardeners ever held in Berkshire county.

Twenty-six of the Pittsfield boys came down with Viner's four-in-hand, 45 were present from Lenox and vicinity, and invited guests brought the number up to 80. W. A. Manda, of South Orange, N. J., and Charles B. Weathered, of New York, were present, coming up expressly to attend the banquet. Before the reception the home society held its regular meeting and elected nine ordinary members.

The society was organized February 12, 1894, with 12 members; now the membership numbers 65, and there is $400 surplus in the treasury.

After the business meeting the guests were shown the new rooms the society has just taken in Sedgwick Hall, and which were fitted up expressly for it.

At 9 o'clock the company formed in line and marched to the Bellevue hotel, where a regular English gardener's dinner awaited them. There were four long tables loaded with good things for the inner man and decorated with choice blossoms from the garden, sweet peas predominating. After the contents of the tables had been placed where they would do the most good, and cigars had been lighted, the speeches and fun for the evening began, President Norman presiding. Mr. Russell, of Stockbridge, sang several selections which were greeted with applause. Mr. Huss gave an address of welcome to the visitors. Charles Weathered, of New York, congratulated the society on the work done in the short time it had been organized, and said that in his opinion the garden of Eden was situated in Lenox. He referred to the natural beauties of Lenox and the large number of professional gardeners employed in the vicinity, and said that there was no place east of the Mississippi river where there were so many gardens cared for by professionals as in this vicinity, and that there was need of the two societies. He predicted that in a year the Pittsfield and Lenox societies would be the two largest in the U. S. outside of the largest cities.

Mr. Manda, of South Orange, N. J., spoke of the fine gardens in Berkshire and of the pleasure and good derived from flowers. Mr. Breed, of Captain Barnes' place, entertained the company with a song, and James Clifford and Martin Finaghty told of the great change in the gardens of Lenox in the past 20 years and of the intelligence and skill necessary to care for the Lenox gardens as they are cared for at the present time. Other interesting and lively speakers were Messrs. Meredith, Clifford, Griffin, Wingett, Sencord, Savage and Edwards.

The members of the Lenox society may well be proud of their success as workers and as entertainers.

HOPKINTON, MASS.—H. O. Cheney has purchased the florist business of L. L. Woolson and will remove it to Bear Hill.

COLUMBUS, GA.—Chas. E. Meehan will build a greenhouse 16x160 on Musgrove street.

SALEM, MASS.—McGee, Geary & Co. are making extensive alterations and improvements in their office. An entire new front with plate glass exhibition window has been put in.

PANSIES...

Every Grower Claims the Best.

I am willing to have mine tested alongside of any in the market. Over a thousand florists used them last season, were pleased with them and made money out of them.

Between Sept. 1st and Dec. 1st I will have a MILLION or more plants to sell. They can not be offered in competition with cheap grown seed, but quality considered, are remarkably cheap at the price.

By Mail or Express, prepaid, 75c. per 100; by Express at your expense, $5.00 per 1000. Liberal discount will be allowed on large orders.

An honest sample of the plants will be mailed you on receipt of ten cents, and terms are absolutely cash in advance.

ALBERT M. HERR, L. B. 496, Lancaster, Pa.

ZIRNGIEBEL GIANT PANSIES.

Owing to favorable weather, have been magnificent this season. Never before have we obtained such size and colors; and as usual, wherever exhibited, have eclipsed everything else, receiving also the most flattering testimonials from the leading florists and seedsmen all over the country.

New seed ready now of both the Giant Market and Giant Fancy in trade packets of 2,000 and 500 seeds respectively at one dollar each, with practical directions for growing pansies. Also plants for sale later on.

DENYS ZIRNGIEBEL,
. . . NEEDHAM, MASS.

Pansy ★ Seed.

The JENNINGS STRAIN of high grade Pansy Seed. New crop now ready. Saved with special care from only the very finest varieties and (warranted) first-class in every respect.

THE JENNINGS XX STRAIN.

The cream of Pansies. Grand colors mixed. pkt., 1500 seed, $1.00; 1 oz. $8.00.

The Jennings Strain, finest mixed, pkt. $1.00 about 2500 seed; 1 oz. $6.00; 3 ozs $15.00. No skim milk in this strain. (They are just as good as I can make 'em). To my old patrons I would say they are a big improvement over last season—more variety and finer colors. The best strain for florists either for winter bloom or spring sales; all large flowering.

Black Dr. Faust, finest. pkt., 2500 seed, $1.00
Finest Yellow, black eye..... " " 1.00
Pure White, the best..... ... " " 1.00
Victoria, bright red..... pkt, 1000 seed, 1.00

All my own growth of 1894. Half pkts. of any of the above 50c. Please send money orders or registered letter. Cash with order. Address

ROBERT F. TESSON,
West Forest Park, St. Louis, Mo.

Clifton, N. J.

Clifton's chief product in the past has been American Beauty roses. In fact, no better Beauties are grown anywhere than those that hail from Clifton. But judging from present indications it will not be a long time before the Beauty will be obliged to share the honors with a rival, and Clifton will claim additional distinction as the great center for the aquatic plant industry in America.

The pretty little ponds originally started for individual pastime and pleasure by Mr. S. C. Nash have under the care of Mr. Wm. Tricker, with whom Mr. Nash has recently associated himself, been still further improved and beautified during the present season, and now offer a treat well worth a long trip to see.

Aquatics, from their beauty and variety as well as their association with the water and the vacation season, have always maintained a strong hold on the affection of flower lovers, and now that their usefulness has been so greatly extended and their only drawback removed by the acquisition of numerous afternoon and night bloomers it follows that the increased favor and prominence which they have attained in recent years will prove to have been not a transient fancy, but really only the beginning of a permanent popularity which is bound to increase rapidly.

The two gentlemen interested in the venture are enthusiasts on aquatics, and would undoubtedly be willing to miss a meal any time for the privilege of watching a Victoria regia open its blossoms. Go there at any time of the day at this season and you will find them at the ponds deep in contemplation of Marliaceas, Laydekeris, dentatas and Victorias, trying to decide as to whether the muskrat is a nuisance because he eats the nelumbiums or is a blessing in disguise because his depredations prevent the nelumbiums from taking possession of the whole territory to the exclusion of everything else; or, if at the houses you will find them carefully poking in the tubs among the tiny seedlings, keeping a sharp watch on black flies, algæ and snails and speculating as to the possibility of discovering or training a fish with sufficient good judgment to eat the destructive snail which hails from Long Island and at the same time spare the good and useful little snail which belongs in New Jersey.

The ponds devoted to the hardy aquatics are now a little past their best, while those containing the tender nymphæas and Victoria regias are approaching the height of their season. The variety cultivated is very extensive, and Mr. Tricker has a large number of hybrids which will presently be introduced to the trade. His efforts in hybridizing are devoted mainly to the hardy kinds.

The ponds are naturally very picturesque, being fed by abundant springs and bordered by native bog-loving plants in great profusion. The surroundings have been further beautified by planting ornamental reeds, grasses, irises, musas, cannas, asclepias, ricinus, etc. The number of visitors is quite large, and they all come away delighted with the exhibition and firm believers in aquatics. Mr. Tricker will have something to say on the subject at the Atlantic City meeting, and that it will be interesting is a foregone conclusion.

DO YOU WANT a list of the leading park superintendents of America? You will find such a list in our trade directory and reference book.

THE AMERICAN FLORIST CO.'S

DIRECTORY AND REFERENCE BOOK

FOR 1894

CONTAINS THE FOLLOWING:

1. The names and addresses of the Florists, Nurserymen and Seedsmen of the United States and Canada, the exact branch of the business each is engaged in being indicated.
2. A separate list of firms that issue catalogues, the space devoted to each branch of the business in each catalogue being also given.
3. A list of the names and addresses of superintendents of leading parks in the U. S. and Canada.
4. A list of the principal cemeteries of America at which the arts of the landscape gardener and florist are used in beautifying the grounds.
5. A complete, alphabetically arranged list of Roses in commerce in America, with class, habit of growth, date of introduction, name of introducer, and brief, accurate descriptions of the flower of each. Synonyms are also plainly given.
6. A complete, alphabetically arranged list of Chrysanthemums in commerce in America, with class, and brief, accurate description of each. Synonyms are noted and varieties that are very popular with American growers are designated by a star, and this year's introductions by a dagger.
7. A complete, alphabetically arranged list of the Carnations in commerce in America, with name of introducer, date of introduction and brief, accurate description of each.
8. Seasonable Hints for the year, arranged in weeks, written by Mr. William Scott, and covering every detail of a general florist business. This is decidedly the most valuable contribution to the literature of the trade ever published. It is written in a plain, practical way, by a man who knows what he is talking about.
9. A historical sketch of the Society of American Florists from its organization to date, including officers for each year and lists of essays read at each meeting, with other information of interest.
10. A similar historical sketch of the American Association of Nurserymen.
11. A similar historical sketch of the American Carnation Society.
12. A similar historical sketch of the American Seed Trade Association.
13. Similar historical sketches of the Florists' Hail Association of America; of the National Chrysanthemum Society of America; of the Florists' Telegraph Delivery Association.
14. A complete list of all National and Local Trade Organizations, with names and addresses of principal officers, time and place of meetings, etc.
15. Statistics of Commercial Floriculture in the U. S. from the last census.
16. Statistics of the Nursery Industry in the U. S. from the last census.
17. Statistics of Seed Growing in the U. S. from the last census.
18. A list of Leading Horticultural Societies, with name and address of the Secretary of each.
19. Full information about Express and Postage rates on plants, shrubs, trees, seeds and bulbs

No less than 270 pages of valuable reference matter in compact form, and all UP TO DATE.

Toronto.

We have been blessed with several good showers this last week, which has put new life into the grass and flower beds, and the parks and gardens are now about at their best. The Horticultural Gardens are looking especially gay and well kept just now. I notice some very tasty beds of Verbena venosa and variegated stevia.

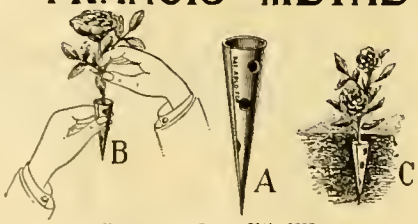
Manton Bros. give up their store on Yonge street this week, their lease having run out. They will grow for the wholesale and market trade now.

The annual picnic of the Gardeners' and Florists' Association will be held at Victoria Park on the 8th of August, when it is hoped that the boys will turn out en masse and endeavour to forget all about the hard times for a few hours at least. The park is on the lake shore a few miles east of the city, and easily accessible either by steamboat or electric cars.

The regular meeting of the association last week was well attended considering the season and that there was no very important business on hand. When once fairly under way though there was no lack of subjects to talk upon. Judges for the chrysanthemum show were chosen, and the secretary instructed to secure their services if possible. The date of the show has been set for the second week in November, subject to alteration if Thanksgiving day does not fall in that week.

In my last week's notes I omitted to mention the groups of plants at the late flower show, which are one of the principal and prettiest features; there is some taste displayed in the get up of these. Mr. J. H. Laing was first again with an arrangement in his usual good taste; every plant tells and shows its natural form. M. J. Cotterill was second with a lot of fine plants, but they were set up in the old style, formal bank, which does *not* show their form and only part of their beauty. Messrs Manton Bros. took third and the Horticultural Gardens fourth, the latter a great improvement in style on former endeavours, but it is wonderful how people stick to the idea that a group of plants must be highest exactly in the middle, and slope down evenly on each side. E.

Nashua, N. H.



Nashua has had a hail storm. Fortunately for the possessors of glass houses the hail stones were not large and the damage to glass was not heavy. A. Gaedeke & Co. suffered to the extent of one hundred lights more or less. C. H. Blake lost about fifty lights, and G. E. Buxton escaped without much damage. Alfred Chase, a market gardener, suffered severely as to his forcing house and outside crops. Considerable injury was done to trees and gardens. A large elm growing near the front door to Judge Hoitt's residence had one of its sections snapped off, although at the place of the break it was fifteen to eighteen inches in diameter.

Our trade directory and reference book for 1894 contains 270 pages of information of real practical value to every one in the trade. Price $2.00.

FRANK L. MOORE, Chatham, N. J.

WISHING TO INTRODUCE to the Florists our **Pan**, knowing what a good thing it is, we offer sample crates f. o. b. Detroit, which contains 51 5 inch, 24 6-inch, 21 7-inch, 20 8-inch, 16 10-inch and 15 12-inch, for $7.40 cash with order. This is the price we sell by the 1000.

Of the many testimonials that we receive we call your attention to the communications of two of the best known expert Florists in this country:

DETROIT, July 19, '94.

DETROIT FLOWER POT CO.

SIRS:—We wish to say that we have used the Pans (as made by you) for the past seven years, and find them very useful for many things, such as bulb forcing, window and table decorations, fern growing, and might say we find them almost indispensable around greenhouses and store. We grew a great many single stem "mums" in them—one in a 5-inch pan up to a dozen to fifteen in a 12-inch pan, and cannot recommend them too highly to florists.

Respt yours, JNO. BREITMEYER & SONS.

BUFFALO, N. Y., July 17, '94.

DETROIT FLOWER POT CO., SIRS:—Will mail you my order for Pans in a few days. Don't be afraid to make up a good stock of them, for when the florists find out what a good thing they are for bulbs, ferns, seed pans, etc., you will have a grand rush for them. I use them for forcing all bulbs, and find the 8 and 10-inch grand for Tulips, Romans, Narcissus, Daffodils. The 5, 6 and 7-inch for Ferns, Freesias and Valley, and any of the sizes are good for table or window decorations. I also find them a grand thing for growing "Mums" to single stem flowers; an 8, 10 or 12-inch pan with from 10 to 20 plants is a fine thing.

Respectfully yours, WM. SCOTT.

W. C. KRICK, 1287 Broadway, Brooklyn, N.Y.

For sale by all Florists' Supply Dealers.

Pittsfield, Mass.

Twenty-six members of the Gardeners' and Florists' Club from Pittsfield enjoyed a tally-ho ride to Lenox on the evening of July 21, the object point being the Bellevue Hotel, where they were invited by the Lenox Horticultural Society to help celebrate the occupancy of their new hall, and their phenomenal prosperity. A large number of the members at Lenox being also prominent in the Gardeners' and Florists' Club, we did not feel at all bashful and our part of the program was carried out to perfection.

About 80 sat down to a substantial dinner. An address of welcome was made by the ever vigorous Mr. Huss, and pledging their loyalty, friendship and good will to the Gardeners' and Florists' Club, which was duly responded to.

Among the speakers were Mr. Charlie Weathered of New York, Mr. W. A. Manda, South Orange, N. J., Mr. M. Finaghty, always enthusiastic, A. P. Meredith, Mr. Clifford, William Griffin, John White, A. H. Wingett, Seacord, Savage and Edwards. Several good songs were intermingled and a very pleasant night was spent, and the Pittsfield boys were proud for the first time that they were descended from old Adam.

W. M. E.

DO YOU WANT Mr. Scott's seasonable hints for the year in book form, so that you can refer readily to his suggestions for any week in the year? You will find them in this form in our trade directory and reference book for 1894. Price $2.00.

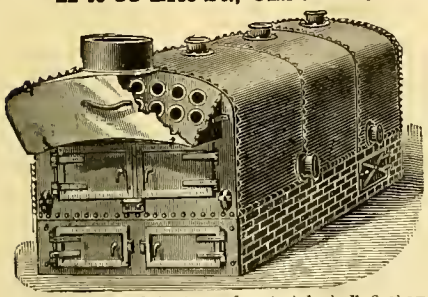
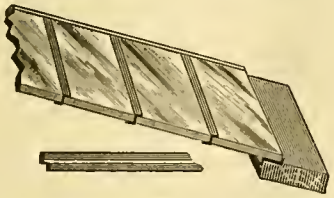
WATER
For Your GREEN HOUSE, ROSE HOUSE, NURSERY,
Conservatory, Lawn, House, Garden, Stock or any other purpose.
Send for Illustrated Catalogue
OF THE
DE LAMATER-RIDER AND DE LAMATER-ERICSSON
PUMPING ENGINE.



HOT-AIR PUMPING ENGINE.

Their operation is so simple and safe that a child can run them. They will pump water from shallow streams or any kind of well. They can be arranged for any kind of fuel. Capacity 1,500 to 30,000 gallons of water a day, according to size.



The De Lamater Iron Works,
87 South Fifth Avenue,
NEW YORK, N. Y.

Kroeschell Bros. Co.
IMPROVED
Greenhouse Boiler,
41 to 55 Erie St., CHICAGO.

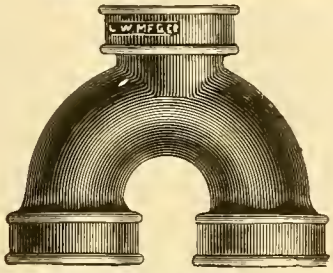
Boilers made of the best of material, shell, firebox sheets and heads of steel, water space all around (front, sides and back). Write for information.

IMPROVED GLAZING.

GASSER'S PATENT ZINC JOINTS for butting glass makes greenhouses air and water tight; also prevents sliding and breakage from frost. Does not cost as much to heat a house glazed with the joints, thereby saving enough in fuel to more than pay the additional cost of ginzing. The leading florists of the country are using them. Write for circulars with full particulars and price list.

J. M. GASSER, FLORIST,
Euclid Avenue, CLEVELAND, O.

THE CHAMPION
Automatic Ventilator.



The cheapest, easiest to operate, and by far the best machine in the market. Don't buy a Ventilator until you have seen my illustrated descriptive circular, which will be sent you free, giving prices, etc. Also Champion Soil Pulverizer and Sifter.

Address, **E. E. WOLF,**
Box 114. SPRINGFIELD, O.
